IN THE

United States Circuit Court of Appeals

FOR THE SECOND CIRCUIT.

THE NORTH AMERICAN COMPANY,
Petitioner,

against

SECURITIES AND EXCHANGE COMMISSION,
Respondent.

PETITION.

To the Honorable The United States Circuit Court of Appeals for the Second Circuit:

The petition of The North American Company respectfully shows:

1. Petitioner is a corporation organized and existing under the laws of the State of New Jersey, engaged in the business of holding securities for investment, and having its principal place of business in the City of New York, in the Second Judicial Circuit of the United States.

2. The Securities and Exchange Commission (hereinafter called the "Commission") was established under Section 4, Title I of the Securities Exchange Act of 1934 and is charged with the administration of the Public Utility Holding Company Act of 1935 (hereinafter called the "Act").

3. Petitioner seeks review of an order of the Commission dated April 14, 1942, entered in a proceeding initiated by a notice and order for hearing dated March 8, 1940, directed by the Commission against petitioner and various of its subsidiaries under Section 11(b)(1) of the Act. A copy of said order, dated April 14, 1942, is annexed hereto.

4. The notice and order for hearing, which initiated the proceeding, among other things directed petitioner to file its answer admitting or denying various allegations, among which was an allegation that:

> "The holding company system of The North American Company is not confined in its operations to those of a single integrated public utility system within the meaning of the Act, and to such other businesses as are reasonably incidental, economically necessary or appropriate to the operations of such integrated public utility system."

Section 11(b)(1) of the Act provides as follows:

> "(b) It shall be the duty of the Commission, as soon as practicable after January 1, 1938:
>
> "To require by order, after notice and opportunity for hearing, that each registered holding company, and each subsidiary company thereof, shall take such action as the Commission shall find necessary to limit the operations of the holding-company system of which such company is a part to a single integrated public-utility system, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system: *Provided, however*, That the Commission shall permit a registered holding company to continue to control one or more additional integrated public-utility systems, if, after notice and opportunity for hearing, it finds that—

(A) Each of such additional systems cannot be operated as an independent system without the loss of substantial economies which can be secured by the retention of control by such holding company of such system;

(B) All of such additional systems are located in one State, or in adjoining States, or in a contiguous foreign country; and

(C) The continued combination of such systems under the control of such holding company is not so large (considering the state of the art and the area or region affected) as to impair the advantages of localized management, efficient operation, or the effectiveness of regulation.

The Commission may permit as reasonably incidental, or economically necessary or appropriate to the operations of one or more integrated public-utility systems the retention of an interest in any business (other than the business of a public-utility company as such) which the Commission shall find necessary or appropriate in the public interest or for the protection of investors or consumers and not detrimental to the proper functioning of such system or systems."

5. On May 16, 1940, petitioner filed its answer to the above mentioned order admitting or denying various allegations and alleging as an affirmative defense the unconstitutionality of Section 11(b)(1) as applied to it. Such answer also sets forth various steps which petitioner proposed to take voluntarily, without, however, waiving any of its constitutional or other rights.

6. On June 7, 1940, petitioner moved to have the proceedings held in abeyance until petitioner had had an opportunity to take the voluntary steps set forth in its answer and until the Commission had made the investigations,

studies and public recommendations required by Section 30 of the Act. On June 18, 1940, petitioner moved for a dismissal of the proceedings on the ground that the Commission was without power to institute proceedings under Section 11(b)(1) until it had made the investigations, studies and public recommendations required by Section 30 of the Act, and further alleging that the notice and order instituting the proceedings prior to the making of such investigations, studies and recommendations would deprive petitioner of property without due process of law in violation of the Fifth Amendment to the Constitution. Both of these motions were denied by the Commission.

7. Hearings were held before a Trial Examiner of the Commission at various times between June 21, 1940 and April 15, 1941, at which evidence was introduced with respect to the extent, operations and relationships of the corporations in the petitioner's holding company system. On May 23, 1941, petitioner's requested findings of fact were filed with the Commission, together with a brief in support thereof. Counsel for the Public Utilities Division likewise filed requested findings of fact and a brief and reply brief, and a reply brief was filed by petitioner on June 2, 1941. Oral argument was had before the Commission on June 2, 1941, at which time the Commission took the matter under advisement and ultimately entered its order of April 14, 1942.

8. The order of the Commission dated April 14, 1942 directs petitioner to divest itself of substantially all of its assets, other than its investments in Union Electric Company of Missouri and its subsidiaries, and in The St. Louis County Gas Company and 60 Broadway Building Corporation.

9. The said order of April 14, 1942, provided that within fifteen days from the date thereof petitioner could file with the Commission a petition for leave to present further argument and proffer additional evidence with respect to the question of whether any integrated public utility system other than the Union Electric system designated in the Commission's findings and opinion should serve as petitioner's principal system. On April 29, 1942 such a petition was filed, and, on information and belief, such petition has not yet been acted on by the Commission.

10. At the hearings before the Trial Examiner, petitioner introduced sworn testimony and documentary evidence in support of the position taken by it with respect to the issues raised by the notice and order for hearing. In its briefs, requests for specific findings of fact and oral argument, petitioner specified the findings of fact and conclusions to which it believed it was entitled by the record and the constructions of the Act for which it contended. Petitioner has at all times reserved and refused to waive its constitutional and legal rights. The objections to the order of the Commission hereinafter set forth and the points hereinafter specified upon which petitioner intends to rely were all duly urged before the Commission.

11. The jurisdiction of this Court is invoked under Section 24 of the Act, which provides that any person aggrieved by an order issued by the Commission under the Act may obtain a review of such order in the Circuit Court of Appeals of the United States within any Circuit wherein such person has his principal place of business.

12. The order to be reviewed hereunder is invalid and void and should be set aside in its entirety for the reason that Section 11(b)(1), as interpreted by the Commission

in its findings and opinion dated April 14, 1942 and as applied in its order of said date, is unconstitutional for the reasons, among others, that it constitutes an improper delegation of legislative power, that it establishes unduly vague and indefinite standards, that it deprives petitioner and its security holders of their property without due process of law, that it exceeds the power of Congress to regulate interstate commerce and imposes arbitrary and unconstitutional restrictions upon such commerce and is not a valid exercise of any power conferred by the Constitution upon Congress.

13. The order to be reviewed hereunder is invalid and void and should be set aside in its entirety, for the reason that it was contrary to the provisions of the Act and to the intent and mandate of Congress for the Commission to proceed by notice and order pursuant to Section 11(b)(1) until the Commission had made its investigations and studies and made public its recommendations as to the type and size of geographically and economically integrated public utility systems which can best promote and harmonize the interests of the public, the investor and the consumer, which investigations, studies and recommendations the Commission is directed to make by Section 30 of the Act; and to institute and carry forward the proceeding and enter orders therein before the Commission had made such studies and published such recommendations deprived petitioner of property without due process of law in violation of the Fifth Amendment to the Constitution.

14. The order to be reviewed hereunder is invalid and void and should be set aside in so far as it directs petitioner to divest itself of its investments in Wisconsin Electric Power Company and its subsidiaries, Wisconsin Gas & Electric Company, Wisconsin Michigan Power Company,

Milwaukee Light, Heat & Traction Company and Hevi-Duty Electric Company (hereinafter collectively called the "Wisconsin Michigan Group"), The Cleveland Electric Illuminating Company and its subsidiaries, The Detroit Edison Company and its subsidiaries, Pacific Gas & Electric Company and its subsidiaries, West Kentucky Coal Company and its subsidiaries, and North American Utility Securities Corporation, for the reasons that

(a) The Commission erred in failing to find the facts requested by petitioner in its requested findings of fact numbered 3.5, 3.10, 3.11, 4.1 to 4.23, inclusive, and 6.1 to 6.38, inclusive.

(b) The Commission erred in finding, without substantial evidence and contrary to substantial evidence, that the electric utility systems of Union Electric Company of Missouri and its subsidiaries, the Wisconsin Michigan Group and The Cleveland Electric Illuminating Company are not located in adjoining states within the meaning of Section 11(b)(1).

(c) The Commission erred in failing to find, contrary to substantial evidence, that the continued combination of the electric utility systems of Union Electric Company of Missouri and its subsidiaries, the Wisconsin Michigan Group and The Cleveland Electric Illuminating Company, or any two thereof, under the control of petitioner is not so large (considering the state of the art and the area or region affected) as to impair the advantages of localized management, efficient operation or the effectiveness of regulation.

(d) The Commission erred in failing to find, contrary to substantial evidence, that each of the electric utility systems of Union Electric Company of Missouri and its subsidiaries, the Wisconsin Michigan Group and The Cleveland Electric Illuminating Company cannot be operated as an independent system without the loss

of substantial economies which can be secured by the retention of control by petitioner of such system.

(e) The Commission erred in failing to find, contrary to substantial evidence, that petitioner's investments in The Detroit Edison Company, Pacific Gas & Electric Company, West Kentucky Coal Company and North American Utility Securities Corporation, and each of them, are reasonably incidental or economically necessary or appropriate to the operations of its integrated public utility system.

(f) The Commission erred in finding, without substantial evidence and contrary to substantial evidence, that petitioner was required to designate in advance the single integrated public utility system retainable by it under Section 11(b)(1), and in failing to find that any one of the Union, Wisconsin-Michigan and Cleveland systems might be so retained as the principal system, with the other two as additional systems.

(g) The Commission erred in failing to find, contrary to substantial evidence, that under a proper construction of Section 11(b)(1), petitioner is entitled to retain in its holding company system the electric utility systems and other businesses of Union Electric Company of Missouri and its subsidiaries, the Wisconsin Michigan Group and The Cleveland Electric Illuminating Company and its subsidiaries, together with petitioner's investments in The Detroit Edison Company, Pacific Gas & Electric Company, West Kentucky Coal Company and North American Utility Securities Corporation.

15. Petitioner is aggrieved by said order because by reason thereof it is required to divest itself of its valuable investments in The Cleveland Electric Illuminating Company and its subsidiaries, the Wisconsin Michigan Group, The Detroit Edison Company and its subsidiaries, Pacific

Gas & Electric Company and its subsidiaries, West Kentucky Coal Company and its subsidiaries and North American Utility Securities Corporation. Since said order of the Commission, dated April 14, 1942, by its terms must be complied with within one year, unless extended by the Commission in its discretion, it is essential that the review of said order operate as a stay thereof.

16. No previous application for the relief sought in this petition has been made to any other court or judge.

WHEREFORE your petitioner respectfully prays that this Honorable Court review the order dated April 14, 1942, issued by the Commission against your petitioner and others, stay said order of the Commission during the pendency of such review, set said order aside in its entirety and grant such other and further relief as to the Court may seem just and equitable.

UNITED STATES OF AMERICA

BEFORE THE

SECURITIES AND EXCHANGE COMMISSION

At a regular session of the Securities and Exchange Commission, held at its office in the City of Philadelphia, Pa., on the 14th day of April, A. D., 1942.

IN THE MATTER *of* THE NORTH AMERICAN COMPANY *and* ITS SUBSIDIARY COMPANIES Respondents. File No. 59-10 Public Utility Holding Company Act of 1935—Section 11(b)(1)	Order Requiring Divestiture by Holding Companies and Subsidiaries in Holding Company System of Companies and Properties Owned or Operated Thereby.

The Commission having on March 8, 1940, by notice and order for hearing, supplemented by a notice and order dated August 12, 1940, adding certain companies as respondents, instituted proceedings under Section 11(b)(1) of the Public Utility Holding Company Act of 1935 against The North American Company and its subsidiaries to determine their status under said section, and The North American Company and its subsidiaries having severally answered such notice and order; and

Hearings having been held after due notice, requests for findings of fact on behalf of such companies and briefs in support thereof having been filed, oral argument having been heard; and

The Commission being advised in the premises, and having this day issued its Findings and Opinion with respect to certain action which the Commission finds necessary to limit the operations of the holding company systems of The North American Company and its subsidiaries, including each subsidiary thereof which is a registered holding company and its subsidiaries, to a single integrated public utility system and additional systems and other businesses in accordance with the requirements of Section 11(b)(1) of the Public Utility Holding Company Act of 1935;

IT IS ORDERED, pursuant to Section 11(b)(1):

1. That The North American Company, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

Union Electric Land and Development Company
East St. Louis & Suburban Railway Company
East St. Louis Railway Company
Wisconsin Electric Power Company
The Milwaukee Electric Railway & Transport Company
Motor Transport Company
Badger Auto Service Company
Wisconsin Gas & Electric Company
Wisconsin Michigan Power Company
Milwaukee Light, Heat & Traction Company
Hevi-Duty Electric Company
The Cleveland Electric Illuminating Company
The Power & Light Building Company
The Ceico Company
North American Light & Power Company
The Kansas Power and Light Company

Missouri Power & Light Company
The Blue River Power Company
The McPherson Oil & Gas Development Company
Power & Light Securities Company
North American Oil and Gas Company
Northern Natural Gas Company
Argus Natural Gas Company, Inc.
Peoples Natural Gas Company
Illinois Traction Company
Kewanee Public Service Company
Cahokia Manufacturers Gas Company
Western Illinois Ice Company
Illinois Iowa Power Company
Des Moines Electric Light Company
Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
Cairo City Gas Company
Champaign and Urbana Gas Light and Coke Company
Danville Gas Light Company
Decatur Electric Company
The Jacksonville Gas Light & Coke Company
Jacksonville Railway and Light Company
St. Louis Electric Terminal Railway Company
Venice Gas Company
Washington Railway and Electric Company
Potomac Electric Power Company
Great Falls Power Company
The Washington and Rockville Railway Company of Montgomery County
Braddock Light & Power Company, Incorporated
Capital Transit Company
Montgomery Bus Lines, Incorporated
The Glen Echo Park Company
West Kentucky Coal Company (New Jersey)
West Kentucky Coal Company (Delaware)
Peoples Coal Company
St. Bernard Coal Company

North American Utility Securities Corporation
Pacific Gas and Electric Company and its subsidiaries
The Detroit Edison Company and its subsidiaries;

2. That Union Electric Company of Missouri, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

Union Electric Land and Development Company
East St. Louis & Suburban Railway Company
East St. Louis Railway Company;

3. That Washington Railway and Electric Company, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing or causing the disposition in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

Great Falls Power Company
Capital Transit Company
Montgomery Bus Lines, Incorporated
The Glen Echo Park Company;

4. That Washington and Rockville Railway Company of Montgomery County, a registered public utility holding company, shall sever its relationship with the company named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect

ownership, control and holding of securities issued and properties owned, controlled or operated by:

Great Falls Power Company;

5. That Northern Natural Gas Company, a registered public utility holding company, shall sever its relationship with the company named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by:

Argus Natural Gas Company;

6. That Illinois Traction Company, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

Western Illinois Ice Company
Des Moines Electric Light Company
Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
St. Louis Electric Terminal Railway Company;

and that Illinois Traction Company shall cease to own facilities devoted to, or engage in or control, directly or indirectly, the operation of any water, ice, oil drilling and transportation business now conducted by Illinois Iowa Power Company;

That Illinois Iowa Power Company, a registered public utility holding company, shall sever its relationship with

the companies named hereafter by disposing, or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

Des Moines Electric Light Company
Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
St. Louis Electric Terminal Railway Company;

and that Illinois Iowa Power Company shall cease to own or operate any property or facilities now owned or operated by it for the purpose of conducting, directly or indirectly, any water, ice, oil drilling and transportation business now conducted by it, and to cease engaging, directly or indirectly, in any water, ice, oil drilling and transportation business now engaged in by it; and

It is Further Ordered that the respondents, in accordance with Section 11(e) of the said Act, shall comply with this order within one year from the date of its entry (without prejudice to their right to apply for additional time to comply with such order, as provided in such section).

Certain of the respondents in this proceeding which are registered public utility holding companies controlling or operating more than one single integrated public utility system, although heretofore afforded opportunity to indicate their choice of the single integrated system they desire to retain as their principal system, having failed to avail themselves of such opportunity, and the Commission desiring, nevertheless, that further opportunity be afforded such respondents to indicate their views with respect to the choice of a principal system;

It is Further Ordered that notwithstanding the provisions of Rule XII(d) of the Commission's Rules of Prac-

tice, The North American Company, Northern Natural Gas Company, Illinois Traction Company, and Illinois Iowa Power Company may, within 15 days of the date hereof, petition for leave to present further argument and proffer additional evidence as follows:

1. The North American Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system, other than the integrated electric utility system of the Union group as described in our Findings and Opinion herein this day issued, shall serve as its principal system;

2. Northern Natural Gas Company may petition for opportunity to present further argument or additional evidence on the question whether the single integrated gas utility system operated by Argus Natural Gas Company, rather than that operated by Peoples Natural Gas Company, shall serve as its principal system.

3. Illinois Traction Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system controlled or operated by any of its subsidiary companies, other than the major integrated electric utility system operated by Illinois Iowa Power Company, referred to in our Findings and Opinion herein this day issued, shall serve as its principal system.

4. Illinois Iowa Power Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system operated by it or any of its subsidiaries other than the major integrated electric utility system referred to in our Findings and Opinion herein this day issued, shall serve as its principal system.

Provided, however, that the Commission reserves the right to grant, deny or dispose of any such petition according to the merits of the grounds urged in support thereof.

Issue having arisen in this proceeding as to the permissibility of retention of (a) the gas businesses conducted by Union Electric Company of Illinois, Iowa Union Electric Company, and St. Louis County Gas Company, in addition to the integrated electric utility system operated by Union Electric Company of Missouri and its subsidiaries; (b) the gas businesses conducted by Illinois Iowa Power Company, Kewanee Public Service Company, and Cahokia Manufacturers Gas Company, in addition to the electric operations of Illinois Iowa Power Company and Kewanee Public Service Company; (c) the gas operations of Des Moines Electric Light Company and Iowa Power and Light Company, in addition to the electric operations of said companies; and (d) the securities of Cairo City Gas Company, Champaign and Urbana Gas Light and Coke Company, Danville Gas Light Company, Decatur Electric Company, The Jacksonville Gas Light & Coke Company, Jacksonville Railway and Light Company, and Venice Gas Company in the holding company systems of Illinois Traction Company and Illinois Iowa Power Company; and

The Commission deeming it necessary and appropriate that the record be reopened and that additional opportunity be afforded for the presentation of further relevant evidence bearing on such questions;

It is ordered that, at such hour and place, and before such trial examiner and in such manner as the Commission shall by further notice and order designate, additional opportunity shall be afforded for the presentation of further relevant evidence bearing upon the question whether the gas businesses and securities referred to may be retained under clauses (A), (B), and (C) of Section 11 (b)(1) of the Act as systems additional to the integrated electric utility systems of Union Electric Company of Missouri and its subsidiaries; Illinois Iowa Power Company and Kewanee Public Service Company; and Des Moines Electric Light Company and Iowa Power and Light Company, respectively.

Counsel for The North American Company having moved for a dismissal of this proceeding as to certain

of its subsidiaries, named in our Order of March 8, 1940, commencing this proceeding, on the ground that they have been dissolved, or that The North American Company no longer has any interest in them, no objection having been made to this motion, and the Commission being of the opinion that the motion should be granted;

IT IS FURTHER ORDERED that this proceeding be, and the same hereby is, dismissed as to the following named respondents:

Washington and Glen Echo Railroad Company
St. Louis and East St. Louis Electric Railway Company
Wired Radio, Inc.
Wired Rediffusion Developments, Ltd.
St. Charles Electric Light and Power Company
Lakeside Light and Power Company
Wisconsin General Railway Company
Bloomington and Normal Railway, Electric and Heating Company
Decatur Light, Heat and Power Company
Elkhart Electric Light Company
Chicago and Electric Valley Railroad Company.

IT IS PROVIDED, with respect to our Findings, Opinion and Order herein, in their entirety, and with respect to the entry, publication, and service thereof, that they shall be without prejudice to the right of the Commission to enter such other and further appropriate orders from time to time as the Commission may deem necessary to secure compliance by the respondents with the provisions of the Act and the pertinent rules and regulations thereunder in carrying out the provisions of this Order; and

IT IS FURTHER PROVIDED that jurisdiction is reserved to the Commission, notwithstanding this Order, or its entry, publication, and service, to conduct such investigations, hearings, or other proceedings involving any or all of the respondents herein and to make such orders as it shall deem

necessary or appropriate under Section 11 (b)(2) or any other provision of the Public Utility Holding Company Act of 1935.

By the Commission.

FRANCIS P. BRASSOR,
Secretary.

IN THE

United States Circuit Court of Appeals

FOR THE SECOND CIRCUIT.

THE NORTH AMERICAN COMPANY,
Petitioner,

against

SECURITIES AND EXCHANGE COMMISSION,
Respondent.

PETITION TO REVIEW ORDER OF SECURITIES AND EXCHANGE COMMISSION DATED JUNE 25, 1942

SULLIVAN & CROMWELL,
Attorneys for Petitioner,
48 Wall Street,
New York, N. Y.

IN THE

United States Circuit Court of Appeals

FOR THE SECOND CIRCUIT.

THE NORTH AMERICAN COMPANY,
Petitioner,

against

SECURITIES AND EXCHANGE COMMISSION,
Respondent.

PETITION.

To the Honorable the United States Circuit Court of Appeals for the Second Circuit:

The petition of The North American Company respectfully shows:

1. Petitioner is a corporation organized and existing under the laws of the State of New Jersey, engaged in the business of holding securities for investment, and having its principal place of business in the City of New York, in the Second Judicial Circuit of the United States.

2. The Securities and Exchange Commission (hereinafter called the "Commission") was established under Section 4, Title I, of the Securities Exchange Act of 1934 and is charged with the administration of the Public Utility Holding Company Act of 1935 (hereinafter called the "Act").

3. Petitioner seeks review of an order of the Commission dated June 25, 1942, entered in a proceeding initiated by a notice and order for hearing dated March 8, 1940, directed by the Commission against petitioner and various of its

subsidiaries under Section 11(b)(1) of the Act. A copy of the order of the Commission dated June 25, 1942 is annexed hereto.

4. Reference is made to the petition for review of this petitioner previously filed with this Court on June 12, 1942 seeking review of another order of the Commission dated April 14, 1942 in the same proceeding, which petition states the circumstances and facts leading up to the order of April 14, 1942. The said order of April 14, 1942 provided that within fifteen days from the date thereof petitioner could file with the Commission a petition for leave to present further argument and proffer additional evidence with respect to the question of whether any integrated public utility system other than the Union Electric system designated in the Commission's findings and opinion should serve as petitioner's principal system. On April 29, 1942 a petition was filed by the petitioner pursuant to the provision of the order of April 14, 1942, referred to above, with the Commission and was denied by the order of the Commission of June 25, 1942 of which review is hereby sought. No hearing was held, no evidence taken or argument had in connection with the entry of the said order of June 25, 1942.

5. The jurisdiction of this Court is invoked under Section 24 of the Act which provides that any person aggrieved by an order issued by the Commission under the Act may obtain a review of such order in the Circuit Court of Appeals of the United States within any Circuit wherein such person has its principal place of business.

6. The order to be reviewed hereunder is invalid and void and should be set aside in its entirety for the reason that Section 11(b)(1) of the Act does not empower the Commission to enter an order designating a particular single integrated public-utility system for the petitioner, or compelling an election by the petitioner of a particular single integrated public-utility system prior to the expiration of the period within which the Commission's order of April 14,

1942 must be complied with; and for the further reason that if Section 11(b)(1) of the Act is construed to authorize such an order by the Commission it is unconstitutional for the reasons, among others, that it constitutes an improper delegation of legislative power, that it deprives petitioner and its securityholders of their property without due process of law, that it exceeds the power of Congress to regulate interstate commerce and imposes arbitrary and unconstitutional restrictions upon such commerce and is not a valid exercise of any power conferred by the Constitution upon Congress.

7. Petitioner is aggrieved by said order, herein sought to be reviewed, because by reason thereof, disregarding the invalidity of the order of April 14, 1942, it is deprived of its right to select, prior to the expiration of the period within which the Commission's order of April 14, 1942 must be complied with, the single integrated public-utility system which it chooses to retain and is compelled to accept as its principal system that system designated by the Commission in its order of April 14, 1942.

8. No previous application for the relief sought in this petition has been made to any other court or judge.

WHEREFORE, your petitioner respectfully prays that this Honorable Court review the order dated June 25, 1942, issued by the Commission against your petitioner, set said order aside in its entirety and grant such other and further relief as to the Court may seem just and equitable.

UNITED STATES OF AMERICA

BEFORE THE

SECURITIES AND EXCHANGE COMMISSION

At a regular session of the Securities and Exchange Commission, held at its office in the City of Philadelphia, Pa., on the 25th day of June, A. D., 1942.

IN THE MATTER *of* THE NORTH AMERICAN COMPANY **and** ITS SUBSIDIARY COMPANIES Respondents File No. 59-10 Public Utility Holding Company Act of 1935—Section 11(b)(1)	Order Disposing of Petitions for Rehearing and Reargument

The Commission having on April 14, 1942, adopted its findings, opinion and order in proceedings pending pursuant to Section 11(b)(1) of the Public Utility Holding Company Act of 1935 in the matter of The North American Company and Its Subsidiary Companies, Respondents, which, among other things, designated the respective single or principal integrated public utility systems of the several holding companies in the holding company system of The North American Company; and

The said order having afforded an opportunity, notwithstanding the provisions of Rule XII(d) of the Commission's Rules of Practice, to The North American Company to request within fifteen days further argument or the presentation of additional evidence on the question whether any single integrated public utility system other than the integrated electric utility system of the Union group, denoting thereby the electric utility properties of Union Electric Company of Missouri and its subsidiaries, shall serve as the

"principal" system of The North American Company; and having, notwithstanding the said Rule of Practice, afforded to Illinois Iowa Power Company the opportunity to request within fifteen days further argument or the presentation of additional evidence on the question whether any single integrated public utility system operated by it or any of its subsidiaries, other than the major integrated electric utility system referred to in the said findings and opinion, shall serve as its principal system; and having, notwithstanding the said Rule of Practice, afforded to Northern Natural Gas Company the opportunity to request within fifteen days further argument or the presentation of additional evidence on the question whether the integrated public utility system of Argus Natural Gas Company, Inc., rather than that operated by Peoples Natural Gas Company, shall serve as its principal system; and

The North American Company and Illinois Iowa Power Company, having on April 28, 1942, petitioned for leave to present further argument and additional evidence upon certain matters; Northern Natural Gas Company, having on May 8, 1942, petitioned for leave to reopen the proceedings with respect to it and its subsidiaries, which petition was amended on May 27, 1942; the Commission having considered the petitions and being fully advised in the premises, and having this day issued its opinion with respect to the issues raised by said petitions;

IT IS ORDERED, for the reasons set forth in the said opinion, that the said petitions be, and the same hereby are, denied, except insofar as hereinafter set forth:

The petition of Illinois Iowa Power Company having indicated the existence of evidence respecting the retainability of certain oil drilling facilities owned by the company, which evidence was not before the Commission in the course of the original proceedings herein, and the Commission in its discretion deeming it advisable to afford to Illinois Iowa Power Company an opportunity to present such evidence for inclusion in the record herein; and

The petition of Northern Natural Gas Company having indicated the existence of evidence respecting the retainability of certain pipe line facilities owned by its subsidiary, Argus Natural Gas Company, Inc., which evidence was not before the Commission in the course of the original proceedings herein, and the Commission in its discretion deeming

it advisable to afford to Northern Natural Gas Company an opportunity to present such further evidence for inclusion in the record herein;

IT IS FURTHER ORDERED that the record be reopened and a hearing convened at a date to be set by further order of the Commission for the limited purpose of receiving such evidence as Illinois Iowa Power Company and Northern Natural Gas Company may proffer with respect to the retention and operation of said oil and pipe line facilities, respectively, and the evidence to be introduced shall be limited to those issues, as more fully set forth in the said opinion.

By the Commission.

ORVAL L. DUBOIS,
Secretary.

UNITED STATES OF AMERICA

BEFORE THE

Securities and Exchange Commission

AT A REGULAR SESSION OF THE SECURITIES AND EXCHANGE COMMISSION, HELD AT ITS OFFICES IN THE CITY OF WASHINGTON, D. C., ON THE 8TH DAY OF MARCH, A. D., 1940.

File Number 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY

and its

SUBSIDIARY COMPANIES

Respondents

NOTICE OF AND ORDER FOR HEARING PURSUANT TO SECTION 11 (b) (1) OF THE PUBLIC UTILITY HOLDING COMPANY ACT OF 1935

The Commission having examined, pursuant to Sections 11 (a), 18 (a) and 18 (b) of the Public Utility Holding Company Act of 1935, the corporate structure of The North American Company, a registered holding company, and its subsidiary companies, the relationship among the companies in the holding company system of said The North American Company, the character of the interests thereof and the properties owned or controlled thereby, and it appearing to the Commission from such examination that:

4 *Notice of and Order for Hearing*

I.

1. The North American Company, a registered holding company, is a corporation organized under the laws of New Jersey. It maintains its principal offices for the doing of business in the City of New York, State of New York. The following are subsidiary companies of The North American Company and are also registered holding companies within the meaning of the Public Utility Holding Company Act of 1935 (hereinafter sometimes referred to as the Act).

5

Name	*State of Organization*
Washington Railway and Electric Company	Act of Congress
The Washington and Rockville Railway Company of Montgomery County	Maryland
North American Light & Power Company	Delaware
Illinois Traction Company	Maine
Illinois Iowa Power Company	Illinois
Union Electric Company of Missouri	Missouri
Des Moines Electric Light Company	Maine
Northern Natural Gas Company	Delaware

2. The following are subsidiary companies of The North American Company or of The North American Company and one or more of the companies named in paragraph 1 above and are public utility companies within the meaning of the Act:

6

Name	*State of Organization*	*Nature of Business*
Union Electric Company of Missouri	Missouri	Electric Heating Holding Company
Union Electric Company of Illinois	Illinois	Electric, Gas
Mississippi River Power Company	Maine	Electric
Iowa Union Electric Company	Illinois	Electric, Gas

Name	*State of Organization*	*Nature of Business*
Cupples Station Light, Heat & Power Company	Missouri	Electric, Heating
St. Charles Electric Light & Power Company	Missouri	Electric
Lakeside Light and Power Company	Missouri	Electric
Wisconsin Electric Power Company	Wisconsin	Electric, Heating
Wisconsin Gas & Electric Company	Wisconsin	Electric, Gas, Heating, Transportation
Wisconsin Michigan Power Company	Wisconsin	Electric, Gas, Transportation 8
The Cleveland Electric Illuminating Company	Ohio	Electric, Heating
Potomac Electric Power Company	D. C.	Electric
Braddock Light & Power Company, Incorporated	Virginia	Electric
The Kansas Power and Light Company	Kansas	Electric, Gas, Heating, Ice, Water, Transportation
Missouri Power & Light Company	Missouri	Electric, Gas, Heating, Ice, Water
The Blue River Power Company	Delaware	Electric 9
Nebraska Natural Gas Company	Nebraska	Gas
Kewanee Public Service Company	Illinois	Electric, Gas
Illinois Iowa Power Company	Illinois	Electric, Gas, Heating, Water, Ice, Transportation and Holding Co.
Des Moines Electric Light Company	Maine	Electric, Gas, Heating, Holding Co.
Iowa Power and Light Company	Iowa	Electric, Gas
The St. Louis County Gas Company	Missouri	Gas
Peoples Natural Gas Company	Delaware	Gas
Argus Natural Gas Company, Inc.	Kansas	Gas

10 *Notice of and Order for Hearing*

3. The following are subsidiary companies of The North American Company or of The North American Company and one or more of the companies named in paragraph 1 above, and are not public utility companies within the meaning of the Act, but are engaged in the businesses respectively set forth opposite their names.

	Name	*State of Organization*	*Nature of Business*
11	Union Electric Land and Development Company	Missouri	Land
	St. Louis & Belleville Electric Rwy. Company	Illinois	Transportation
	St. Louis & Alton Railway Company	Illinois	Transportation
	Wisconsin General Railway Company	Wisconsin	Land
	The Milwaukee Electric Railway & Transport Company	Wisconsin	Transportation
	Motor Transport Company	Wisconsin	Transportation
	Badger Auto Service Company	Wisconsin	Auto Service
	Milwaukee Light, Heat & Traction Co.	Wisconsin	Land
12	Hevi-Duty Electric Company	Wisconsin	Furnace Construction
	The Power & Light Building Company	Ohio	Real Estate
	The Ceico Company	Ohio	Metering, Land
	Great Falls Power Company	Virginia	Land
	Capital Transit Company	D. C.	Transportation
	Northern Natural Gas Company	Delaware	Gas Pipe Line
	Montgomery Bus Lines, Incorporated	Maryland	Transportation
	The Glen Echo Park Company	Maryland	Amusement
	The McPherson Oil & Gas Development Company	Kansas	Gas Production
	Power & Light Securities Company	Delaware	Investments

Name	*State of Organization*	*Nature of Business*
Cahokia Manufacturers Gas Company	Illinois	Gas, wholesale
Western Illinois Ice Company	Illinois	Ice
Illinois Terminal Railroad Company	Illinois	Railroad
Central Terminal Company	Missouri	Warehousing
West Kentucky Coal Company	New Jersey	Coal Mining
West Kentucky Coal Company	Delaware	Coal Sales
Peoples Coal Company	Nebraska	Coal Sales
St. Bernard Coal Company	New Jersey	Coal Sales
60 Broadway Building Corporation	New York	Real Estate
North American Utilities Securities Corporation	Maryland	Investments
Wired Radio Inc.	Delaware	Radio development
Wired Rediffusion Developments, Ltd.	England	Radio development

4. The following is a subsidiary company in the holding company system of The North American Company and sells goods to associate companies. It is engaged in the business set forth opposite its name:

Name	*State of Organization*	*Nature of Business*
Union Colliery Company	Missouri	Coal

5. The following are subsidiary companies of The North American Company and of one or more of the companies named in paragraphs 1, 2, and 3 above, and are inactive or in the process of dissolution:

Name	*State of Organization*
East St. Louis & Suburban Railway Company	Illinois
East St. Louis Railway Company	Illinois

Name	*State of Organization*
St. Louis and East St. Louis Electric Railway Company	Delaware
The Washington and Glen Echo Railroad Company	Maryland
North American Oil and Gas Company	Delaware
Bloomington & Normal Railway, Electric & Heating Co	Illinois
The Brighton Electric Light and Power Company	Illinois
Cairo City Gas Company	Illinois
17 Champaign and Urbana Gas Light and Coke Company	Illinois
Chicago and Illinois Valley Railroad Company	Illinois
Danville Gas Light Company	Illinois
Decatur Electric Company	Illinois
The Decatur Light, Heat and Power Company	Illinois
Elkhart Electric Light Co.	Illinois
The Jacksonville Gas Light & Coke Company	Illinois
Jacksonville Railway and Light Company	Maine
St. Louis Electric Terminal Railway Company	Missouri
Venice Gas Company	Illinois

18 6. Ten per centum (10%) or more of the outstanding voting securities of the following companies are directly or indirectly owned, controlled, and held with power to vote by The North American Company (or by a company that is a subsidiary company of said holding company); such companies, however, have filed applications for exemption under Section 2(a)(8) of the Act, and such applications are pending and undetermined:

Name	*State of Organization*	*Nature of Business*
The Detroit Edison Company	New York	Electric
Pacific Gas and Electric Company	California	Electric
Fox River Navigation Company	Wisconsin	Transportation

The following are active subsidiary companies of one or more of the companies named above in this paragraph:

Name	*State of Organization*
Huron Farms Company	Michigan
The Edison Illuminating Company of Detroit	Michigan
The Wayne Mining Company	Michigan
Valley Electric Supply Company	California
Arlington Properties Company, Ltd.	California
Western Canal Company	California
Vallejo Electric Light and Power Company	California

The following are inactive subsidiary companies of one or more of the companies named above in this paragraph:

Name	*State of Organization*
Essex County Light and Power Company, Limited	Canada
The Peninsular Electric Light Company	Michigan
St. Clair Edison Company	Michigan
The Washtenaw Light and Power Company	Michigan
San Joaquin Light and Power Corporation	California
Midland Counties Public Service Corporation	California
Standard Pacific Gas Line, Incorporated	Delaware

7. As of December 31, 1938 the holding company system of The North American Company served with electricity, communities having an aggregate population of 6,202,000 located in the States of:

Illinois	Iowa	Kansas
Michigan	Missouri	Maryland
Ohio	Virginia	Wisconsin

and in the District of Columbia. The electric service areas of said holding company system are shown on the annexed

map marked Exhibit "1" which is made a part hereof as if set out herein in full.

As of December 31, 1938 said holding company system served with gas communities having an aggregate population of 1,332,000 located in the States of

Iowa	Illinois	Kansas
Missouri	Nebraska	Wisconsin
Minnesota		

The gas service areas of said holding company system are
23 shown on the annexed map marked Exhibit "2" and made a part hereof as if set out herein in full.

Said holding company system, through the medium of its various subsidiaries is also engaged in various other businesses as set forth elsewhere herein.

The location of the operations of the public utility subsidiary companies named in paragraph 2 of Section 1 above and the respective mileage distances from the principal offices for the doing of business of The North American Company are shown on the annexed chart, marked Exhibit "3" which is made a part hereof as if set out herein in full.
24

II

8. Union Electric Company of Missouri, referred to in paragraph 2 above, a subsidiary of The North American Company, owns and operates in the State of Missouri, facilities used for the generation, transmission and distribution of electric energy for sale and is an electric utility company as defined in the Act. It also owns and operates in said state, facilities used for the production of steam and for its distribution for heating purposes. Union Electric Company

of Missouri is a public utility holding company within the meaning of the Act, and is registered as such.

9. Union Electric Company of Illinois, referred to in paragraph 2 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the State of Illinois facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in said State facilities used for the production and distribution of manufactured gas for sale at retail and is a gas utility company as defined in the Act.

10. Mississippi River Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the States of Illinois and Iowa, facilities used for the generation and transmission of electric energy for sale and is an electric utility company as defined in the Act.

11. Iowa Union Electric Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the States of Illinois and Iowa, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates, in the State of Iowa, facilities used for the production and distribution of manufactured gas for sale at retail, and is a gas utility company as defined in the Act.

12. Cupples Station Light, Heat and Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the State of Missouri, facilities used for the generation and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in said State facilities used for the supplying of steam heating service.

13. St. Charles Electric Light and Power Company, re-
29 ferred to in paragraph 2 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the State of Missouri, facilities used for the distribution of electric energy for sale, and is an electric utility company as defined in the Act.

14. Lakeside Light and Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the State of Missouri, facilities used for the ditsribution of electric energy for sale, and is an electric
30 utility company as defined in the Act.

15. Wisconsin Electric Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company, owns and operates in the State of Wisconsin, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates facilities in said State used for the production of steam and for its distribution for heating purposes.

16. Wisconsin Gas & Electric Company, referred to in paragraph 2 above, a subsidiary of The North American

Company, owns and operates in the State of Wisconsin, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in said state, facilities used for the production, transmission and distribution of manufactured gas for sale at retail, and is a gas utility company as defined in the Act. Said company also owns and operates in said State facilities used for the production of steam and for its distribution for heating purposes, and facilities used for supplying the transportation service.

17. Wisconsin Michigan Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company, owns and operates in the States of Wisconsin and Michigan facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in the State of Wisconsin facilities used for the production and distribution of manufactured gas for sale at retail, and is a gas utility company as defined in the Act. Said Company also owns and operates in said State facilities used for providing transportation service.

18. The Cleveland and Electric Illuminating Company, referred to in paragraph 2 above, a subsidiary of The North American Company, owns and operates in the State of Ohio, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in said State faciliities used for the production of steam and for its distribution for heating purposes.

19. Potomac Electric Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of Washington Railway and Electric Company, owns and operates in the District of Columbia and in the State of Maryland, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act.

20. Braddock Light & Power Company, Incorporated, referred to in paragraph 2 above, a subsidiary of The North American Company and of Washington Railway and Electric Company and of The Washington and Rockville Railway Company of Montgomery County, owns and operates in the Commonwealth of Virginia, facilities used for the distribution of electric energy for sale and is an electric utility company as defined in the Act.

21. The Kansas Power and Light Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company, owns and operates in the State of Kansas, facilities used for the generation, transmission and distribution of electric energy for sale and is an electric utility company as defined in the Act. It also owns and operates in said State facilities used for the transmission and distribution of natural gas for sale at retail and is a gas utility company as defined in the Act. Said company also owns and operates in said State facilities used for providing steam heat, water, ice and transportation service.

22. Missouri Power & Light Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company,

owns and operates in the State of Missouri, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in said State facilities used for the transmission and distribution of natural gas for sale at retail, and is a gas utility company as defined in the Act. Said Company also owns and operates in said State facilities used for providing heat, water and ice and transportation service.

23. The Blue River Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company, owns and operates in the State of Kansas, facilities used for the generation of electric energy for sale, and is an electric utility company as defined in the Act.

24. Nebraska Natural Gas Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company, owns and operates in the State of Nebraska, facilities used for the transmission and distribution of natural gas for sale at retail, and is a gas utility company as defined in the Act.

25. Kewanee Public Service Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company and of Illinois Traction Company, owns and operates in the State of Illinois, facilities used for the generation, transmission and distribution of electric energy for sale and is an electric utility company as defined in the Act. It also owns and operates in said State, facilities used for the production and distribution of manufactured gas for sale at retail and is a gas utility company as defined in the Act.

40

26. Illinois Iowa Power Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company and of Illinois Traction Company, owns and operates in the State of Illinois, facilities used for the generation, transmission and distribution of electric energy for sale and is an electric utility company as defined in the Act. It also owns and operates in said State facilities used for the production and distribution of manufactured gas for sale at retail and is a gas utility company as defined in the Act. Said Company
41 also owns and operates in said State facilities used for providing heating, water, ice and transportation service. Said Company is a public utility holding company within the meaning of the Act, and is registered as such.

27. Des Moines Electric Light Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company and of Illinois Traction Company and of Illinois Iowa Power Company, owns and operates in the State of Iowa, facilities used for the generation, transmission and distribution of
42 electric energy for sale, and is an electric utility company as defined in the Act. It also owns and operates in said State facilities used for the production and distribution of manufactured gas for sale at retail, and is a gas utility company as defined in the Act. Said Company also owns and operates in said State facilities used for the production of steam and for its distribution for heating purposes. Said Company is a public utility holding company within the meaning of the Act.

28. Iowa Power and Light Company, referred to in paragraph 2 above, a subsidiary of The North American Com-

pany and of North American Light & Power Company and of Illinois Traction Company and of Illinois Iowa Power Company and of Des Moines Electric Light Company owns and operates in the State of Iowa, facilities used for the generation, transmission and distribution of electric energy for sale, and is an electric utility company as defined in the Act. Said Company also owns and operates in said State, facilities used for the production and distribution of manufactured gas and distribution of natural gas for sale at retail and is a gas utility company as defined in the Act.

29. The St. Louis County Gas Company, referred to in paragraph 2 above, a subsidiary of The North American Company, owns and operates in the State of Missouri, facilities used for the production and distribution of manufactured gas and for the distribution of mixed gas for sale at retail and is a gas utility company as defined in the Act.

30. Peoples Natural Gas Company, referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company and of Northern Natural Gas Company, owns and operates in the States of Nebraska, Iowa and Minnesota, facilities used for the transmission and distribution of natural gas for sale at retail and is a gas utility company as defined in the Act.

31. Argus Natural Gas Company, Inc., referred to in paragraph 2 above, a subsidiary of The North American Company and of North American Light & Power Company and of Northern Natural Gas Company, owns and operates in the State of Kansas, facilities used for the transmission and distribution of natural gas for sale at retail, and is a gas utility company as defined in the Act.

III

32. Northern Natural Gas Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of North American Light & Power Company owns and operates in the States of Texas, Oklahoma, Kansas, Nebraska, Iowa, Minnesota, and South Dakota, facilities used for the production and transmission of natural gas. It is a public utility holding company within the meaning of the Act, and is registered as such.

33. Union Electric Land and Development Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, own real estate in the State of Missouri.

34. St. Louis and Bellevilie Electric Railway Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of Union Electric Company of Missouri, owns and operates in the State of Illinois, facilities used for providing freight transportation service.

Cahokia Manufacturers Gas Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of North American Light & Power Company and of Illinois Traction Company, owns and operates in the State of Illinois, facilities used for the production of manufactured gas for sale at wholesale.

51. Western Illinois Ice Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of North American Light & Power Company and of Illinois Traction Company, owns and operates in the State of Illinois facilities used for the manufacture and distribution of ice.

52. Illinois Terminal Railroad Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of North American Light & Power Company and of Illinois Traction Company, and of Illinois Iowa Power Company, owns, leases and operates in the States of Missouri and Illinois facilities used for providing freight transportation service.

53. Central Terminal Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of North American Light & Power Company, and of Illinois

Traction Company, and of Illinois Iowa Power Company, owns and operates warehouses in the State of Missouri.

54. West Kentucky Coal Company (New Jersey), referred to in paragraph 3 above, a subsidiary of The North American Company, owns and operates coal mining properties and mineral rights in the State of Kentucky.

55. West Kentucky Coal Company (Delaware), referred to in paragraph 3 above, a subsidiary of The North American Company and of West Kentucky Coal Company (New Jersey) is a coal sales company.

56. Peoples Coal Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of West Kentucky Coal Company (New Jersey) and of West Kentucky Coal Company (Delaware) is a coal sales company.

57. St. Bernard Coal Company, referred to in paragraph 3 above, a subsidiary of The North American Company and of West Kentucky Coal Company (New Jersey) is a coal sales company.

58. 60 Broadway Building Corporation, referred to in paragraph 3 above, a subsidiary of The North American Company, owns and operates real estate in the City of New York, State of New York.

59. North American Utilities Securities Corporation, referred to in paragraph 3 above, a subsidiary of The North American Company, is an investment company with its principal offices in the City of New York, State of New York.

60. Wired Radio, Inc., referred to in paragraph 3 above, a subsidiary of The North American Company, is engaged in experimenting in and developing the art of generating and distributing high frequency current over electric light and power wires with particular attention to the transmission by this means of musical and other programs. 61

61. Wired Rediffusion Developments, Ltd., referred to in paragraph 3 above, a subsidiary of The North American Company and of Wired Radio, Inc., is engaged in experimenting in and developing the art of generating and distributing high frequency current over electric light and power wires with particular attention to the transmission by this means of musical and other programs. 62

IV

62. Union Colliery Company, referred to in paragraph 4 above, a subsidiary of The North American Company and of Union Electric Company of Missouri and of Union Electric Company of Illinois produces coal and sells to associated companies. 63

V

And it appearing further to the Commission from such examination that:

63. The holding company system of The North American Company is not confined in its operations to those of a single integrated public utility system within the meaning of the Act, and to such other businesses as are reasonably incidental, economically necessary or appropriate to the operations of such integrated public utility system.

64 *Notice of and Order for Hearing*

VI

WHEREFORE IT IS ORDERED that the said The North American Company and each of its subsidiary companies hereinbefore named, all of which are made respondents herein, file with the Secretary of the Commission on or before the 18th day of April, 1940, their joint or several answers admitting, denying, or otherwise explaining their respective positions as to each of the allegations of Parts I to V hereof inclusive. Any such answer may include a statement of the
65 claim of the respondents or any of them as to (a) the action, if any, which is necessary and should be required to be taken by any of the respondents (including the divestment of control, securities or other assets), to limit the operations of each of the registered holding companies hereinbefore named to a single integrated public-utility system and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system; (b) the extent to which any of said respondents which is a registered holding company should be permitted to continue to control one or more additional in-
66 tegrated public-utility systems as may meet the requirements of Clauses (A), (B) and (C) of Section 11(b)(1) of the Act; and (c) the extent to which any of said respondents should be permitted to retain an interest in any business (other than the business of a public-utility company as such), as provided by Section 11(b)(1) of the Act. The answer of any respondent which is a registered holding company may, if such respondent so desires, state that such respondent proposes and is prepared to take such action as will cause it to cease to be a holding company within the meaning of the Act, together with a description of such action and the time within which it proposes to take such action; and

IT IS FURTHER ORDERED pursuant to Section 11(b)(1) of the said Public Utility Holding Company Act of 1935 that a hearing be held at the offices of the Securities and Exchange Commission, 1778 Pennsylvania Avenue, N. W., Washington, D. C., at 10 A. M. on the twentieth day after the date herein fixed for the filing of answers (or such later date as the Commission may prior thereto fix by supplementary notice), to determine (1) such issues, if any, as may arise from the allegations of Parts I to V hereof, inclusive, and the answer or answers filed thereto by the respondents herein or any of them as hereinbefore provided, and by any other party or parties hereto as hereinafter provided; (2) what action, if any, is necessary and shall be required to be taken by the respondents herein, or any of them, to limit the operations of the holding company systems of each of the registered holding companies hereinbefore named to a single integrated public-utility system, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system; (3) pursuant to such application as may be made herein, the extent to which each of the registered holding companies hereinbefore named shall be permitted to continue to control one or more additional integrated public-utility systems as provided by Section 11(b)(1) of the Act; and (4) pursuant to such application as may be made herein, the extent to which any of the respondents will be permitted to retain any interest in any business (other than that of a public-utility company as such) as provided by Section 11(b)(1) of the Act; and

68

69

IT IS FURTHER ORDERED that the Secretary of the Commission shall serve notice of the hearing aforesaid by mailing a copy of this order by registered mail to said The North

American Company and to each of its subsidiary companies aforementioned, respondents herein, such mailing to be made not less than thirty days prior to the date hereinbefore fixed for the filing of answers; and that notice is hereby given of said hearing to the said respondents and to all other persons, including the security holders and consumers of the said respondents, all States, municipalities and political subdivisions of States within which are located any of the aforesaid utility assets or under the laws of which any of the respondents are incorporated, all State commissions, State securities commissions and all agencies, authorities or instrumentalities of one or more States, municipalities or other political subdivisions having jurisdiction over any of the respondents or over any of the businesses, affairs or operations of any of them, and that such notice shall be given further by general release of the Commission, distributed to the press and mailed to the mailing list for releases issued under the Public Utility Holding Company Act of 1935. Further notice shall be given to all persons by publication in the Federal Register, not later than thirty days prior to the date hereinbefore fixed for the filing of answers, of a notice as follows:

NOTICE OF HEARING UNDER SECTION 11 (b) (1) OF THE PUBLIC UTILITY HOLDINGS COMPANY ACT OF 1935 WITH RESPECT TO THE HOLDING-COMPANY SYSTEM OF THE NORTH AMERICAN COMPANY.

Notice is hereby given that the Securities and Exchange Commission adopted an order on the 8th day of March, 1940, directing that a hearing pursuant to Section 11 (b) (1) of the Public Utility Holding Company Act of 1935 be held with respect of The North American Com-

pany and each of its subsidiary companies hereinafter called the respondents at the offices of the said Securities and Exchange Commission, 1778 Pennsylvania Avenue, N. W., Washington, D. C., at 10 A. M. on the twentieth day after the date herein fixed for the filing of answers (or such later date as the Commission may prior thereto fix by supplementary notice).

Said order recites that it appears to the Commission that the holding company system of the said The North American Company is not confined in its operations to those of a single integrated public-utility system within 74 the meaning of the said Act, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system.

Said order provides that each respondent shall file its answer to the allegations of said order on or before the 18th day of April, 1940, and thereby shall admit, deny, or otherwise explain the position of such respondent with respect to the allegations set forth in Parts I to V of said notice and order for hearing, and also provides that such answer may include a statement of the claim of the re- 75 spondents or any of them as to (a) the action, if any, which is necessary and should be required to be taken by any of the respondents (including the divestment of control, securities or other assets), to limit the operations of each of the respondents as may be a registered holding company to a single integrated public-utility system and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system; (b) the extent to which any of said respondents which is a registered holding company should be permitted to continue to control

76 one or more additional integrated public-utility systems as may meet the requirements of Clauses (A), (B) and (C) of Section 11 (b) (1) of the Act; and (c) the extent to which any of said respondents should be permitted to retain an interest in any business (other than the business of a public-utility company as such) as provided by Section 11 (b) (1) of the Act. The answer of any respondent which is a registered holding company may, if such respondent so desires, state that such respondent proposes and is prepared to take such action as will cause it to
77 cease to be a holding company within the meaning of the Act, together with a description of such action and the time within which it proposes to take such action; and

Said order further provides that the purpose of such hearing is to determine (1) such issues, if any, as may arise from the allegations of Parts I to V, inclusive, of said order, and the answer or answers filed thereto by the respondents or any of them as hereinbefore provided, and by any other party or parties hereto as hereinafter provided; (2) what action, if any, is necessary and shall
78 be required to be taken by the respondents in said proceeding, or any of them, to limit the operations of the holding company systems of each of the respondents as may be a registered holding company to a single integrated public-utility system, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system; (3) pursuant to such application as may be made in said proceedings, the extent to which each of the respondents as may be a registered holding company shall be permitted to continue to control one or more additional integrated public-utility systems as provided by Section 11 (b) (1) of the Act; and (4) pursuant

to such application as may be made in said proceedings, the extent to which any of the respondents will be permitted to retain any interest in any business (other than that of a public-utility company as such) as provided by Section 11 (b) (1) of the Act; and

Reference is made to said notice and order for hearing for a more complete statement of the various matters to be determined at said hearing, and a copy of said notice and order for hearing is on file and open to public inspection at the offices of said Securities and Exchange Commission 80 in Washington, D. C., and in each of the Regional Offices of said Securities and Exchange Commission, and a Copy of said notice and order for hearing may be had upon written request to the Secretary of said Commission, and said notice and order for hearing is hereby made a part of this notice as if more fully herein set forth at length.

Notice of the aforesaid hearing is particularly given to each of the aforesaid respondents, The North American Company, Washington Railway and Electric Company, The Washington and Rockville Railway Company of Montgomery County, North American Light & Power 81 Company, Illinois Traction Company, Illinois Iowa Power Company, Union Electric Company of Missouri, Des Moines Electric Light Company, Northern Natural Gas Company, Union Electric Company of Illinois, Mississippi River Power Company, Iowa Union Electric Company, Cupples Station Light Heat & Power Company, St. Charles Electric Light & Power Company, Lakeside Light and Power Company, Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, Wisconsin Michigan Power Company, The Cleveland Electric Illuminating Company, Potomac Electric Power

Company, Braddock Light & Power Company, Incorporated, The Kansas Power and Light Company, Missouri Power & Light Company, The Blue River Power Company, Nebraska Natural Gas Company, Kewanee Public Service Company, Iowa Power and Light Company, The St. Louis County Gas Company, Union Electric Land & Development Company, St. Louis & Belleville Electric Rwy. Company, St. Louis & Alton Railway Company, Wisconsin General Railway Company, The Milwaukee Electric Railway & Transport Company, Motor Transport Company, Badger Auto Service Company, Milwaukee Light, Heat & Traction Co., Hevi-Duty Electric Company, The Power & Light Building Company, The Ceico Company, Greaf Falls Power Company, Capital Transit Company, Montgomery Bus Lines, Incorporated, The Glen Echo Park Company, The McPherson Oil & Gas Development Company, Power & Light Securities Company, Cahokia Manufacturers Gas Company, Western Illinois Ice Company, Illinois Terminal Railroad Company, Central Terminal Company, West Kentucky Coal Company (New Jersey), West Kentucky Coal Company (Delaware), Peoples Coal Company, St. Bernard Coal Company, 60 Broadway Building Corporation, North American Utilities Securities Corporation, Wired Radio, Inc., Wired Rediffusion Developments, Ltd., Union Colliery Company, East St. Louis & Suburban Railway Company, East St. Louis Railway Company, St. Louis and East St. Louis Electric Railway Company, The Washington and Glen Echo Railroad Company, North American Oil and Gas Company, Bloomington & Normal Railway, Electric & Heating Co., The Brighton Electric Light and Power Company, Cairo City Gas Com-

pany, Champaign and Urbana Gas Light and Coke Company, Chicago and Illinois Valley Railroad Company, Danville Gas Light Company, Decatur Electric Company, The Decatur Light, Heat and Power Company, Elkhart Electric Light Co., The Jacksonville Gas Light & Coke Company, Jacksonville Railway and Light Company, St. Louis Electric Terminal Railway Company, Venice Gas Company, The Detroit Edison Company, Pacific Gas and Electric Company, Fox River Navigation Company, Huron Farms Company, The Edison Illuminating Company of Detroit, The Wayne Mining Company, Valley Electric Supply Company, Arlington Properties Company, Ltd., Western Canal Company, Vallejo Electric Light and Power Company, Essex County Light and Power Company, Limited, The Peninsular Electric Light Company, St. Clair Edison Company, The Washtenaw Light and Power Company, San Joaquin Light and Power Corporation, Midland Counties Public Service Corporation, Standard Pacific Gas Line, Incorporated, Argus Natural Gas Company, Inc., Peoples Natural Gas Co., and to all other persons, including the security holders and consumers of the said respondents, all States, municipalities, and political subdivisions of States within which are located any of the utility assets owned or operated by any of said respondents or under the laws of which any of the respondents are incorporated, all State Commissions, State securities commissions and all agencies, authorities or instrumentalities of one or more States, municipalities or other political subdivisions having jurisdiction over any of the respondents or over any of the buinesses, affairs or operations of any of them.

Said order further provides that any person proposing to intervene in said proceedings shall file with the Secre-

tary of the Securities and Exchange Commission on or before the 18th day of April, 1940, his request or application therefor as provided by Rule XVII of the Rules of Practice of the said Securities and Exchange Commission, and may, together with such request or application, file a proposed answer in form and content as hereinbefore provided, and which answer shall be deemed effectively filed upon the entry of an order by the Commission granting such request or application.

89 By order of the Securities and Exchange Commission this 8th day of March, 1940

Francis P. Brassor,
Secretary.

(SEAL)

It is further ordered that any person proposing to intervene in these proceedings shall file with the Secretary of the Commission on or before the 18th day of April, 1940, his request or application therefor as provided by Rule XVII of the Rules of Practice, and may, together with such re-
90 quest or application, file a proposed answer in form and content as hereinabove provided, which said answer shall be deemed effectively filed upon the entry of an order by the Commission granting such request or application.

By the Commission.

SUBSIDIARY COMPANIES,

Respondents.

File No. 59-10
Public Utility Holding Company Act of 1935,
Section 11(b)(1)

APPLICATION

102 The respondent, The North American Company, on its own behalf and on behalf of each of the other respondents herein, hereby applies for an extension of the time in which to answer the order herein issued March 8, 1940, for a period of thirty days to and including the 18th day of May, 1940, and requests that the hearing herein be postponed until the twentieth day thereafter (or such later date as the Commission may prior thereto fix by supplementary notice).

The reason for this application is as follows:

The respondent is in the course of formulating a statement of the program to be included in the answer to the

103

order herein which will be filed by the respondent pursuant to Part VI of such order. The formulation of such a statement is a difficult and complicated matter involving, as it does, serious questions of policy as well as many legal and practical considerations. The respondent finds that this task of formulation cannot be completed by April 18, 1940, but will require approximately thirty days longer.

WHEREFORE, respondent prays that the time within which it and each of the other respondents herein are required to answer the order herein issued March 8, 1940, be extended 104
for a period of thirty days to and including May 18, 1940, and that the hearing herein be postponed until the twentieth day thereafter (or such later date as the Commission may prior thereto fix by supplementary notice).

Dated, April 12, 1940.

Respondent.

File No. 59-10

Public Utility Holding Company Act of 1935,
Section 11(b)(1)

Answer of The North American Company, a respondent.

ANSWER

117

I.

The respondent, The North American Company, for its answer to the order herein issued March 8, 1940:

1. Admits each and every allegation with respect to the respondent, and on information and belief admits each and every other allegation, set forth in paragraphs 1 to 62, both inclusive, of said order, except that it:

(a) Denies that either The Washington and Glen Echo Railroad Company or St. Louis and East St. Louis

Electric Railway Company is now a subsidiary company of the respondent or of one or more of its subsidiary companies, as alleged in paragraph 5 of said order, for the reason that The Washington and Glen Echo Railroad Company was dissolved on April 23, 1939, and St. Louis and East St. Louis Electric Railway Company was dissolved on August 5, 1939.

(b) Denies on information and belief that either Midland Counties Public Service Corporation or The
119 Wayne Mining Company is now a subsidiary company of any one or more of the companies named in paragraph 6 of said order, as alleged in paragraph 6 of said order, for the reason that Midland Counties Public Service Corporation was dissolved in December, 1939, and The Wayne Mining Company was dissolved in March, 1940.

(c) Denies that Kewanee Public Service Company owns or operates facilities used for the generation of electric energy, as alleged in paragraph 25 of said order.

(d) Denies that Cahokia Manufacturers Gas Company
120 owns and operates facilities used for the production of manufactured gas for sale at wholesale, as alleged in paragraph 50 of said order, and alleges that said Cahokia Manufacturers Gas Company owns and leases to Illinois Iowa Power Company facilities in the State of Illinois used for the distribution of natural gas.

(e) Denies that either Wired Radio, Inc., or Wired Rediffusion Developments, Ltd., is now a subsidiary company of the respondent, as alleged in paragraphs 3, 60 and 61 of said order, for the reason that on April 1, 1940 the respondent transferred and delivered to Associated Music Publishers, Inc., a corporation which is not a sub-

121

sidiary of the respondent or of one or more of its subsidiary companies, all of the outstanding capital stock of Wired Radio, Inc., pursuant to an agreement between the respondent, Warner Bros. Pictures, Inc., and Associated Music Publishers, Inc., dated May 29, 1939.

(f) Denies that the allegations of paragraphs 8 to 62, both inclusive, of said order describe fully in all cases the respective businesses of the various respondents.

122

2. In answer to paragraph 63 of said order, respondent alleges that the provisions of the Act are so vague and uncertain that the respondent does not have knowledge or information sufficient to form a belief as to what constitutes a single integrated public utility system within the meaning of the Act, or as to what constitutes such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such system within the meaning of the Act.

II.

123

The respondent, The North American Company, further alleges for an affirmative defense as follows:

3. The business of respondent consists, and has consisted since shortly after its incorporation in 1890, in acquiring, owning and holding stocks and other securities of corporations doing business in different states and groups of states, for diversification and long term investment, as is more fully set forth in Part III of this answer.

4. The corporations in which respondent has so invested are each organized under the laws of one of the States of the

United States, except that one of such corporations is organized under an Act of Congress. Each of the corporations in which respondent has investments maintains an organization responsible to its own board of directors, and each functions under the control of its own board of directors subject to the laws and regulatory agencies of the State in which it is incorporated or does business.

5. Respondent is not engaged in the business of sending or transporting or causing to be sent or transported, goods,
125 commodities or services in commerce with foreign nations or among the several States, or in any other kind of interstate commerce, and such use as respondent makes of the mails or any other means or instrumentality of interstate commerce is merely incidental to the intrastate business of respondent hereinabove described.

6. Rule U-4 of the Commission permitted the respondent to register as a holding company and to take all subsequent action under the Act with full reservation of all its constitutional and legal rights, and in accordance with such rule
126 respondent has at all times fully reserved all its constitutional and legal rights.

7. The respondent, on information and belief, alleges that Section 11(b)(1) of the Public Utility Holding Company Act of 1935, and any other provisions of said Act which may be used to implement the purposes of said Section 11(b)(1), if and to the extent that they purport to require action to be taken by the respondent (including the divestment of control, securities or other assets) to dispose of its valuable investments or any substantial part thereof or to limit the operations of any of the registered holding companies named in

127

said order to a single integrated public utility system, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public utility system, are invalid, void and of no effect in that they violate and contravene the provisions of the Constitution of the United States and the Amendments thereto, in the following respects, among others: (a) they are not a valid exercise of the power of Congress to regulate Commerce among the several States, and seek to impose arbitrary and unconstitutional restrictions upon such commerce; are not a valid exercise of the power of Congress to establish Post Offices and post Roads, and seek to impose arbitrary and unconstitutional restrictions upon the use of the mails; are not a valid exercise of any power conferred by the Constitution upon Congress; and are, therefore, in violation of Article I, Section 8 of the Constitution; (b) they attempt unlawfully to delegate legislative power to the Securities and Exchange Commission, in violation of Article I, Section 1 of the Constitution; (c) they attempt to deprive the respondent and its securityholders of their property without due process of law, in violation of the Fifth Amendment to the Constitution; (d) they attempt to take the private property of the respondent and its securityholders for public use without just compensation, in violation of the Fifth Amendment to the Constitution; (e) they attempt to impose excessive fines and cruel and unusual punishments upon the respondent, in violation of the Eighth Amendment to the Constitution; (f) they attempt unlawfully to impose a Federal system of regulation and destruction upon the respondent and thereby attempt to invade and usurp powers reserved to the States, in violation of the Tenth Amendment to the Constitution; (g) they attempt to subject the respondent to

128

129

130 unreasonable searches and seizures, in violation of the Fourth Amendment to the Constitution; and (h) they seek to deprive the respondent of its rights to a judicial determination of all questions of fact affecting its constitutional rights, and thereby deprive the respondent of its property without due process of law, in violation of the Fifth Amendment to the Constitution.

III.

131 The respondent, The North American Company, without waiving any of the rights or contentions hereinabove mentioned, further states its position as follows:

8. The North American Company was incorporated under the laws of New Jersey in 1890 by a group which believed that the economic development and general welfare of this country would be promoted by the creation of a large capital fund which would be available to finance industry in various parts of the United States, particularly in the electrical field, and that this capital fund would itself be protected by poli-
132 cies of prudent and careful investment, coupled with diversification. The North American Company has now had a continuous corporate existence of fifty years, without reorganization. Throughout such fifty-year period the Company has adhered to the basic conceptions which gave it birth and which it believes to have been sound and to be of continuing validity.

The capital funds of The North American Company are now represented by $70,000,000 of debentures, more than $65,000,000 par value of preferred stock and more than $85,000,000 par value of common stock. The aggregate market value of the Company's outstanding securities on May 10,

133

1940 was approximately $330,000,000. Such securities are held by more than 2,800 debenture holders, more than 15,000 preferred stockholders and more than 58,000 common stockholders.

Throughout the Company's existence there has never been a default on any security issued by it, and the holders of securities issued by its subsidiaries have constantly benefited by the sound investment policies which it has maintained and fostered.

The North American Company has a record of outstanding achievement in the development of the electrical industry, and its subsidiaries have long been among the acknowledged leaders in the field. Consumers have benefited through a long history of rate reductions while service has constantly improved.

134

9. The North American Company made its first investment in public utility enterprises in 1890 by acquisition of an interest in certain small properties in Milwaukee, Wisconsin, and in that year also entered into a contract with Thomas A. Edison for wider applications of electric power. During the ensuing five years its interest was increased by the addition of other properties, all of which were consolidated in 1896 into The Milwaukee Electric Railway and Light Company, now named Wisconsin Electric Power Company, which is today The North American Company's principal investment in Wisconsin.

135

In 1901 The North American Company invested in one of the properties in St. Louis, Missouri, now held by Union Electric Company of Missouri, which is today one of the principal investments of The North American Company, operating in St. Louis and the adjoining area.

In 1903 The North American Company acquired its first interest in The Detroit Edison Company, and today holds a substantial investment in the stock of that company although it is not a subsidiary.

In 1922 The North American Company acquired its first interest in The Cleveland Electric Illuminating Company, which is today one of its principal investments.

In 1925 The North American Company acquired an interest in utilities in Washington, D. C., and today its principal investment in that area is in Washington Railway and Electric Company which controls Potomac Electric Power Company.

In 1925 The North American Company acquired control of Western Power Corporation, which held properties in California. Those properties were later sold to Pacific Gas and Electric Company, as a result of which The North American Company today holds a substantial investment in that company, although it is not a subsidiary.

In 1926 The North American Company acquired a substantial interest in North American Light & Power Company, the principal properties of which are in Illinois, Iowa, Missouri and Kansas.

10. All of these utility investments by The North American Company have been continuous and, in the case of the four major operating companies in Milwaukee, St. Louis, Cleveland and Washington, have been enlarged through substantial increase in the common stock equities. The money so provided has not only financed a large part of the property additions, but it has also furnished a basis of junior equity money required by the operating companies in order to enable them to obtain additional funds they needed for property additions through the sale of bonds and preferred stocks.

139

11. Under the law the responsibility for the management of the business and for the protection of the investments of The North American Company and the interests of its security holders is vested in the Board of Directors of The North American Company. These Directors believe, and it has long been their guiding principle, that the interests of their security holders must and do coincide with public policy and the general welfare. The Directors have carefully examined the Holding Company Act to ascertain whether it embodies any new and valid rule of Federal public policy, which should change their policies for The North American Company, but find that such is not the case, assuming that the Act is to be reasonably interpreted and applied. Section 1(b) of the Act enumerates certain specific abuses and Section 1(c) states that the provisions of the Act are to be interpreted with a view to the elimination of such abuses. Such abuses have never been present in the holding company system under respondent's control and the future avoidance of such abuses is already assured by the controls and regulation established by Federal and state statutes. As to Section 11(b)(1) of the Act, respondent's Directors are unable to find any proper basis for its application to The North American Company, and its provisions are so vague and uncertain in their scope that they do not, in law or in fact, provide a clear and practical guide to corporate action.

140

141

12. In the course of performance of their legal duty to manage the affairs of The North American Company in accordance with their best judgment and their own long established policies, its directors have taken or caused to be taken important steps designed to simplify the corporate structure of the holding company system and to dispose of

certain assets. The action of respondent's directors in these respects has coincided with what respondent believes to have been the views of the Commission as to the intent of Section 11(b)(2) of the Act. Among such steps during recent years may be noted:

(a) The elimination in 1939 of North American Edison Company, the principal intermediate holding company in the North American system, which had approximately $129,000,000 of securities outstanding. This was
143 an operation of such magnitude, involving the refunding of some $104,000,000 of securities, that it required the continued and concentrated attention of the management of The North American Company over an extended period and was particularly cited in the Fifth Annual Report of the Commission as having "involved the largest financing under the Public Utility Holding Company Act of 1935 to that time".

(b) The recapitalization in 1937 of Illinois Power and Light Corporation (now named Illinois Iowa Power Company) which involved a readjustment of over
144 $74,000,000 par amount or stated value of preferred and common stocks, and which was cited in the Third Annual Report of the Commission. The development and carrying out of this plan required intensive work over an extended period. Although the plan was approved by the stockholders and by the Commission, a few stockholders brought an injunction suit, which is still pending, with the result that the fruition of the benefits which the recapitalization offered to securityholders has been delayed.

(c) The simplification in 1937 of the corporate structure of the holding company system of Union Electric

145

Light and Power Company (now named Union Electric Company of Missouri). The simplification was accomplished by the merger of four public utility companies, Union Electric Light and Power Company of Illinois, Power Operating Company, Alton Light & Power Company and Alton Gas Company, which operated in and around Alton and East St. Louis, Illinois, into the East St. Louis Light & Power Co., a public utility company operating in the same area, its name being changed to Union Electric Company of Illinois.

146

This was cited in the Third Annual Report of the Commission as follows:

> "There is one outstanding example of the type of transaction by which the corporate structure of a holding company system was simplified through a merger of a number of subsidiary companies into one operating company. * * *
>
> "The result of these transactions, therefore, was the reduction of the number of subsidiaries in the North American Company system by four and a very substantial simplification in the corporate structure of its Missouri and Illinois subsidiaries."

147

These were transactions of magnitude, accompanied by the redemption of over $80,000,000 of securities and the public issue of $95,000,000 of new securities.

(d) The merger in 1938 of the former Wisconsin Electric Power Company into The Milwaukee Electric Railway and Light Company (now named Wisconsin Electric Power Company) and the segregation of the transportation properties of the latter company into a new company, The Milwaukee Electric Railway & Transport Company. This was also a transaction of magni-

148 tude, involving the redemption of over $76,000,000 of securities and the issue of over $78,000,000 of new securities.

(e) The dissolution during the past five years of fourteen subsidiary companies of Union Electric Company of Missouri: Central Mississippi Valley Electric Properties, a voluntary trust, holding public utility securities, was terminated in 1937 after transferring on liquidation all of its assets to Union Electric Company
149 of Missouri. Fort Madison Electric Company and Dallas City Light Company, electric utility companies operating in and around Fort Madison, Iowa, and Dallas City, Illinois, respectively, were dissolved in 1937 after transferring their property to Keokuk Electric Company (now named Iowa Union Electric Company). Missouri Transmission Company, an electric utility company owning a transmission line in Missouri, was dissolved in 1938 after transferring its property to Mississippi River Power Company. Blue Goose Motor Coach Co., Inc., a transportation company, was dissolved in 1936 after the sale
150 of substantially all of its tangible assets to non-affiliated interests. St. Louis Electric Light and Power Company, The East St. Louis and Suburban Company, East St. Louis Supplies Company, The Edison Electric Illuminating Company of Carondelet, The Light and Development Company of St. Louis, The Electric Company of Missouri, National Subway Company of Missouri, Carondelet Electric Light and Power Company and St. Louis and East St. Louis Electric Railway Company, all of which had become inactive companies, were also dissolved during this period.

151

(f) The dissolution during the past five years of the following thirteen additional companies: Edison Securities Corporation, an investment company, and Northwest Trading Company, a non-utility company, were dissolved in 1935. Western Power Corporation, a public utility holding company subsidiary of The North American Company, was dissolved in 1936, and its assets were distributed to the common stockholders, the principal stockholder of which was The North American Company. The Washington Interurban Railroad Company, Washington Coach Company, Washington Suburban Coach Company and Washington and Maryland Railway Company, which had become inactive companies, were dissolved in 1936. The Illuminating Securities Company, a non-utility company, was dissolved in 1937. The Power Construction Company, Overton-Williams-Pinner Company, West Kentucky Property Company and Potomac Electric Appliance Company, non-utility companies, were dissolved in 1938. The Washington and Glen Echo Railroad Company, which had become an inactive company, was dissolved in 1939.

152

153

(g) The merger, dissolution or transfer to non-affiliated interests during the past five years of thirty companies in North American Light & Power Company's system: The principal electric and gas utility properties owned by subsidiary companies in Kansas were consolidated in 1935 into one company through the acquisition by The Kansas Power and Light Company of the properties of The United Power & Light Corporation (of Kansas), The McPherson Gas Company, The Kingman County Gas Company, Public Service Company of Kansas and The Peoples Ice and Fuel Company, all of these

154 companies, other than The Kansas Power and Light Company, being dissolved. In 1935 and 1936, Illinois Power and Light Corporation (now named Illinois Iowa Power Company) sold its interest in the common stock of Super-Power Company of Illinois to Commonwealth Edison Company, which is not affiliated with The North American Company. The stock of The Kansas Pipe Line & Gas Company, a gas transmission company, was sold in 1936 to non-affiliated interests. Mills County Power Company, a public utility holding company, was dis-
155 solved in 1936. Six railroad companies, Illinois Terminal Railroad Company (previously named Illinois Terminal Company), Alton & Eastern Railroad Company, Illinois Traction, Inc., St. Louis and Illinois Belt Railway, The St. Louis, Troy and Eastern Rail Road Company and The Alton Terminal Railway Company, which owned or operated railway properties in central Illinois, were consolidated in 1937 into a new corporation, Illinois Terminal Railroad Company. The assets of Des Moines Gas Company, a gas utility company, were ac-
156 quired by Iowa Power and Light Company in 1938 and Des Moines Gas Company was dissolved. Le Roy Electric Light, Power and Heating Company and Champaign Depot and Terminal Company were merged in 1938 into Venice Gas Company. Iowa Transmission Line Company, an electric utility company, was dissolved in 1939 after the sale of its electric properties to Mississippi River Power Company. The Atchison Railway Light and Power Company, The Salina Light, Power and Gas Company, The United Water, Gas and Electric Company, North American Light & Power Company (Maine), Western Railways and Light Company, Cairo Railway

157

and Light Company, The Kansas Public Service Company, Des Moines Electric Company, Illinois Terminal Transportation Co., Illinois Terminal Railroad Company, Natural Gas Distributing Company and North American Pipe Line Company, all of which had become inactive companies, were also dissolved during this period.

(h) The North American Company disposed in 1938 of its ownership and control of Associated Music Publishers, Inc. and Breitkopf Publications, Inc., music companies, and Muzak Corporation, a wired music program 158 company, pursuant to an agreement between The North American Company and Warner Bros. Pictures, Inc., dated April 1, 1938. As already stated in paragraph 1 above, on April 1, 1940 The North American Company disposed of its ownership and control of Wired Radio, Inc., pursuant to an agreement between The North American Company, Warner Bros. Pictures, Inc., and Associated Music Publishers, Inc., dated May 29, 1939.

13. In further exercsie of their judgment with respect to the management of the affairs of The North American 159 Company, its directors propose, subject to due corporate action:

(A) To dispose of or otherwise liquidate the investment of The North American Company in North American Utility Securities Corporation, an investment company. It is planned to consummate this step as promptly as practicable.

(B) To dispose of the interest of The North American Company in West Kentucky Coal Company if and as soon as a satisfactory sale can be made. The North

160 American Company has for some time sought this result, but the conditions in the coal industry have been such that no purchaser could be found, even on terms involving some sacrifice of intrinsic value. The North American Company is unable, on this account, to forecast the time within which such sale can be effected.

(C) To dispose of its investment in The St. Louis County Gas Company, preferably, in effect, through an exchange for the electrical property in St. Louis now
161 owned by The Laclede Gas Light Company and Laclede Power & Light Company, thereby achieving a further separation of electric and of gas properties, and further integration of each of these two types of service. The North American Company and the owners of the Laclede property have for some time sought this result, and the matter is now under active consideration. It is believed that, with the cooperation of the Laclede companies, this result can be achieved within the current year.

(D) To reduce or modify the form of the investment of The North American Company in Washington Railway
162 and Electric Company to such extent that The North American Company does not have effective control over Washington Railway and Electric Company. In initiation of this program The North American Company in December 1939 paid out, as a special dividend to its stockholders, approximately six per cent of its holdings of common stock of Washington Railway and Electric Company. The North American Company is also prepared to dispose of its controlling interest in Washington Railway and Electric Company through public distribution provided there is a reasonable public market, but it is believed that prior to such relinquishment of control there should be

163

a simplification of the corporate structure by a merger of Washington Railway and Electric Company with its subsidiary, Potomac Electric Power Company. This matter has already been the subject of discussion with the regulatory authorities.

(E) To reduce or modify the form of the investments of The North American Company in Wisconsin Electric Power Company, in Wisconsin Gas & Electric Company and in Wisconsin Michigan Power Company to such extent that The North American Company does not have 164
effective control over any of those companies. The initial steps have already been taken (i) by improving the capital structure of Wisconsin Electric Power Company so as to reduce the amount required to service securities senior to the common stock, and (ii) for establishing a public market for the common stock of Wisconsin Electric Power Company. Previously, the entire common stock of that company had been owned by The North American Company. The Company proposes to proceed with the program by public or other distribution of the major portion of its holdings of stock in the three Wisconsin companies 165
as soon as conditions permit without sacrifice of intrinsic values.

(F) To dispose of its investment in North American Light & Power Company when conditions permit without sacrifice of intrinsic values. It may be advantageous to defer this pending simplification and improvement of the capital structure of the North American Light & Power system. Furthermore, certain of the properties controlled by North American Light & Power Company are now in part, and should, in the opinion of The North American Company, be further integrated with the properties of

166 Union Electric Company of Missouri by adding them to the system centering on St. Louis. The problem of creating for the North American Light & Power system a corporate structure which is simple and sound is a problem of considerable difficulty. The North American Company has already, during the seven years it has had control of North American Light & Power Company, been engaged on steps designed to promote simplification and adjustment to earning power of securities in the North American Light & Power system, such as the recapitaliza-
167 tion in 1937 of Illinois Power and Light Corporation (now named Illinois Iowa Power Company), mentioned above, which is now involved in litigation brought by a few stockholders. Further steps are obviously called for, the accomplishment of which can much more readily be assured if control of North American Light & Power Company is retained for the time being by The North American Company. It is impracticable for The North American Company to forecast with any accuracy the time required to simplify the corporate and financial structure of the North American Light & Power system
168 as a preliminary to divestment, because these matters involve public stockholders' assent and the possibility of unavoidable delay through litigation as is now occurring in the case of Illinois Iowa Power Company. The North American Company believes, however, that substantial progress can be made within a reasonable period of time.

14. The foregoing programs are in line with what The North American Company believes to be the views of the Commission as to the operation of Section 11(b)(1). If these programs can be carried out as now envisaged they will involve the disposal through sale, exchange or other means of

perhaps one-third of the present assets of The North American Company. The disposal of these particular assets would result in the divestment of The North American Company's control over electric and gas utility companies with assets having a carrying value on the books of the respective companies of approximately $450,000,000 and over other companies (including traction companies) with assets having a carrying value of approximately $200,000,000. This would, in substance, leave The North American Company, in respect of integrated systems, with (i) a system already substantially integrated, based on St. Louis and conducting operations within the adjoining states of Missouri, Illinois and Iowa, and (ii) one additional integrated system based on Cleveland.

The foregoing programs do not contemplate any present change in the Company's investments in The Detroit Edison Company and Pacific Gas and Electric Company, which investments do not constitute control.

15. Upon completion of the foregoing programs, the Company will have retained the major investments referred to in the foregoing paragraph, and will also have the proceeds received upon disposal of certain assets referred to above. Such proceeds will be available as capital resources for the acquisition of other properties which can be advantageously integrated with the systems based on St. Louis and Cleveland, or for improvements and additions to those systems, or for other investment in accordance with the sound principles which have characterized The North American Company's past activities, and with the benefit of fifty years of practical experience. The Company believes that a constructive interpretation or evolution of the Act will provide continued opportunity for the employment of its resources both in the public interest and in the interest of its stockholders.

172

16. The programs set forth above will involve great procedural difficulties in view of the provisions of many applicable Federal and state laws, the rules of the Commission and of local or state regulatory commissions and authorities, and the provisions of corporate charters, indentures and mortgages. It is believed that these programs can be carried through in two or three years, on the assumption that the executives of The North American Company are able to devote thereto their active and virtually continuous attention. Even this time forecast would have been impossible had not
173 The North American Company been actively engaged during the past several years in consummating a number of fundamental corporate adjustments designed to give it greater flexibility of action.

17. In the opinion of The North American Company it would be impracticable and would serve no useful purpose, nor would it be realistic, at the present time to consider further adjustments which, in view of the magnitude and complexity of the plans set forth above, could not in fact be realized contemporaneously therewith.

174

WHEREFORE, respondent prays that the Commission grant such relief in the premises as may be just and proper under the laws and Constitution of the United States of America.

Dated, May 16, 1940.

Motion 175

UNITED STATES OF AMERICA

BEFORE THE

SECURITIES AND EXCHANGE COMMISSION

IN THE MATTER

of

THE NORTH AMERICAN COMPANY 176

and its

SUBSIDIARY COMPANIES,

Respondents.

File No. 59-10
Public Utility Holding Company Act of 1935,
Section 11(b)(1)

Motion of The North American Company, a respondent, For Adjournment. 177

MOTION

The North American Company, a respondent in this proceeding, respectfully moves that the hearing in this proceeding be adjourned, subject to the further order of the Commission, and that this proceeding be held in abeyance, on the following grounds:

(1) That the answer of The North American Company filed with the Securities and Exchange Commission on May

178 16, 1940 in this proceeding sets forth the position of The North American Company with respect to the allegations of the Commission contained in the Notice of and Order for Hearing of the Commission, and that no further action should be taken in this proceeding until The North American Company has had a fair and full opportunity to proceed in the manner indicated in said answer, and particularly Paragraph 13 of Part III thereof.

(2) That no further action in this proceeding should be
179 taken until the Commission has made its investigations and studies and made public its recommendations as to the type and size of geographically and economically integrated public utility systems which can be best promote and harmonize the interests of the public, the investor and the consumer, which investigations, studies and recommendations the Commission is directed to make by Section 30 of the Act.

In filing this motion The North American Company reserves the right to take such other action as may be deemed appropriate in view of the Commission's action with respect
180 to this motion, including the right to move for further adjournment or for the dismissal of this proceeding, on constitutional or other grounds.

This motion is accompanied by a brief in support hereof.

This motion is made and the accompanying brief is filed in full reliance on Rule U-4, as amended, of the Commission under the Act. Neither the making of this motion nor the filing of such brief, nor the acceptance of or reliance upon any order, rule or regulation, nor the compliance with any provisions of the Act, of the rules and regulations thereunder, or of any order or direction of the Commission shall be deemed a waiver of any constitutional or legal right of

181

The North American Company or of any of its subsidiary companies, all of which are hereby expressly reserved.

189

190

UNITED STATES OF AMERICA

BEFORE THE

SECURITIES AND EXCHANGE COMMISSION

IN THE MATTER

of

THE NORTH AMERICAN COMPANY

and its

191

SUBSIDIARY COMPANIES,

Respondents.

File No. 59-10

Public Utility Holding Company Act of 1935,
Section 11(b)(1)

MOTION TO DISMISS

192 The North American Company, a respondent herein, respectfully moves for an order dismissing this proceeding on the ground that the Commission is without power or jurisdiction under the Public Utility Holding Company Act of 1935 and the laws and Constitution of the United States to make its notice and order herein dated March 8, 1940, for the following reasons:

1. The Commission is authorized and directed by Section 30 of the Public Utility Holding Company Act of 1935 (hereinafter referred to as the "Act") "to make studies and investigations of public utility companies, the territory served or which can be served by public utility companies

and the manner in which the same are and can be served, to determine the sizes, types and locations of public utility companies which do and can operate most economically and efficiently in the public interest, in the interest of investors and consumers, and in furtherance of a wider and more economical use of gas and electric energy" and upon the basis of such investigations and studies to "make public from time to time its recommendations as to the type and size of geographically and economically integrated public utility systems which, having regard for the nature and character of the locality served, can best promote and harmonize the 194
interests of the public, the investor and the consumer", and no recommendations have been made public by the Commission in accordance with the terms of Section 30 of the Act.

2. It is contrary to the provisions of the Act itself and to the intent and mandate of Congress for the Commission to proceed by notice and order pursuant to Section 11(b)(1) until the Commission has made its investigations and studies and made public its recommendations as to the type and size of geographically and economically integrated public utility systems which can best promote and harmonize the interests 195
of the public, the investor and the consumer, which investigations, studies and recommendations the Commission is directed to make by Section 30 of the Act.

3. Congress intended that these Respondents have available, and these Respondents and each of them were entitled under the Act to have made public from time to time, the Commission's recommendations in accordance with the directions contained in Section 30, so as to allow a reasonable period of time for voluntary compliance with Section

196 *Motion to Dismiss*

11(b)(1) before the Commission instituted proceedings to force compliance therewith.

4. Said notice and order, and requiring Respondents to proceed with a hearing thereon, before the Commission has made such studies and published such recommendations, would deprive Respondents of property without due process of law in violation of the Fifth Amendment to the Constitution of the United States.

197 In filing this motion The North American Company reserves the right to take such other action as may be deemed appropriate in view of the Commission's action with respect to this motion, including the right to move for an adjournment of the hearing herein or for the dismissal of this proceeding on constitutional or other grounds.

This motion is made and filed in full reliance on Rule U-4, as amended, of the Commission under the Act. Neither the making of this motion nor the acceptance of or reliance upon any order, rule or regulation, nor the compliance with any provisions of the Act, of the rules and regulations there-
198 under, or of any order or direction of the Commission shall be deemed a waiver of any constitutional or legal right of The North American Company or of any of its subsidiary companies, all of which are hereby expressly reserved.

In support of this motion The North American Company refers to Part II of its brief dated June 7, 1940, filed in support of its motion of the same date that the hearing of this proceeding be adjourned subject to the further order of the Commission, and that this proceeding be held in abeyance, and to the arguments and points therein made as fully as though said Part II of said brief accompanied this motion.

This motion is based on the records and files of the Commission under said Act.

WHEREFORE, respondent The North American Company prays that the Commission dismiss this proceeding.

ORDER DENYING MOTION TO DISMISS

204

The respondent, The North American Company, having on June 18, 1940, filed with this Commission a motion to dismiss the above entitled proceeding, and the Commission having fully considered the same, and finding that the ground of said motion is substantially identical with the second ground assigned by said respondent for the granting of a motion filed with this Commission on June 7, 1940, whereby said respondent moved that the hearing in said proceeding be adjourned subject to further order of the Commission, and that said proceeding be held in abeyance, which motion was by order of this Commission of June 7, 1940

denied, except to the extent that the hearing theretofore set herein for June 7, 1940, was continued to June 21, 1940 and it appearing to the Commission, and the Commission finding that the present motion to dismiss this proceeding should likewise be denied;

IT IS ORDERED that the motion filed on June 18, 1940, by respondent, The North American Company, for the dismissal of the above entitled proceeding be, and the same is hereby denied.

By the Commission. 206

SUBSIDIARY COMPANIES

Respondents

File No. 59-10

Public Utility Holding Company Act of 1935—
Section 11(b)(1)

FINDINGS AND OPINION OF THE COMMISSION

INTEGRATION OF HOLDING COMPANY SYSTEMS 219

Selection of Principal System

Where registered public utility holding companies which are respondents in proceedings under Section 11(b)(1) failed to indicate a choice of the principal systems they desire to retain, *held* Commission will base opinion upon a single integrated public utility system under the control of each such company as its principal retainable system and give such companies further opportunity to make appropriate argument as to the choice of any other single or principal system.

220 *Findings and Opinion of the Commission*

Where holding company failed to indicate a choice of a principal system and where a full record is presented to the Commission upon which final and definitive action may be taken, *held* that request for orders in the alternative indicating what additional systems and what other businesses may be retained in addition to various integrated utility systems controlled by such holding company is denied, particularly in view of number of systems and complexities which would be involved in making alternative findings.

221 *Additional Systems*

Geographical Limitations of Section 11(b)(1)(B)

Where registered holding company claims it may keep additional systems located anywhere in United States as long as each of States in which systems are located adjoins some other State in which systems controlled by the registered holding company are located, *held* the claim is invalid and that Section 11(b)(1)(B) bars retention of additional systems located elsewhere than in State in which principal system operates, or in States adjoining such a State, or in a
222 foreign country contiguous thereto.

Where two States are separated by a lake and have no common boundaries on land, but have such boundaries in the lake, *held* such States adjoin.

Additional Systems

Substantial Economies under Section 11(b)(1)(A)

Where claim is made that standard of Section 11(b)(1)(A) may be met in respect of additional systems if it is shown that economies merely more than nominal would be lost by severance of such systems from the holding company rela-

tionship, *held* the term "substantial economies" in Section 11(b)(1)(A) connotes "important" economies, and the degree of importance must be measured against the general policy of limiting a holding company to control of a single integrated utility system.

Additional Systems

Localized Management, Efficiency, Effectiveness of Regulation under Section 11(b)(1)(C)

Where registered holding company controls utility sys- 224
tems surrounding large cities in different widely scattered sections of the country, *held* the standard of localized management in Section 11(b)(1)(C) would not be satisfied by retention of such systems in combination.

Where a registered public utility holding company engaged in the natural gas production, transmission and wholesale business, controls a retail natural gas system which receives most of its gas from non-affiliated sources and it cannot be found that retention of such retail system would satisfy clauses (A) and (C) of Section 11(b)(1), *held* that it must be disposed of. 225

Combination of Gas and Electric Properties as Single Integrated System

Where claim is made that integrated gas and electric utility systems may be considered as constituting a single integrated public utility system, *held* gas and electric utility properties cannot, in combination, be regarded as a single integrated utility system under the Act.

Where Commission desires additional evidence to aid in determination as to whether the joint control of gas and

electric systems would satify clauses (A) and (C) of Section 11(b)(1), *held* the record will be reopened for the presentation of further evidence pertinent to that issue.

Other Businesses Retainable

Where registered public utility holding company holds securities of public utility companies which are subsidiaries within the meaning of the Act, *held* retention of such securities is permissible only if the subsidiary serves as the
227 principal, or a permissible additional system under clauses (A), (B), and (C) of Section 11(b)(1), and that such retention is not covered by the "other business" clauses.

Where registered public utility holding company holds interests in non-utility enterprises, *held* that the retention of such interests will not be held to be in the public interest unless it is shown that the public will benefit by the holding company's retention of the non-utility interest by reason of the relation of such non-utility business to economy of management and operation and the integration and coordination of related operating properties.

228 Where a registered public utility holding company held interests in a company engaged in the transportation business, and such registered public utility holding company was authorized to acquire such interests, by a Joint Resolution of Congress adopted prior to passage of the Act, *held* such Joint Resolution does not bar the Commission from ordering divestment of such interests if the standards of Section 11(b)(1) are not met.

Where claim was made that an investment in a non-utility business offers diversity to the operations of a holding company system and such interest should therefore be retained, *held* that the mere fact that an investment offers diversity

affords no justification under Section 11(b)(1) for its retention by a public utility holding company.

Where in 35 years of a coal company's existence it has not been found feasible to use the output from such company's mines in the permissible utility operations of a holding company system, *held* an interest in such company represents merely an investment in a business which bears no relation to the system's permissible utility operations, and such interest must be disposed of.

Where close operating relationship between the steam and the electric departments of a utility company is shown, 230
held the steam business may be retained under the "other business" clauses of Section 11(b)(1).

Where almost entire output of a coal company controlled within the holding company system is devoted to the permissible utility operations of such system, and where other facts show intimate relationship between coal company and retainable utility operations, *held* such coal company may be retained under the "other business" clauses of Section 11(b)(1).

Where 11-mile railroad having a relatively small amount 231
of property transports as its principal cargo a large portion of the coal consumed in permissible utility operations of a holding company system and where the mine from which such coal comes has been found to be retainable, *held* the railroad may be retained under the "other business" clauses of Section 11(b)(1).

Where a registered public utility holding company owns directly facilities used in the production and transmission of natural gas and holds the securities of gas utility companies, *held* the retention of such directly-owned production and transmission facilities satisfies the "other business"

clauses of Section 11(b)(1) with respect to a principal natural gas utility system which receives its gas supply from such registered public utility holding company and is closely related to the production and transmisison facilities.

Where, in support of the contention that certain non-utility interests may be retained under Section 11(b)(1), it is claimed that difficulty would be presented in attempting to dispose of such interests, *held* difficulty of disposition has no relation to permissibility of retention under Section
233 11(b)(1), but is relevant only to the time of compliance with orders of disposition.

Integrated Electric Utility System

Where a public utility company operates in areas having utility assets not physically interconnected with those in other service areas of such company except that such assets are physically interconnected with the facilities of non-affiliated companies whose facilities are in turn connected with the main service areas of such company, and it is not shown that the facilities in such isolated areas are physically oper-
234 ated in connection with the facilities in the main service areas as a single interconnected and coordinated system, *held* the electric utility facilities in both isolated and main areas cannot be regarded together as a single integrated public utility system.

APPEARANCES:

Ralph C. Binford, Herman Odell, and *Ester M. Calkin,* for the Public Utilities Division of the Commission.

Sullivan & Cromwell, New York, New York, *S. Pearce Browning, Jr.,* and *Charles S. Hamilton, Jr.,* of counsel for

The North American Company and its subsidiaries, other than North American Light & Power Company and its subsidiaries.

Schenker & Schenker, New York, New York, by *David Schenker,* for North American Light & Power Company and its subsidiary companies.

This proceeding under Section 11(b)(1) of the Public Utility Holding Company Act of 1935 was instituted by a 236
notice of and order for hearing issued by the Commission on March 8, 1940, and duly served, naming as respondents The North American Company (hereinafter sometimes referred to as "North American") and its subsidiary companies.[1] This order, which was based upon an examination by the Commission of the holding company systems of North American and its subsidiaries, set forth various factual allegations and stated further that it appeared to the Commission that:

> "The holding company system of The North American 237
> Company is not confined in its operations to those of a single integrated public utility system within the meaning of the Act, and to such other businesses as are reasonably incidental, economically necessary or appropriate to the operations of such integrated public utility system."

The respondents were ordered to answer, "admitting, denying, or otherwise explaining their respective positions" as to the allegations made. The order further provided:

---

[1]Appendix A sets forth the names of these subsidiaries, the states of their organization and the nature of their business.

"Any such answer may include a statement of the claim of the respondents or any of them as to (a) the action, if any, which is necessary and should be required to be taken by any of the respondents (including the divestment of control, securities or other assets), to limit the operations of each of the registered holding companies hereinbefore named to a single integrated public-utility system and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system; (b) the extent to which any of said respondents which
239 is a registered holding company should be permitted to control one or more additional integrated public-utility systems as may meet the requirements of Clauses (A), (B) and (C) of Section 11(b)(1) of the Act; and (c) the extent to which any of said respondents should be permitted to retain an interest in any business (other than the business of a public-utility company as such) as provided by Section 11(b)(1) of the Act. The answer of any respondent which is a registered holding company may, if such respondent so desires, state that such respondent proposes and is prepared to take such action as will cause it to cease to be a holding company within the meaning of the Act, together with a description of
240 such action and the time within which it proposes to take such action."

North American filed its answer on May 16, 1940. With minor exceptions, the factual allegations of the order of March 8 were admitted. However, it was claimed that the Act was so "vague and uncertain" that the respondent had no knowledge or information sufficient to form a belief as to what constitutes a single integrated public utility system and such other businesses as may be retained thereunder. Section 11(b)(1), and other sections of the Act implemen-

241

tary thereto, were alleged to be unconstitutional.[2] The answer also set forth a program of proposed action modifying the system in some respects. The proposed program contemplated, *inter alia*, the retention by North American of Union Electric Company of Missouri, one of North American's principal subsidiaries, and use of the proceeds of liquidation of other holdings for the acquisition of properties which could be integrated with the properties of Union Electric. It was stated that this program was based "only upon the hypothesis of voluntary action by the respondent and shall not be construed as restricting the issues otherwise arising in this proceeding."

242

The admitted subsidiaries of North American also filed answers, almost identical in form, admitting, with minor exceptions, the factual allegations in our order of March 8, and raising issues similar to those raised in North American's answer.

On June 7, 1940, North American moved to have the proceedings held in abeyance pending voluntary fulfillment of the program set forth in its answer, and until the Commission made investigations, studies, and public recommen-

243

[2]We have repeatedly expressed the view that we have no authority to pass on the constitutionality of the legislation which we administer; we must proceed upon the assumption that the Act is constitutional unless and until a court in an appropriate proceeding declares otherwise. *Engineers Public Service Company*, 9 S. E. C. —— (1941), Holding Company Act Release No. 2897; *International Utilities Corporation*, 10 S. E. C. —— (1941), Holding Company Act Release No. 3047. See also *Panitz* v. *District of Columbia*, 112 F. (2d) 39 (App. D. C. 1940); *Walston & Co.*, 5 S. E. C. 112, 113 (1939); *J. A. Sisto & Co.*, 7 S. E. 647, 653 (1940). Counsel appear to recognize this principle and we assume that the question of constitutionality has been raised here only for the purpose of preserving it in the event of any possible judicial review.

dations under Section 30 of the Act. On June 18 North American moved for a dismissal of the proceedings, basing its motion on the argument that the Commission is without power to issue an order instituting a proceeding under Section 11(b)(1) of the Act until it has made investigations, studies, and public recommendations under Section 30 of the Act, and further alleging that the notice and order instituting these proceedings before studies and recommendations were made under that section would deprive respondents of "property without due process of law in violation of the Fifth Amendment to the Constitution of the United States."

245

Both motions were denied.[3]

Upon denial of the application of The Detroit Edison Company under Section 2(a)(8) of the Act for an order

---

[3]Somewhat similar motions were filed at about this same time in various proceedings under Section 11(b)(1) involving other systems. In disposing of such motions, we directed that the notices served in such cases be supplemented by a more detailed statement of the Commission's tentative conclusions with respect to the action which "the Commission has tentatively concluded to be necessary under the provisions of Section 11(b)(1)." *See, e.g., The United Gas Improvement Company, et al.*, 7 S. E. C. 341 (1940); *The Commonwealth & Southern Corporation, et al.*, 7 S. E. C. 369 (1940); *Engineers Public Service Company, et al.*, 7 S. E. C. 371 (1940). However, it appears that in this case the respondents did not desire any such supplemental statement of the Commission's tentative conclusions as to what action the Commission tentatively believed necessary for the North American system under Section 11(b)(1). Rather, it appears that respondents' motion was based on the theory that the Commission is required to make a general survey and general recommendations with respect to the entire public utility industry before instituting any specific proceeding under Section 11(b)(1). Our views on the issues thus raised under Section 30 of the Act are set forth at length in an opinion to be issued shortly in the proceeding under Section 11(b)(1) with respect to The Commonwealth & Southern Corporation, et al.

246

247

declaring it not to be a subsidiary of North American,[4] we issued, on August 12, 1940, a supplementary notice and order naming that company and its subsidiaries as respondents. The Detroit Edison Company answered both the original and supplementary orders.

Pacific Gas and Electric Company, whose application for an order declaring it not to be a subsidiary of North American was then pending, filed a separate and supplemental answer to the order of March 8. The application for a declaration that it is not a subsidiary of North American was denied on September 11, 1941.[5]

248

On April 9, 1941, counsel for North American moved that the proceeding be dismissed as to certain subsidiaries on the ground that they had been dissolved, or that North American no longer had any interest in them. No objection has been made to this motion, and we think it may properly be, and it is hereby, granted.[6]

Requests for leave to intervene filed by the Public Service Commission of the State of Wisconsin and the Public Utilities Commission of the District of Columbia, the States of Delaware and Maine were granted. After the hearings herein

[4]*The Detroit Edison Company*, 7 S. E. C. 968 (1940). A petition for review of our order was denied in *The Detroit Edison Company* v. *Securities and Exchange Commission*, 119 F. (2d) 730 (C. C. A. 6th, 1941). Certiorari was denied in 62 S. Ct. 105 (1941).

[5]*Pacific Gas and Electric Company*, 9 S. E. C. ——, Holding Company Act Release No. 2988. A petition for review of our order is pending in the Circuit Court of Appeals for the Ninth Circuit.

[6]The companies as to which this motion relates are Washington and Glen Echo Railroad Company, St. Louis and East St. Louis Electric Railway Company, Wired Radio, Inc., Wired Rediffusion Developments, Ltd., St. Charles Electric Light and Power Company, Lakeside Light and Power Company, Wisconsin General Railway Company, Bloomington and Normal Railway, Electric and Heating Company, Decatur Light, Heat and Power Company, Elkhart Electric Light Company, Chicago and Electric Valley Railroad Company.

were terminated, the City of Jacksonville, Illinois, served by Illinois Iowa Power Company, requested and was granted leave to intervene and present additional evidence subject to reply by respondents.

Hearings were begun on June 21, 1940, and terminated on April 15, 1941. In this period the record was developed to present a detailed description of the holding company systems of North American and its subsidiaries. Requested findings and briefs were filed[7] and we heard argument.

251 *The North American Company and Its Subsidiaries*—North American is the top holding company in a system containing 80 companies which operate in New York, Maryland, the District of Columbia, Virginia, Ohio, Michigan, Wisconsin, Illinois, Iowa, Missouri, Kansas, Nebraska, Minnesota, Texas, Oklahoma, South Dakota, Kentucky, and California. The businesses engaged in by system companies include those of holding companies, electric utilities, gas utilities, natural gas production and transmission, steam and hot water heating, water supply, urban, interurban and railroad transportation, terminal and warehousing, real estate, coal mining, ice manufacturing and distribution, trucking, parking
252 lot and filling station operations, meter servicing, heavy appliance design and manufacture, amusement park operations, investment companies, oil drilling and gasoline extracting.

Electric utility operations are conducted by system companies in the District of Columbia, Maryland, Virginia, Ohio, Michigan, Wisconsin, Illinois, Iowa, Missouri, Kansas,

---

[7]North American Light & Power Company (hereinafter sometimes called "Light & Power"), a subsidiary of North American and a registered holding company, filed a separate request for findings and a separate brief, on behalf of itself and its subsidiaries.

and California. Appendix B attached hereto conveys some idea of the magnitude of the system's electric operations alone. Excluding The Detroit Edison Company and Pacific Gas and Electric Company,[8] it shows that approximately 64,700 square miles of territory, with an approximate population of 6,500,000 persons, and an aggregate of 1,700,000 customers, are served. The addition of The Detroit Edison Company increases the total population of the areas served to 2,580,000 persons, yielding a total of 9,080,000.

North American system companies render gas service 254
in the States of Iowa, Missouri, Nebraska, Minnesota, Illinois, Kansas, Wisconsin, Michigan, and California.

The consolidated balance sheet of North American and subsidiaries, attached hereto as Appendix C, states the assets of the system at $957,063,677, as of December 31, 1940. Appendix C also contains a consolidated income statement of North American and its subsidiaries as of the same date.[9]

Through the ownership of securities, directly and indirectly, of the companies in its system, North American controls an empire whose aggregate value is stated at a figure 255
in excess of $2,300,000,000.

A chart of the system, showing the corporate relationships of companies therein and the percentages of voting

---

[8]As has been indicated, at the date of the institution of this proceeding, applications were pending under Section 2(a)(8) for orders declaring The Detroit Edison Company and Pacific Gas and Electric Company not to be subsidiaries of North American; consequently, these companies and their subsidiaries were excluded in many of the computations made with respect to the extent of the operations of the North American system.

[9]It should be noted that the policy of North American is to include in its consolidated financial statements only subsidiary companies in which it holds directly or through subsidiaries voting control and 75% or more of the common stock.

power held by North American and its subholding companies, is attached as Appendix D.

Appendix E is a map showing the location of the electric service territories of the system.

Appendix F is a map showing the location of gas operations of the system.

Appendix G is a map showing the distances of various focal points in the areas served from the central offices of North American at 60 Broadway, New York City .

257 It is to this system that we must now apply the standards of Section 11(b)(1). That section provides that it shall be the duty of the Commission, as soon as practicable after January 1, 1938:

> "(1) To require by order, after notice and opportunity for hearing, that each registered holding company, and each subsidiary thereof, shall take such action as the Commission shall find necessary to limit the operations of the holding-company system of which such company is a part to a single integrated public-utility system, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system: *Provided, however,* That the Commission shall permit a registered holding company to continue to control one or more additional integrated public-utility systems, if, after notice and opportunity for hearing, it finds that—
>
> "(A) Each of such additional systems cannot be operated as an independent system without the loss of substantial economies which can be secured by the retention of control by such holding company of such system;
>
> "(B) All of such additional systems are located in one State, or in adjoining States, or in a contiguous foreign country; and

258

"(C) The continued combination of such systems under the control of such holding company is not so large (considering the state of the art and the area or region affected) as to impair the advantages of localized management, efficient operation, or the effectiveness of regulation.

"The Commission may permit as reasonably incidental, or economically necessary or appropriate to the operations of one or more integrated public-utility systems the retention of an interest in any business (other than the business of a public-utility company as such) which the 260
Commission shall find necessary or appropriate in the public interest or for the protection of investors or consumers and not detrimental to the proper functioning of such system or systems."

This opinion will deal not only with the holding company system of North American itself, but also with the status under Section 11(b)(1) of each holding company system headed by subsidiaries of North American (except for the holding company system headed by Light & Power) which are themselves registered holding companies. Subsequent to the closing of the record herein and pursuant to proceed- 261
ings under Section 11(b)(2) of the Act, we ordered the dissolution of Light & Power. 10 S. E. C. —— (1941), Holding Company Act Release No. 3233. We assume that Light & Power will be dissolved in accordance with our order and that there will no longer be a holding company system headed by Light & Power. Consequently, any discussion of the requirements of Section 11(b)(1) as they affect the Light & Power system would be academic. However, the dissolution of Light & Power will not *per se* affect the impact of Section 11(b)(1) on the holding company systems headed by subsidiaries of Light & Power which are themselves regis-

tered holding companies. Those subsidiaries are respondents in this proceeding and, accordingly, we must order them and the holding company systems which they head to comply with the requirements of Section 11(b)(1).

The holding company systems to be considered, in turn, are headed by the following registered holding companies (which are listed with appropriate indentations to indicate their relationship to North American and to one another):

I The North American Company

263 II Union Electric Company of Missouri

III Washington Railway and Electric Company

IV Washington and Rockville Railway Company of Montgomery County

(North American Light & Power Company)

V Northern Natural Gas Company

VI Illinois Traction Company

VII Illinois Iowa Power Company

VIII Des Moines Electric Light Company

I. The Holding Company System of The North American Company

264

A. *The Principal System*—The initial problem faced in the determination of what "one or more additional integrated public-utility systems" the Commission "shall permit a registered holding company to continue to control" in addition to its operation of "a single integrated public-utility system" is the determination of what the "single" or "principal" system shall be. North American has insisted on its right to choose the principal system, but it has also insisted that the Act "does not require, either expressly or by implication, that the holding company designate which of the

265

systems shall be its principal system." Although it has had adequate opportunity, and although it has been requested to do so on several occasions, North American has not yet expressly stated its choice of a principal system, basing its failure to do so on the contention that it should be free to dispose of its non-retainable properties "as circumstances permit" without being "bound in advance to determine which system would be retained." We are requested to issue an alternative order, for which "precedent" is said to be found in the Section 11(b)(1) proceedings relating to Engi-
266
neers Public Service Company[10] and Commonwealth & Southern Corporation.[11]

We do not believe an alternative order is necessary, nor do we think that it would be appropriate to a disposition "as soon as practicable" or the issues here raised.

The procedure of alternative findings in the preliminary stages of the *Engineers Public Service Company* and *Commonwealth and Southern Corporation* cases was adopted because, under the particular circumstances there presented, it did not appear that such procedure would produce any substantial complications or result in any material delay.
267
But in this case, where there are eight subsidiary holding company systems under North American, the combinations necessary in the making of findings under the (A), (B), (C), and "incidental business" standards, and in the issuance of alternative orders, would lead to extreme complications. Moreover, as distinguished from the fact that the alternative finding procedure adopted in the two cases cited was utilized only in the intermediate stages of those proceedings, this

---

[10] 9 S. E. C. —— (1941), Holding Company Act Release No. 2897.

[11] Holding Company Act Release No. 2626 (1941).

case has now reached the stage where hearings have been completed and where our findings and order can be based on a record presented to us as full and complete. Frequent calls have been made upon North American during the course of the proceeding from service of our original order of March 8, 1940, through the hearings and at oral argument, but it has refused to express any choice of a principal system. There has been little point to the labor of considering what purports to be a complete record if we are now merely to await the pleasure of North American before disposing of
269 the issues. Nor can we disregard the fact that the statute makes it the "duty" of the Commission to require compliance with Section 11(b) "as soon as practicable after January 1, 1938."

Accordingly, in our opinion and order we have taken the integrated electric system operated by Union Electric Company of Missouri and its subsidiaries (the Union group) as the "principal system" retainable by North American. Our reasons for basing our opinion and order on retention of the Union group as the "principal system" are (1) the indi-
270 cation by North American that it would prefer that choice, (2) we would regard the retention as appropriate if called upon to pass upon the choice of this system by North American.

(1) North American has, on several occasions, indicated that, if required to choose a principal system, it would choose the Union group. In the tentative program set forth in its answer, it contemplated retention of its "major investment" in the Union group, and use of the proceeds of liquidation of other holdings for the acquisition of properties which could be "integrated" with the Union group system. Its counsel, in oral argument, stated, as an "educated guess," that North American would choose to retain the Union group

as the principal system if it were required to make an election.

(2) We would regard as appropriate the choice of the Union electric utility system as North American's principal system. As of July 31, 1940, Union Electric Company of Missouri had the following capitalization:

First Mortgage and Collateral Trust Bonds, 3¾%, due 1962	$80,000,000
3% Notes, due 1942	15,000,000
Advances on open account from subsidiaries.	6,800,000
$5 Cumulative Preferred Stock, no par	13,000,000
Common Stock, no par	52,500,000
Surplus	10,200,000

272

North American calculates its equity in the assets of the Union system (including surplus) at 33.4% of the total capitalization. It holds all of the common stock, representing 25.81% of the total capitalization. This stock was carried on its books, at December 31, 1940, at $51,840,780. Union Electric Company of Missouri in turn has the following interests in the total capitalization, including surplus, of its principal operating subsidiaries:

273

Union Electric Company of Illinois	100%
Cupples Station, Light, Heat and Power Co.	100%
Mississippi River Power Company	44.53%
Iowa Union Electric Company	63.29%

Dividends received by North American from Union of Missouri for 1940 amounted to approximately $5,737,500, the largest amount paid up, in that year, by any of its subsidiaries. North American's investment in the Union system began in 1901. There have thus been 40 years of investment contact with the Union properties.

274 *Findings and Opinion of the Commission*

Union of Missouri, together with the above-named subsidiaries, operates an electric utility system in the States of Missouri, Illinois, and Iowa. These operations are carried on in an area centering around St. Louis in the eastern part of Missouri, in adjoining territory in Illinois surrounding the City of East St. Louis, in an area surrounding a large hydroelectric plant at Keokuk, Iowa, and in and around a hydro plant at Osage, Missouri.

The total area served by the group contains 3,100 square miles and a population of 1,500,000. As of May 31, 1940, the
275 group served a total of 351,565 customers with electricity and, in the year ending on that date, produced a total of 2,579,520,155 kwh of current. Of a total name plate production capacity rating of 722,500 kw, 237,000 kw are hydro and 485,500 kw are steam.

All production facilities for electric operations of the group are at present physically interconnected and centrally controlled, and are coordinated without reference to differences in corporate ownership. Transmission line connections between generating stations make it possible to operate the system as an entity—coordinating, as economy and neces-
276 sity require, the hydro and steam production units. The group owns transmission, sub-transmission, and distribution lines and sub-stations for the carrying of its produced current.

The operations in Missouri are subject to regulation by the Missouri Public Service Commission, and in Illinois by the Illinois Commerce Commission. Iowa Union Electric Company, which operates in Iowa, is subject to municipal rate regulation.

We find that these electric operations of the Union group constitute those of a single integrated electric utility system

within the meaning of the Act, and that the retention thereof as the principal system of North American satisfies the terms of Section 11(b)(1).

Although, for the reasons indicated, we have based our opinion and order on retention of the electric utility operations of the Union group as North American's principal system, we have decided to afford North American a further opportunity to present argument as to whether it desires any system other than the electric utility operations of the Union group as its principal system. Accordingly, we shall entertain a request for further argument in this respect and 278
our order, insofar as it requires divestment by North American, will be subject to modification if, after presentation of further argument, such modification appears necessary.

B. *The Additional Systems Retainable by North American*—Excluding subsidiaries of Light & Power, North American subsidiaries operate electric, gas, and other facilities in five distinct areas in addition to the St. Louis area of the Union group. These are the Washington area (including the District of Columbia and adjacent Maryland and Virginia territory) in which subsidiaries of Washington Railway and 279
Electric Company operate; the Cleveland area (including that city and surrounding territory in northeast Ohio) in which Cleveland Electric Illuminating Company, a direct subsidiary of North American, operates; the Detroit area (including a large area surrounding that city in southeast Michigan) in which The Detroit Edison Company operates; the Wisconsin-Michigan region (including three areas, two centering respectively around Milwaukee in southeast Wisconsin and Appleton in east central Wisconsin, and one embracing a large part of the northern peninsula of Michigan

280 *Findings and Opinion of the Commission*

and running south into Wisconsin) in which the Wisconsin Electric Power, Wisconsin Gas and Electric, and Wisconsin-Michigan companies (all direct subsidiaries of North American)[12] operate; and the California area, in which Pacific Gas and Electric Company operates.

Counsel for the Public Utilities Division has conceded, and we find, that the electric operations in each of the Washington, Cleveland, Wisconsin-Michigan, and Detroit areas constitute those of a single integrated public utility system within the meaning of the Act.

281 It is of course clear that Section 11(b)(1) requires that a registered holding company divest itself of those of its utility subsidiaries which are not retainable as part of the holding company's principal system or as part of an additional system or systems meeting the requirements of the (A), (B), and (C) clauses of Section 11(b)(1). *The United Gas Improvement Company and Its Subsidiary Companies*, 9 S. E. C. —— (1941), Holding Company Act Release No. 2692, p. 11. It is clear, too, that the standards of the (A), (B), and (C) clauses for additional systems are in the conjunctive and that each must be satisfied to permit retention

282 of additional systems.

North American claims that under the (A), (B), and (C) standards, it may retain the Union, Wisconsin-Michigan, and Cleveland systems. It has made no claim that these standards would permit the retention of any of the other systems operated by its subsidiaries.

---

[12]Since the closing of this record, we have approved transactions whereby North American has transferred its holding in the Wisconsin Gas and Electric Company and Wisconsin-Michigan Power Company to Wisconsin Electric Power Company, 9 S. E. C. —— (1941), Holding Company Act Release No. 2950.

For the reasons set forth below, we do not believe that the standards of the (A), (B), and (C) clauses of Section 11(b)(1) permit the retention of any of these systems as "additional systems" to the Union group. We think that North American's claim is based on a misconstruction of the geographical limitations of clause (B), of the meaning of the phrase "substantial economies" in clause (A), and of the limitations of clause (C).

1. *The Geographical Limitations of Section 11(b)(1)(B)* —The meaning of clause (B) was the subject of extended consideration in the *Engineers Public Service Company*[13] case. 284
We there concluded that under clause (B) (even assuming compliance with clauses (A) and (C)) additional systems could be retained only if they are:

> "located in a State in which such single system [*i.e.*, the 'principal' system] operates, or in States adjoining such a State, or in a foreign country contiguous thereto."

The electric operations of the Union group, which we have taken as the principal system, are carried on in Missouri, Illinois, and Iowa. Clause (B), therefore, clearly bars 285
the retention of the Cleveland, Washington, and California utility operations as additional systems. Whether the integrated electric utility system of the Wisconsin-Michigan companies can be retained under clause (B) as a system additional to the Union system depends on whether the former system is "located . . . in States adjoining" a State in which the Union group operates. Of course, Wisconsin and Illinois have common boundaries; but most maps leave ambiguous the status of Michigan and Illinois as "adjoining." The latter

[13] 9 S. E. C. —— (1941), Holding Company Act Release No. 2897.

286 *Findings and Opinion of the Commission*

two states are, apparently, completely separated by Wisconsin, Indiana, and Lake Michigan. They "adjoin" only if their boundaries in fact meet in Lake Michigan. We have concluded that Illinois and Michigan may properly be regarded as "adjoining" by reason of common boundary lines.

"Illinois was admitted as a State with its present boundaries by resolution approved December 3, 1818 (3 Stat. L. 536). The enabling act defines these boundaries as follows: (3 Stat. L. 429)

287 "The said State shall consist of all the territory included within the following boundaries, to wit: Beginning at the mouth of the Wabash river; thence up the same and with the line of Indiana, to the northwest corner of said state; thence, east with the line of the same state, to the middle of Lake Michigan; thence north along the *middle of said lake* to the north latitude forty-two degrees thirty minutes; thence west to the middle of the Mississippi river; and thence down along the middle of that river to its confluence with the Ohio River; and thence up the latter river along its northwestern shore to the beginning."[14] (Emphasis supplied.)

* * *

288 "Michigan was admitted to the Union on January 26, 1837 (5 Stat. L. 144) with the proviso and boundaries given in the enabling act as follows: (5 Stat. L. 49)

" . . . thence (from the main channel of the Menomonie River) . . . to the center of the most usual ship channel of the Green bay of Lake Michigan; thence through the center of the most usual ship channel of the said bay to the *middle of Lake Michigan;* thence through the *middle of Lake Michigan*, to the northern boundary of the State of Indiana, as that line was established by

[14]United States Department of the Interior, Geological Survey Bulletin 817, "Boundaries, Areas, Geographic Centers, and Altitudes of the United States and the Several States" (2nd Ed.), p. 193.

the act of Congress of the nineteenth of April, eighteen hundred and sixteen; thence due east, with the north boundary line of the said State of Indiana, to the north-east corner thereof; and thence, south, with the east boundary line of Indiana to the place of beginning."[15] (Emphasis supplied.)

Since we find that Michigan and Wisconsin adjoin Illinois, a State in which the Union group operates, we hold that the retention of the Wisconsin-Michigan system would not be barred by clause (B).[16]

290 North American's counsel has attempted to justify the retention of the Cleveland properties on the ground that:

"Wisconsin adjoins Illinois—we have properties in Wisconsin; Michigan adjoins Wisconsin—we have properties in Michigan, in the northern peninsula there; and we have properties in Ohio which adjoin [*sic*] Michigan." (Oral Argument, p. 58).

This might be characterized as the "chain" theory of clause (B). Carried to its logical conclusion, it would permit the retention of properties from one coast of the country to the other, as long as the holding company retains property in each State of the chain of States. 291 We think that the invalidity of this contention is too apparent to require further comment here. See our discussion of clause (B) in the *Engineers Public Service Company* case (*supra*).

---

[15] *Id.*, p. 197.

[16] By the same reasoning, clause (B) would not bar retention of the Detroit Edison system as an additional system. However, North American has not claimed that such retention is permissible under the standards of clauses (A), (B), and (C), and has not attempted to prove compliance with the standards of clauses (A) and (C), but has argued that its "investment" in that company may be retained on other grounds. This problem will be dealt with later in this opinion.

We conclude, therefore, that, based on the electric utility operations of the Union group as North American's principal system, clause (B) bars retention of the systems of the Cleveland, Washington, and California companies. It does not bar retention of the integrated systems of the Wisconsin-Michigan group or of The Detroit Edison Company.[17]

Nevertheless, we have concluded that retention of the Wisconsin-Michigan or Detroit properties as additional systems to that of the Union group is not permissible under the standards of clauses (A) and (C).

293

2. *The Standard of "Substantial Economies" in Section 11(b)(1)(A)*—We cannot permit the retention of "additional systems" by a registered holding company unless we find that the standards of clauses (B) and (C) have been satisfied and that, in accordance with clause (A):

> "Each of such additional systems cannot be operated as an independent system without the loss of substantial economies which can be secured by the retention of control by such holding company of such system."

294 The phrase "substantial economies" in clause (A) refers to economies which may be secured by the systems themselves rather than to economies which may be secured by the holding company. This was the clear intent of Congress (see H. R. Rep. No. 1903, 74th Cong., 1st Sess. (1935), p. 71) and, in fact, argument by all counsel in this case has been premised on this view.

Counsel for North American has, however, attempted to minimize the requirement of "substantial economies" and

---

[17] The question of the retention of integrated systems or properties of subsidiaries of Light & Power as additional to the Union system is referred to in note 19, *infra*.

295

to argue that the phrase means only something more than "purely nominal" or "*de minimis*" economies. In support of this proposition, counsel has cited cases involving will contests, taxation, evidence, and exemption from the Act under Section 3(a)(1).

We think that the cases which have been cited are of little aid in the interpretation of the phrase "substantial economies" and that the phrase must, rather, be construed in the light of its context and the policy of the Act. The normal and usual meaning of the word "substantial" is a meaning connoting "important". And we think that this normal and usual meaning is compelled here. The degree of importance must be measured against the vital policy to which clause (A) is an exception, *i.e.*, the policy of limiting holding companies to the operation of a single integrated public utility system.

296

Some light on the background against which this clause was drafted may be found in certain remarks made by Senator Wheeler in interpreting the action taken by the Conference Committee on the legislation.

> "After considerable discussion the Senate conferees concluded that the furthest concession they could make would be to permit the Commission to allow a holding company to control more than one integrated system if the additional systems were in the same region as the principal system *and were so small that they were incapable of independent economical operation . . .*"[18]

297

These remarks reinforce the conclusion that clause (A) was intended as a significant standard to be applied only where there was a strong reason for an exception to the general policy of permitting retention of only one integrated

[18]79 Cong. Rec. 14479. (Emphasis supplied.)

system. They are certainly not consistent with the suggestion of counsel for North American which, in effect, urges us to disregard the word "substantial." We conclude, therefore, that to warrant an exception to the limitation of a holding company system to a single integrated public utility system and to satisfy the standard of clause (A), respondent must show that important economies will be lost if the holding company's control of such system is severed.

On the basis of the record before us, we cannot find that
299 "substantial economies" would be lost by the separation from the holding company relationship of any of the electric utility systems now operated by subsidiaries of North American.[19]

Cogent support for this conclusion is found in North American's stated policy. It has, according to its counsel, operated for more than 20 years on the theory that "each operating group should have a strong localized management, which was aided by the advice and counsel of the holding company, to avoid the dangers of local stagnation."

As nearly as can be determined from the record in this
300 case, North American leaves operations and operational pol-

---

[19]The retention of gas systems under the standards of clauses (A) and (C) is discussed *infra*, p. 23.

The utility properties of subsidiaries of Light & Power are, of course, part of the North American system. North American has presented no evidence or argument directed to the question whether any of these utility properties can be retained under the Act along with the Union system and since we cannot, on the basis of the record, find that such properties may be retained by North American as part of its principal system or as an additional system or systems meeting the (A), (B), (C) standards, we must order their divestment. However, our order requiring North American to divest itself of its interest in Light & Power and Light & Power's subsidiaries does not foreclose the filing of applications in the future looking to the possible integration of any of these properties with the retainable properties of North American.

301

icy to the managements of its subsidiaries. It certainly can not claim that, insofar as the day-to-day operation of a public utility business is concerned, independence of the companies in its system will cause the loss of substantial economies.

North American rests its arguments under clause (A) on other grounds. The bases for its contentions in this respect are alleged to be (a) its assistance to subsidiaries in their financing, (b) its advisory and consultative facilities, and (c) the benefits from its intercompany committees.

302

(a) *Assistance in financing*—North American's participation in and domination over financing matters of its subsidiaries has, in the past, constituted North American's most important activity in its subsidiaries' affairs. Operating heads of its subsidiaries have testified to the completeness with which North American takes over the planning and handling of securities flotations. One by one they have disclaimed the ability to build, within their own groups, talent to meet their local financial problems. They have claimed that such talent would be expensive and that it would be wasted because of the infrequency of its exercise, if limited to individual groups.

303

While we cannot accept the premise that the problems of financing independent public utility companies are too complicated and difficult for the average local management of average business capability, we are willing to make that assumption *arguendo* in testing North American's claim that it would be uneconomical for any of the sub-holding company systems to employ officers and a staff capable of handling financial problems.

In assessing this claim, the statements of North American counsel in argument before us are pertinent:

"North American's subsidiaries illustrate the tremendous growth problem and need for capital. Thus, the Wisconsin Group which had outstanding $15,764,000 in securities in 1900, rose to $55,670,000 in 1920 and more than $156,000,000 by 1940. The St. Louis Group, with a capitalization of $8,200,000 in 1904, rose to $40,878,000 in 1920 and $193,605,000 in 1940. Cleveland, when control was acquired by North American in 1922, had a total plant account of $41,200,000 which increased to $128,000,000 by 1930 and $148,200,000 in 1940."

305 The Cleveland Electric Illuminating Company has, to date, issued 34 issues of debt securities, 13 issues of preferred stock, and 29 issues of common stock. The nature and amounts of the securities of the three Wisconsin-Michigan companies have fluctuated greatly year by year. The testimony on behalf of the Union group indicates that its financing problems are also of "considerable magnitude." North American has been forced to concede the magnitude of Union's financing. It would seem, in view of the contention that where there is little financing it is not economical to maintain a financial staff, that Union should have such a
306 staff because of its volume of financing. But here it is argued, somewhat inconsistently with the argument in respect of the other groups, that the maintenance of a local financing staff for the Union group would involve considerable expense and would not, for that reason, be advisable.

We think that North American's argument is, in fact, self-defeating. The normal development of a management faced with financing problems recurring as often as they do in the utility industry would appear to be toward familiarity with the problems involved. If we accept the testimony before us, it may well be the fact that North American's

usurpation of the handling of its subsidiaries' financing problems has retarded that development in the managements of its subsidiaries.[20] But we are by no means convinced that it would be uneconomical for the subsidiary systems to maintain a personnel equipped to deal with their own local financial problems. And if it be the fact that the present managements of the system companies are incapable of holding their own in financial negotiations, independence will permit stockholders in those companies to substitute capable management.

308

Although sufficient motives for active intervention in financing by North American, other than a desire to aid and assist its subsidiaries, may exist,[21] we are not concerned with them here. We hold that it has nowhere been shown that such financing could not have been done, and done without the loss of substantial economies, without North American's participation.[22]

---

[20]The president of Potomac Electric Power Company, principal operating subsidiary of Washington Railway and Electric Company, was forced, by reason of his denial of knowledge of financial matters, to admit that he was not competent to judge the success of his company in securities flotations effected with the aid of North American 309 as compared with companies outside the system.

[21]The importance and value to a holding company of being able to dominate its subsidiaries' financing and to control the flow, through underwriting channels, of millions of dollars of securities are too obvious to need discussion.

[22]A questionable exception is the evidence bearing on the insistence of Edwin Gruhl in 1932 (while he was president of North American) that bonds to finance the Wisconsin-Michigan properties be issued to the extent of $5,000,000 over the amount then needed. It was stated that the money was used to advantage in building a generating plant at low cost during the depression and that Gruhl's action was based on "great vision."

Refundings at lower interest rates within the past few years, cited as evidence of North American's aid, have certainly not been peculiar to the North American system. It is common knowledge that public utilities, as well as industry as a whole, have been enabled to scale down interest by advantageous refundings.

The further argument has been made that severance of North American's control would deprive the subsidiary systems of an important source of financing. In support of this argument, North American's counsel has cited the testimony of a vice president of Wisconsin Electric Power Company to the effect that:

> ". . . the North American Company, over the years, has been our financial backer and as a result we have been freer to devote our major attention to other phases of the business."

311

Advances by North American to its subsidiaries are cited to reinforce the argument.

Consideration of the record in this respect leaves us in no doubt, however, that severance of the subsidiary systems from North American would not deprive them of any "substantial economies" respecting the borrowing of money. In support of the above-quoted testimony the witness cited advances by North American to Wisconsin Electric Power Company in 1920 carrying interest at 6½%. There have been no advances from North American to its subsidiaries
312 since 1935. In fact, there were substantial periods when North American borrowed from its subsidiaries for the purpose of lending money in the call-money market.[23] Thus, Union Electric Company of Missouri at one time had balances as high as $9,258,000 outstanding against North American, and in 1932, Wisconsin Electric Power Company had a balance due from North American in the amount of $3,429,000.[24] Moreover, whereas interest rates paid by subsidiaries to North American for sums borrowed during the

[23]This practice was justified as "assistance" to subsidiaries "in earning some return on that money."

[24]In 1929 this balance was $8,510,000.

period from 1915 to 1930 varied from 4½% to 8⅛%, North American paid interest to its subsidiaries at a rate generally lower than current call-money rates. We certainly cannot find that the cessation of this credit interflow would result in the loss of "substantial economies" to the subsidiary companies.

(b) *Advisory and consultative facilities*—The operating heads of various North American subsidiaries have acknowledged indebtedness to North American for the advice and consultation afforded by its staff on management problems. 314
It does appear that there has been some interchange of ideas with respect to budgeting, tax matters, major installations, and accounting matters. However, it should be noted that North American's entire operating division consists of eight persons, including three clerks, two engineers, a rate specialist, and two executives who are not engineers.

There is nothing in the record to indicate that a cessation of this advice and consultation would cause the loss of any substantial economies to subsidiary systems. North American, it is claimed, holds itself open for advice and consultation "to avoid the dangers of local stagnation." This claim 315
may be measured against the view uttered by one of North American's own witnesses:

> "In the electrical industry as a whole, I refer to the utility industry primarily, there is a great freedom of interchange of ideas, facilities and information."

We may assume that the character of the electric utility industry will not change so drastically in the future as to permit companies which have been severed from the North American system to fall into "local stagnation."

(c) *The intercompany committees*—North American subsidiaries (other than Light & Power and its subsidiaries, and Pacific Gas and Electric Company) have representation on three system committees which serve as a clearing house for technical and accounting information. The record indicates that the operation of these committees has been of some benefit to the participating companies. The same witnesses who testified to the value of the committees also testified that the committees could not survive a rupture in the affiliated status of the members. We are unable to under-
317 stand why—if the value of the committees is so patent—the self-interest of the participating companies would not compel their retention. We see no obstacle to the retention of such committees outside the North American system and we think that their dissolution would only be proof of the insubstantiality of the "economies" resulting from them. We cannot find, therefore, that by reason of the intercompany committees substantial economies will be lost by the severance of North American's control of the subsidiary systems.

3. *The Standard of Size in Section 11(b)(1)(C)*—Were
318 North American to satisfy all of the limitations in clauses (A) and (B) with respect to the electric utility systems which it claims it can keep as additional systems to the Union group under the (A), (B), and (C) clauses, retention of these systems would nevertheless not be permissible, for we cannot find that such systems meet the tests posed by clause (C).[25] A holding company cannot retain, in addition to its principal system, any other system which results in a combination of systems—

---

[25]As has been stated, no attempt has been made by North American to show that any of the various subsidiary systems of Light & Power might be retained as additional systems to the Union group under the standards of clauses (A) and (C). See footnote 19, *supra*.

". . . so large (considering the state of the art and the area or region affected) as to impair the advantages of localized management, efficient operation, or the effectiveness of regulation."

The bulk of the service area of the Union group centers around St. Louis, Missouri. Such operations as it conducts in Illinois center around East St. Louis, directly across the Mississippi River from St. Louis. The Wisconsin-Michigan properties spread from the northern boundary of the United States in the Michigan Peninsula to the southeastern part of 320
Wisconsin, where the operations center around Milwaukee. The Detroit Edison Company operates in an area radiating out of Detroit, Michigan. The Cleveland properties serve an area surrounding the City of Cleveland and containing 1,700 square miles with a population of 1,500,000.

Clause (C) enjoins us to consider the "area or region" affected in determining whether the advantages of localized management, efficient operation, or the effectiveness of regulation will be impaired. We have indicated in the *Engineers Public Service Company* case, *supra*, that the singular form of the phrase "area or region" in clause (C) is material 321
in determining what additional systems are permissible under clause (B). The fact that this phrase is in the singular is material, also, in a determination of what is meant by the term "localized management" in clause (C). The language of that clause, taken together with the legislative history exhaustively commented on in the *Engineers* case, makes it apparent that an intention is manifested to prevent retention of additional systems where such retention will result in control by the same interests of unrelated properties in widely separated areas.

322 The language of clause (C) finds an almost identical counterpart in the definition of an integrated electric utility system contained in Section 2(a)(29)(A). That definition describes a system having certain physical characteristics and which is, further—

> ". . . confined in its operations to a single area or region, in one or more States, not so large as to impair (considering the state of the art and the area or region affected) the advantages of localized management, efficient operation, and the effectiveness of regulation."

323 Similar language appearing in different sections of a statute is normally to be given the same meaning.[26] The use of this similar language in Section 2(a)(29)(A) and in clause (C) of Section 11(b)(1), in our opinion, casts considerable light on the meaning of the size standards of clause (C) and would seem to indicate that similar considerations are involved in applying the size standards of clause (C) to a combination of principal and additional systems, as are involved in applying the size standards of Section 2(a)(29)(A) to determine the maximum limits of
324 a single integrated system. However, it is not necessary in this case to decide whether the Act compels such a conclusion. Viewed in any light and standing by itself, clause (C) could not be satisfied by a combination of the Union group properties with those of the Wisconsin-Michigan, Detroit Edison, or Cleveland systems.

Milwaukee and St. Louis are 285 miles apart. Detroit and St. Louis are 415 miles apart. Cleveland and St. Louis are 424 miles apart. Each of the systems operating in the

---

[26] *United States* v. *Cooper Corporation, et al.*; 312 U. S. 600 (1941).

vicinity of these cities is a vast enterprise.[27] The operations of each center around a large city which dominates the life of the area surrounding it. Each is the focal point of a different "area or region," in a geographical, sociological, and operational sense.

We are not persuaded by North American's argument that the present local character of the management of its subsidiaries shows that a combination of the St. Louis, Wisconsin-Michigan, Detroit Edison, and Cleveland properties would satisfy the standards of clause (C).[28] As assured as we might be of the completeness of this localized management, it cannot be guaranteed that this policy of North American's management will remain unchanged or that the present management of North American will remain forever in power. Light & Power's policy with respect to localization of its subsidiaries' managements changed swiftly 326

[27]The Union group in 1939 sold 2,140,509,187 kwh to 249,096 customers in an area of 3,100 square miles. The consolidated capitalization of the Union group (including surplus) was $203,444,978 at December 31, 1940.

The Wisconsin-Michigan group in 1939 sold 1,194,464,505 kwh to 250,770 customers in an area of 8,289 square miles. At December 31, 1939 the book value of the electric properties alone of these companies was $140,315,612. 327

The property and plant account of The Detroit Edison Company, as of June 30, 1940, was $327,619,644 before deduction of reserves.

The Cleveland system in 1940 sold 1,841,085,543 kwh to 330,000 customers in an area of 1,700 square miles. As of December 31, 1940, the consolidated property and plant account of Cleveland Electric Illuminating Company was $148,223,464 before deduction of depreciation reserves, and $113,641,751 after such deduction.

[28]North American has stated that its unawareness of certain activities of persons connected with the management of the Union group (which activities have resulted in the recent conviction of Union Electric and its chief executive officer for wilful violation of Section 12(h) of the Public Utility Holding Company Act) illustrates the extent of its localization policies. If we accept this statement, it would seem to be persuasive evidence that North American's utility empire has grown too large for efficient management.

when North American assumed active control. So may North American's policy change with a changed management. We must, under the statute, look to size and the area or region affected, not to the policy of a particular management group, in making our determination.

For the reasons stated, we cannot find that a combination of either the Wisconsin-Michigan, the Detroit Edison properties, or the Cleveland system with the Union group would satisfy clause (C).

329 4. *The Retention of Gas Systems*—The contention is urged upon us here, as it was in the *Columbia Gas & Electric Corporation*[29] and *The United Gas Improvement Company*[30] cases, that gas and electric properties may be retained together as parts of a single integrated public utility system. That contention was considered and reconsidered at length in the above-mentioned cases, and rejected. No argument has been presented and no evidence has been adduced herein which would lead us to change our conclusion in this respect. On the authority of, and for the reasons discussed in, the *Columbia Gas* and *United Gas Improvement* cases, we hold that gas properties may be retained by North American only if such gas properties are part of an integrated gas utility system retainable as an "additional system" under the (A), (B), (C) standards of Section 11(b)(1).

330

Gas facilities are operated by both Wisconsin Gas and Electric Company and Wisconsin Michigan Power Company in the Wisconsin-Michigan group. Gas operations are also

---

[29] 8 S. E. C. —— (1941), Holding Company Act Release No. 2477.

[30] 9 S. E. C. —— (1941), Holding Company Act Release No. 2692.

331

conducted by The Detroit Edison Company, Pacific Gas and Electric Company, certain subsidiaries of Light & Power, and the Union group. We have determined that the electric utility systems operated by the Wisconsin-Michigan companies, The Detroit Edison Company, Cleveland Electric Illuminating Company, and Pacific Gas and Electric Company,[31] cannot be retained by North American in combination with the Union group and no attempt has been made to show that any of the electric utility systems operated by any subsidiary of Light & Power can be so retained. Since such relationships as have been shown between gas and electric operations deal with the gas and electric operations of each individual group, rather than with the gas operations of one group and the electric operations of another, there is no evidence which would permit us to find that any gas properties outside the Union group territory can be retained in combination with the Union group.

332

The gas operations in the Union group territory are conducted by Union Electric Company of Illinois, a subsidiary of Union Electric Company of Missouri, in Alton, Illinois; by Iowa Union Electric Company, also a subsidiary of Union Electric Company of Missouri, in Keokuk, Iowa; and by St. Louis County Gas Company, a direct subsidiary of North American, in an area surrounding the City of St. Louis. The gas operations of the three companies are located within the electric service territory of the Union group. Although the gas operations of the Iowa and Illinois companies are relatively small, the total assets of the St. Louis County

333

[31]Respondents' argument with respect to retention of North American's interest in The Detroit Edison Company and Pacific Gas and Electric Company as "investments" is considered *infra*, p. 28.

Gas Company amounted at May 31, 1940, to the substantial sum of $9,944,909.

We find that the gas operations of the three companies constitute those of three integrated gas utility systems. It is clear that retention of these systems in addition to the electric operations of the Union group would satisfy clause (B). More difficult questions are presented, however, under the standards of clauses (A) and (C). Evidence has been introduced to show the use of joint personnel and facilities and close operating and managerial relationships between
335 the gas and electric operations. It has been stated that the mutual performance of meter-reading, billing, engineering, maintenance and the like, as between Union of Missouri and St. Louis County Gas, alone, results in annual savings of $230,000 per annum. There is no indication of the method by which this figure has been calculated. And, more important, there is nothing in the record from which we can compare the alleged economies resulting from use of joint personnel and facilities with the possible increased economies and efficiency which might result from the independent operation of the gas systems. Such a comparison would seem
336 to be particularly pertinent to the question presented under clause (A)—whether the gas systems cannot be operated independently "without the loss of substantial economies which can be secured by the retention of control" of these systems and the electric operations of the group by the same holding company.

In many branches of consumer use, gas and electricity are natural competitors. Especially when both operations are conducted in the same territory, joint control creates the danger that one business may be suppressed in favor of the other or be made to carry the other. Economies claimed to

result from joint operations must be measured against the possibility that independence will permit unsuppressed development and growth for both types of businesses.

We are not satisfied that this record contains an adequate exploration of the relevant evidence bearing on the question whether retention of these gas systems in addition to the electric operations of Union would satisfy the standards of clauses (A) and (C). We have therefore decided not to make any findings on this matter at this time. We shall direct that the record be reopened for the purpose of receiving further evidence bearing on the permissibility under the Act of retention of the gas operations of the Union group—including those of the St. Louis County Gas Company—in addition to the electric operations of the group. To afford respondents and our staff an opportunity to prepare for the introduction of such evidence, our order setting the date for the further hearing will contain a statement of the specific matters upon which we desire to have additional evidence presented. 338

C. *The "Other Businesses" Retainable by North American*—A registered holding company is required by Section 11(b)(1) to limit its operations to a single integrated public utility system, to such additional public utility systems as meet the standards of clauses (A), (B), and (C), and to "*such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system . . .*" The section provides further that "*The Commission may permit as reasonably incidental, or economically necessary or appropriate to the operations of one or more integrated public-utility systems* 339

340 *Findings and Opinion of the Commission*

the retention of an interest in any business (other than the business of a public-utility company as such) which the Commission shall find necessary or appropriate in the public interest or for the protection of investors or consumers and not detrimental to the proper functioning of such system or systems." (Emphasis supplied.)

North American controls directly certain companies engaged in the investment, real estate, and coal businesses. The Union group, in addition to the electric operations which we have determined may be retained by North American as
341 an integrated public utility system, also conducts heating, real estate, coal, and railway businesses. It is claimed that interests in all of these businesses may be retained under the "other business" clauses of Section 11(b)(1). North American has also argued that it may retain its interests in The Detroit Edison Company and Pacific Gas and Electric Company as "investments" under these clauses.

In the course of argument respecting retention of non-utility interests, counsel for the respondents cited the *American Water Works and Electric Company* case, 2 S. E. C. 972
342 (1937), in support of his contention that we are required to make "affirmative findings . . . that North American may retain its minority utility investments and all of the other businesses controlled within the holding company system." We think it is clear that the *American Water Works* case is not authority for the retention of all of the interests for which counsel contends. We think that it is appropriate here to define in broad outline the criteria which we believe must be considered in determining whether we can permit the retention by a public utility holding company of interests in businesses other than the electric and gas utility businesses.

If it be recalled that the Commission may permit retention of an interest in a non-utility business as "reasonably incidental, or economically necessary or appropriate" to the operations of an integrated public utility system or systems, when it finds retention of such interest to be "necessary or appropriate in the public interest or for the protection of investors or consumers and not detrimental to the proper functioning" of such a system or systems; and if it be recalled that the phrase "public interest" is used in connection with the policy of curing evils which result "when the growth 344
and extension of holding companies bears no relation to economy of management and operation or the integration and coordination of related operating properties" (Section 1(b)(4)), it becomes apparent that the historical background of the joint control of a non-utility business with a utility business has little or no bearing on the permissibility of its retention in a public utility holding company system. Interests held for a long period do not, by reason of that fact alone, achieve any relation to "economy of management and operation" or "the integration and coordination of related operating properties." Indeed, it is the very purpose 345
of Section 11(b)(1), to require the severance of those interests acquired in the course of the historical "growth and extension" of a holding company which do not satisfy the policy of the Act.

By the same token, the "substantiality and stability of income" afforded by non-utility interests is not, in and of itself, a factor warranting their retention in a public utility holding company system. Substantial and stable income might be afforded by businesses having no imaginable relationship to the economy of management and operation of integrated public utility systems. If the "other business" clauses of Section 11(b)(1) are not to be removed from

their statutory context, and if we are to give full weight to the express standards and the policy of the Act, we cannot find that any business is "reasonably incidental, or economically necessary or appropriate" to the operations of an integrated public utility system or is "not detrimental to the proper functioning" of such a system merely because it is profitable.

The same considerations apply to economies resulting from joint use of personnel. Unless the non-utility business
347 is such that resulting economies are *economies in the operation of an integrated utility system or systems,* the mere showing of economies is of little weight in determining whether the non-utility business may be retained.

With respect to many of the non-utility properties involved in this proceeding, the claim has been made—apparently as an argument in favor of permitting retention—that great difficulty would be faced and losses would be sustained in disposing of such properties in compliance with a divestment order. The difficulty of disposing of an interest frequently results from the inability to find interested pur-
348 chasers at a price which is equal to or more than the value at which such interest is carried on the books. Realistically, the sale of such properties does not always mean that a loss has been *sustained* at the time of the sale, but rather that it may have to be recognized at that time. Where it is clear that there is no market at any reasonable price and where disposition by any other method than sale is not feasible, a company which has been ordered to dispose of various interests may, under Section 11(c), request an extension of time for compliance with divestment orders.

With respect to certain non-utility interests, respondents have argued that they need show no affirmative public benefit resulting from the retention of such interests, and they have

argued, further, that we need find merely that retention of such interests is "compatible with the public interest."

To make the statutory finding which it is conceded we must make to permit retention of a non-utility interest requires, in our opinion, more than a showing that no positive harm will result from the retention. What do the phrases "public interest" and "proper functioning" of an integrated system in their context in Section 11(b)(1) mean? It is our view that they refer to the stated policy of the Act to limit the activities of public utility systems to activities related "to economy of management and operation" of the *public utility* system, and the "integration and coordination of related operating properties."[32] Compatibility with that interest, even if that is all that need be shown, requires a showing that the public interest will be furthered by retention of a non-utility interest by reason of its relation "to economy of management and operation" of a public utility system or systems or "the integration and coordination of related operating properties."[33] We cannot make the *affirmative* statutory

350

---

[32]See Section 1(b)(4).

[33]Compare *United States* v. *Lowden*, 308 U. S. 225 (1939), where the Supreme Court was called upon to construe the phrase "public interest" as it appears in Section 5(a)(4) of the Transportation Act of 1920. In reviewing a determination of the Interstate Commerce Commission upon an application for approval of a consolidation of railroad companies, the Court said (308 U. S. at 230): 351

> "In *New York Central Securities Co.* v. *C. C. C. & St. L. Ry. Co.*, 287 U. S. 12, we pointed out that the phrase 'public interest' in this section does not refer generally to matters of public concern apart from the public interest in the maintenance of an adequate rail transportation system; *that it is used in a more restricted sense defined by reference to the purposes of the Transportation Act of 1920, of which the section is a part and which, as had been recognized in earlier opinions of this Court, sought through the exercise of the new authority given to the Commission to secure a more adequate and efficient transportation system.*" (Emphasis added.)

findings necessary to permit retention unless the record contains such a showing.

In the course of this opinion the standards of the "other business" clauses will be applied to many non-utility businesses in the North American system. We have not thought it necessary to repeat the foregoing discussion in connection with each such interest, since our comments here are intended to apply generally.

353 1. *North American's Interests in The Detroit Edison Company and Pacific Gas and Electric Company*—At the time these proceedings were instituted, applications were pending with respect to both The Detroit Edison Company and Pacific Gas and Electric Company for orders under Section 2(a)(8) of the Act declaring such companies not to be subsidiaries of North American. North American has argued that its interests in these companies represent merely "investments" and that their retention should be determined under the "other business" clauses of Section 11(b)(1).

354 However, on August 5, 1940, and September 10, 1941, respectively, we issued our findings and orders denying both of the applications under Section 2(a)(8).[34] It is clear, therefore, that both companies are subsidiaries of North American under the Act and must be regarded as such in this proceeding. Since subsidiary utility companies may be retained in a public utility holding company system *only* where such subsidiary utility companies constitute part of the "single" or any additional integrated system or systems

[34] *The Detroit Edison Company*, 7 S. E. C. 968; *Pacific Gas and Electric Company*, 9 S. E. C. , Holding Company Act Release No. 2988.

retainable by the holding company under Section 11(b)(1) (*The United Gas Improvement Company, et al.*, 9 S. E. C. (1941), Holding Company Act Release No. 2692, at p. 11), and since, for the reasons already stated, neither Detroit Edison nor Pacific Gas and Electric Company is part of the single integrated system or any additional integrated system which may be retained by North American, North American must divest itself of its interests in these companies.[35]

2. *North American's Direct Non-Utility Subsidiaries.* 356

(a) *North American Utility Securities Corporation*—This company was organized under the laws of Maryland in 1924 as a medium for the investment of North American's surplus funds. The company has not been active for some time. Its investment portfolio (consisting of securities whose market value as of December 31, 1940, was $4,667,-

[35]Petitions for review of our orders denying the Section 2(a)(8) applications were filed by Detroit Edison and Pacific Gas and Electric Company. Our order in the former case was sustained by the Circuit Court of Appeals for the Sixth Circuit (*The Detroit Edison Company* v. *Securities and Exchange Commission*, 119 F. (2d) 730 (1941)), and a petition for certiorari was denied by the Supreme Court (62 S. Ct. 105 (1941)). The petition for review in the *Pacific Gas and Electric Company* case is now pending in the Circuit Court of Appeals for the Ninth Circuit. Against the possibility that our order in that case may be reversed on judicial review and that Pacific Gas and Electric may be found not to be a subsidiary of North American, we have thought it appropriate to give respondents the full benefit of our views and consider whether North American might be permitted to retain its interest in Pacific Gas and Electric Company on the theory that such interest constituted a mere investment in a non-subsidiary utility company. We have concluded, however, that even if North American's interest in Pacific Gas and Electric Company were so to be treated, we could not find it retainable under Section 11(b)(1). 357

865)[36] yielded, in 1940, a net return of $279,190. All of the outstanding preferred stock of the company, and 80.6% of the common, is held by North American. As of December 31, 1940, there were dividend arrears on the preferred stock amounting to $25 per share, and there was apparently no equity for the common stock.

The only argument made for retention of the interest of North American in North American Utility Securities Corporation is that it "contributes diversity to the North American system and in no way interferes with the operations of
359 the utility subsidiaries of North American." On that narrow ground North American requests us to find that retention of the interest may be permitted under the "other business" clauses of Section 11(b)(1).

The extent to which diversity was sought in this venture may be tested by noting that one-third of North American Utility's assets consists of stock in a company (Pacific Gas and Electric Company) in which North American's direct and indirect investment is substantial enough to create a statutory parent-subsidiary relationship, and that
360 43.14% of North American Utility's assets consists of utility investments. Moreover, the mere fact that an investment offers "diversity" affords no justification for its retention by a public utility holding company under the "other business" clauses of Section 11(b)(1). A contrary conclusion

---

[36] Based on market values, its portfolio was distributed as follows:

Railroad common stock	3.37%
Utility common stock (including 56,900 shares of Pacific Gas and Electric Company common stock, representing approximately ⅓ of total assets)	42.04%
Utility preferred stock	1.10%
Industrial common stock	52.33%
Industrial preferred stock	1.16%

would require the Commission to permit public utility holding companies to operate any type of business, however remote its relationship to the utility business. As we have already pointed out, the standards of the "other business" clauses do not exist in a vacuum, but can be considered only in relation to the operations of public utility systems. The argument that mere diversity of investment justifies the retention by a holding company of an unlimited number of varied interests was presented at length to Congress at the time this legislation was under consideration. In 362
enacting the statute and particularly in enacting Section 11(b)(1), Congress indicated clearly its rejection of this argument.[37] We cannot make the findings necessary under Section 11(b)(1) to permit the retention of North American's holdings in North American Utilities Securities Corporation, and we must therefore order North American to divest itself of these holdings.[38]

(b) *60 Broadway Building Corporation*—This corporation, all of whose stock is owned by North American, was

---

[37]"Diversification of risks is a matter of investment judgment to be undertaken by the individual investor or an investment trust, not 363
by those actually controlling and managing operating companies." Report of Senate Committee on Interstate Commerce on S. 2796, p. 12, Report No. 621, 74th Cong., 1st Sess.

In discussing the argument based on geographic diversification of utility properties, the Senate Report states:

> "Even if the argument of diversification were sound, it is outweighed by the political and general economic desirability of breaking up concentrations of financial power in the utility field too big to be effectively regulated in the interest of either the consumer or the investor, and too big to permit the function of democratic institutions." (*Id.*, p. 12.)

[38]It is clear, of course, that whatever our finding as to North American Utility Securities Corporation itself, it could not be used by North American as a vehicle for indirect ownership of stock of Pacific Gas and Electric Corporation which, as we have already held, cannot be retained in the North American system.

364 formed under the laws of New York in 1924. It owns a 25-floor building at the address indicated in its name, in the financial district of New York. Only two floors and part of three others are occupied by North American. The remainder of the building is leased to various unaffiliated tenants.

As of December 31, 1940, 60 Broadway Building Corporation had assets of $4,869,879, outstanding liabilities represented by a mortgage of $1,918,750 and open account indebtedness to North American of $1,659,023, and common stock
365 in the amount of $100,000.

The building owned by this company was acquired by North American for investment purposes and, it is claimed, as a "hedge" against rising rents. During the period between 1928 to 1934, North American paid rent to the corporation at about half the rates charged to other tenants and, in addition, during the years 1928 to 1933, received dividends on its investment. The corporation's net income in 1940, before interest on the open account indebtedness, was $49,293.

366 If it were clear that North American's holdings in this company represented merely an indirect ownership of appropriate office facilities, we should have no difficulty in holding that the interest could be retained under the Act. However, when we consider the location and type of building owned by 60 Broadway Building Corporation and the fact that North American occupies only two floors and a portion of three others, out of the 25 floors in the building, there would seem to be some question whether ownership of this building is not more than ownership of appropriate office space. The record is not sufficiently complete on this point and we think it unnecessary to decide the question at this time. It seems clear that when the North American system com-

367

plies with Section 11(b)(1), the needs of North American in respect of office space will be very much altered. Accordingly, we have decided to reserve this question for further consideration in the light of the future needs of North American in this respect.

(c) *West Kentucky Coal Company of New Jersey*—This company, which was formed in New Jersey in 1905, is engaged, directly and through subsidiaries, in mining coal in Kentucky. It has been stated that the company was organized to serve as a source of coal supply to the St. Louis

368

operations but that, since this was found to be impracticable, the company's output has been sold almost exclusively to non-affiliated purchasers. As of December 31, 1940, the total book value of the company's assets on a consolidated basis was $16,274,885. North American holds all of its common stock and over 115,656 shares of a total of 120,000 shares of its preferred. In addition, there is a large open account indebtedness running from the coal company to North American. As of December 31, 1940, North American carried its investment in the stock of this company at $3,801,351. The company's net income for 1940 (before preferred stock divi-

369

dend requirements) was $42,837.

The only argument advanced in support of the retention of this interest is that the mines operated by the company would afford a source of supply for the Union operations if other sources were closed off. There is no evidence that this contingency has occurred in the 35 years of the coal company's existence. Moreover, federal regulation of coal prices, the power to make priority orders, and the extent of labor organization indicate that contingencies affecting any source of supply of coal usable for electric generation may well affect other similar sources.

370 As we indicate below, in our discussion of the Union Colliery Company, there may be instances in which we can find that ownership of the source of a system's requirements of a vital necessity for utility operations is "reasonably incidental, or economically necessary or appropriate" to the operations of an integrated electric utility system under Section 11(b)(1). However, as has been noted, the output of West Kentucky Coal Company is not used by North American but is sold almost exclusively to non-affiliated purchasers. It is clear, therefore, that North American's
371 holdings in the company do not represent ownership of a vital commodity used in the operations of the public utility system but that they represent merely an investment in a business which bears no relation whatever to the system's permissible utility operations.

Accordingly, we cannot find that retention by North American of West Kentucky Coal Company of New Jersey and its subsidiaries is permissible under Section 11(b)(1).

3. "Other Businesses" of the Union Group.

372 (a) *Steam heating business*—Union Electric Company of Missouri, top company in the Union group, provides steam heat in St. Louis from boilers located in the so-called Ashley Street steam generating station. A total of 414 customers are thus served, and, in 1939, $750,510 of revenue was derived from that business.

The evidence indicates joint use of facilities and personnel in the steam and electric operations. It has also been shown that the joint operations of the steam and electric facilities are closely related. During summer, hydro-electric production must be backed by steam generation because of low water conditions. At the same time the heating peak is low. When the hydro capacity goes up in winter and requires

less steam generation backing, boilers may nevertheless be kept in continuous operation to supply the additional heat. On the basis of the record before us, we find that this steam heating business is reasonably incidental and economically necessary or appropriate to the operations of the electric utility system and that it may be retained under Section 11(b)(1).

(b) *Union Colliery Company*—This company is a direct subsidiary of Union Electric Company of Illinois,[39] which holds all of its outstanding securities. It operates a mine 374
at Dowell, Illinois, about 85 miles southeast of St. Louis. For the year ended June 1940, it produced 1,260,000 salable tons of coal, of which 1,010,000 were sold to the Union group for use in its electric utility operations. This represents most of the coal used by the Union group. Union Colliery's property account, as of September 30, 1940, amounted to $2,375,000. It had a net income in 1939 of $61,408.

North American claims that ownership of this mine represents ownership of a commodity vital to the electric operations of the Union group and affords a continuous supply of coal to the group. It is stated that this continuous supply 375
is particularly important because of the wide variations at different periods in the group's need for coal.[40]

---

[39]Union Electric Company of Illinois is in turn a subsidiary of Union Electric Company of Missouri. It owns generating plants in Illinois at Cahokia and Venice, adjacent to St. Louis, and serves he East St. Louis, Illinois, territory with electricity.

[40]The Union group uses steam and hydro-electric generators. Of a total name plate generating capacity of the Union group of 722,500 kw, 237,000 kw are hydro capacity, afforded by generators at Osage, Missouri, and Keokuk, Iowa. The generating policy of the Union group is to supply hydro power to the highest available extent, and thereafter to run steam stations to supply additional loads in the order of their efficiencies. The seasonal variations in available hydro power result in variations in the use of steam generators, and consequent variations in the consumption of coal.

376 *Findings and Opinion of the Commission*

The distinctions between the problems presented with respect to retention of the Union Colliery Company and the West Kentucky Coal Company (see p. 31, *supra*) are, in our opinion, sufficient to warrant different conclusions. First, although West Kentucky sells very little of its coal to the Union group, over 80 percent of the entire output of the Colliery mines is actually used by the Union group for generating operation. Second, the Colliery Company's mines, which are located close to the utility operations of the system, have been demonstrated by experience to be a convenient and
377 economical source of a commodity vital to the system's electric utility operations. Third, the economies shown to result from joint operation of the Colliery Company and the Union group[41] have been clearly shown to be related to the economic and efficient management of the electric utility system. Fourth, the Colliery Company is wholly owned by Union and appears to be operated as a mere department of the Union group.

For these reasons, we cannot agree with the contention of counsel for the Public Utilities Division that this interest cannot be retained in the system. We find the business of
378 the Union Colliery Company to be reasonably incidental, or economically necessary or appropriate to the electric utility operations of the Union group and hold that it is retainable by the Union group and North American.

(c) *Union Electric Land and Development Company*— This company, a direct subsidiary of Union Electric Company of Missouri, was formed in 1929 to acquire land needed for the development of a hydro-electric plant at the Lake of

[41] *E.g.*, performance of electrical engineering for the Colliery Company by Union group engineers, use of joint office and automotive facilities and personnel.

the Ozarks. The land is no longer desired for that purpose, and the company is at present engaged in a program of liquidating its holdings, which, as of September 30, 1940, were valued at $1,940,000. Although we have been requested by counsel for the Public Utilities Division to find that this business is reasonably incidental, or economically necessary or appropriate to the operations of the integrated public utility system of the Union group, we cannot do so. There is no evidence in the record to justify a finding that the business of the company is retainable under Section 11(b)(1). Indeed, the fact that a voluntary program for 380
liquidation of the company's holdings has been undertaken is some evidence that respondents do not regard the business as economically necessary or appropriate. Should time beyond a year be necessary for liquidation, respondents may apply, under Section 11(c), for an appropriate extension.

(d) *Union group transportation business*—The St. Louis and Belleville Electric Railway Company, a wholly-owned subsidiary of Union Electric Company of Missouri, owns and operates a freight line 11 miles long, on a single track from Belleville, Illinois, to East St. Louis, Illinois. Its 381
investment in railroad property amounts to about $1,300,000. It employs about 60 men. It owns an aggregate of 450 coal cars, many of which it leases to other roads.

The road has had an average net income of $56,000 per annum for the years 1930-1940. It did not, at any time during this period, operate at a loss.

Respondents have argued that the railroad is related to the utility operations of the group in the following respects:

1. Coal is the road's principal cargo, and it moves a large portion of the coal consumed by the group; this

business amounted to about 88% of all the coal hauled by the road between 1935 and 1940;[42]

2. Purchasing, certain warehousing, accounting, recording, property valuation, and tax matters are centrally handled for the railway company, as for other companies in the Union group;

3. The railroad purchases current used in its operations from Union Electric Company of Illinois.

383 Respondents contend that ownership of the road is of great advantage to Union's utility operations and that its retention should be permitted on the ground that such retention provides an assurance against car-shortage—a dire contingency for coal consumers which occurred during the first World War.

We cannot agree with the latter contention. As common carriers, railways have the duty of offering service to all who will pay for it. The jurisdiction of the Interstate Commerce Commission to control the supply of cars,[43] the possibility of car rationing, and priorities and allocation orders by
384 agencies of the government to meet critical transportation needs, make it unlikely that ownership of the road will result in any material advantage, or that non-ownership will cause any material disadvantage in the event of car shortage.

We have, however, permitted, as reasonably incidental and economically necessary or appropriate to North Amer-

---

[42]The record does not indicate the precise extent of other business done by the road for unaffiliated interests.

[43]Transportation Act of 1920; see Sections 1(1), (11), (12), (13), (14), and (15). See Monograph No. 11 of the Attorney General's Committee on Administrative Procedure (Sen. Doc. No. 10, 77th Cong., 1st Sess.), pp. 63-65.

ican's utility operations, the retention of the coal mines of Union Colliery Company. It appears that the St. Louis and Belleville Railway is merely a single-track freight line 11 miles long used primarily for the transportation of coal coming from the Union Colliery mines to the Union group. Under the circumstances and having particular regard to the size, location, and use of the road, we find it to be reasonably incidental and economically necessary or appropriate to the electric operations of the Union group, and we hold that it may be retained in the North American system. We think it appropriate to indicate that our finding in this respect 386 approaches what we believe to be the limits of vertical ownership permitted under the Act. And if it should appear in the future that the railroad no longer bears the same relation to the utility operations of the Union group, it might well be necessary to require its divestment from the North American and Union Electric systems.

(e) *Dormant companies*—East St. Louis & Suburban Railway Company and East St. Louis Railway Company, both subsidiaries of Union of Missouri, are completely dormant. It is claimed that these companies are kept alive 387 because of the pendency of litigation arising out of suits commenced while the companies still had assets. No attempt has been made to show that retention of these companies by North American or Union Electric of Missouri would meet the standards of the "other business" clauses of Section 11(b)(1). Disposition of Union of Missouri's holdings in these companies must be ordered.

4. *"Other Businesses" of the North American System*—Many of the other subsidiary holding companies and public utility companies controlled by North American own non-

utility assets or securities of non-utility companies and engage in non-utility businesses. Many of these non-utility businesses are discussed in the course of this opinion. We have not, however, thought it necessary to consider in any detail the non-utility businesses conducted by the Wisconsin-Michigan group, Cleveland Electric Illuminating Company, The Detroit Edison Company, or Pacific Gas and Electric Company. Such evidence as exists in the record with respect to the non-utility businesses of these companies or their subsidiaries indicates no relationship whatever between such
389 business and the utility operations of the Union group. The only relationships shown have been with respect to the operation of the above-named companies. Since we cannot find that there is any relationship between these non-utility businesses and the utility operations of the Union group, we must hold that they cannot be retained by North American under the "other business" clauses of Section 11(b)(1).

Conclusions with Respect to the North American System—In accordance with the foregoing, our order will require North American to divest itself of all of its holdings of
390 securities, direct and indirect, except the securities of Union Electric Company of Missouri, Union Electric Company of Illinois, Mississippi River Power Company, Iowa Union Electric Company, Cupples Station Light, Heat and Power Company, and St. Louis County Gas Company (whose electric operations we have found to constitute North American's principal integrated utility system and whose gas operations we have reserved for further consideration), those of Union Colliery Company and St. Louis and Belleville Electric Railway Company (whose businesses we have found to be reasonably incidental, or economically necessary or appropriate to the retainable utility operations of the North American sys-

391

tem), and those of 60 Broadway Building Corporation (which we have reserved for future consideration).

As we have indicated, we have determined to afford North American a further opportunity to present argument with respect to the choice of its principal system. Accordingly, we shall provide that our order, insofar as it requires divestment by North American, shall be subject to modification if a request is made for opportunity to present further evidence or argument in this respect, and if such further evidence or argument warrants modification.

392

We proceed to consider the application of Section 11(b)(1) to the sub-holding company respondents.

II. The Holding Company System of Union Electric Company of Missouri

Our discussion with respect to the North American system includes our views on the application of Section 11(b)(1) to Union Electric Company of Missouri as a registered public utility holding company. In accordance with the views there expressed, Union Electric Company of Missouri will be permitted to retain the electric properties of the Union group, which we have found constitute an integrated electric utility system, and—subject to our further consideration of their retainability under the Act—the gas properties of Union Electric Company of Illinois and Iowa Union Electric Company. Union Electric of Missouri will also be permitted to retain its steam heating business and the interests in Union Colliery Company and St. Louis and Belleville Electric Railway Company, which we have found may be retained under the "other business" clauses. Union Electric will be directed to divest itself of its holdings in Union Electric Land and Development Company, East St. Louis & Suburban Railway Company, and East St. Louis Railway Company.

393

III. The Holding Company System of Washington Railway and Electric Company

Washington Railway and Electric Company (Washington Railway), a direct subsidiary of North American and a registered holding company, has the following direct and indirect subsidiaries: Potomac Electric Power Company (PEPCO), Great Falls Power Company, The Washington and Rockville Railway Company of Montgomery County (Washington and Rockville), Braddock Light & Power Com-
395 pany Incorporated (Braddock), Capital Transit Company, Montgomery Bus Lines, Incorporated, and The Glen Echo Park Company.

Washington and Rockville, itself a registered holding company, holds all the stock of Braddock and 33.32% of the stock of Great Falls Power Company. Capital Transit Company holds all the securities of Montgomery Bus Lines, Incorporated, and of The Glen Echo Park Company.

The operations of the system controlled by Washington Railway consist of electric operations conducted in the District of Columbia and adjacent portions of Virginia and
396 Maryland, a transportation business conducted in the District and adjacent portions of Maryland, the ownership of certain real estate bordering on the Potomac River, and the operation of an amusement park in Maryland.

PEPCO and Braddock conduct the electric operations of the group. The real estate operations are conducted by Great Falls Power Company; the transportation operations by Capital Transit Company and Montgomery Bus Lines, Inc. The amusement park is owned by The Glen Echo Park Company.

A. *The Principal System*—PEPCO owns an interconnected system of generating transmission, and distribution

facilities in the District of Columbia. Although Braddock is maintained as a separate corporate entity, its territory is contiguous to PEPCO's and it receives all its power from PEPCO sources through interconnections therewith. We find that the utility operations conducted by PEPCO and Braddock together constitute those of a single integrated electric utility system and that these companies are retainable as such by Washington Railway. Since these are the only utility operations of the system, the only other issues to be disposed of with respect to this system are those arising 398 under the "other business" clauses of Section 11(b)(1).

B. *The "Other Businesses" Retainable by Washington Railway.*

1. *Great Falls Power Company*—This company holds title to about 1,050 acres of land bordering the Potomac River. All of its securities are held within the Washington group, 66.68% by Washington Railway, and the remainder by Washington and Rockville. The assets of the company are carried on its books at about $510,000. Camp sites have been erected on the property, and their operation has enabled the 399 company to meet taxes.

Respondents have expressed the opinion that sale of this real estate should be withheld until a "more favorable" market has developed. But, as we have pointed out, considerations of this sort relate only to the time at which compliance with a divestment order should be enforced and have no pertinency to the question whether retention of the real estate is permissible under the Act. Respondents make the further argument that a certain Joint Resolution of Congress permits the retention of this company free of any order of this Commission. For the reasons hereinafter set forth in

400 *Findings and Opinion of the Commission*

our discussion of this question in connection with Capital Transit, we believe that this argument does not override the express mandate of Section 11(b)(1) and is no bar to an order of divestment. Neither claim has any bearing on whether the business of this company is reasonably incidental, or economically necessary or appropriate to the operations of the single integrated public utility system controlled by Washington Railway. We think it is clear that such a real estate investment does not meet the standards of the "other business" clauses of Section 11(b)(1) and that it
401 cannot be retained by Washington Railway or Washington and Rockville.

2. *Capital Transit Company and Its Subsidiaries*—As of December 31, 1940, Capital Transit's capitalization was:

Funded Debt (including maturities payable within one year)	$15,490,869
Capital Stock, 240,000 shs. of $100 par	24,000,000
Capital Surplus	1,715,839
Earned Surplus	2,890,375
Debt Retirement Reserve (Appropriated Surplus)	300,410
402 Total	$44,397,493

During 1940 the gross income of Capital Transit Company was $1,878,364, and its net income carried to surplus, $872,081. Fifty percent of the stock of Capital Transit is owned by Washington Railway and in 1940 was carried on its books at $19,833,441.

Capital Transit does practically all of the buss and trolley business in the District of Columbia and the adjacent portions of Maryland which it serves. It owns 621 miles of

track, 665 street cars, 80 miscellaneous cars, and 666 busses. It employs 3,709 people and its payroll for the year 1939 was $6,099,684.

In support of their contention that these properties may be retained, respondents point to the long historical association between the electric and transportation properties of the system. Washington Railway was, in 1899, put under the control of Washington Traction and Electric Company in conjunction with several electric companies whose assets Washington Railway later purchased. In 1902 PEPCO acquired these electric utility assets from Washington Railway. 404
In the course of a unification of traction properties in the District, Capital Transit Company in 1933 took over the traction properties controlled by Washington Railway in exchange for its own stock, which stock was acquired by Washington Railway pursuant to a Joint Resolution of Congress.

There is evidence of some joint ownership of electric facilities by PEPCO and Capital Transit Company, and use by PEPCO of facilities owned by Capital Transit and by Capital Transit of certain of PEPCO's facilities. In addi- 405
tion, where equipment owned by Capital Transit Company is situated on property owned by PEPCO, PEPCO's operating force cares for it. There is, however, only one employee of either company who is paid by both.

Montgomery Bus Lines, Incorporated, a subsidiary of Capital Transit, operates a bus line from the District into Rockville and Gaithersburg, Maryland. All of its equipment is rented from Capital Transit Company.

The Glen Echo Park Company, another subsidiary of Capital Transit, operates an amusement park in Maryland, not far from the District. It is claimed that this business

serves to increase traffic on Capital Transit Company lines, and that it is remunerative.

Counsel for North American have argued not only that this vast enterprise, itself a highly complex and individuated business, is "reasonably incidental, or economically necessary or appropriate" to the operations of the single integrated electric utility system of PEPCO and Braddock, but that, in any event, it is beyond our power to order a divestment of Washington Railway's interest in this business.

407 The latter argument is based on the above-mentioned Joint Resolution of Congress of January 14, 1933, which provided (47 Stat. 752):

> "That the Washington Railway and Electric Company is hereby authorized and empowered to retain and hold stocks and bonds as provided in said unification agreement . . ."

As noted above, this Resolution related, *inter alia*, to Washington Railway's acquisition in 1933 of the Capital Transit stock. Respondents assert that it is "a fundamental principle of statutory construction that *general* provisions in a later 408 statute will not be deemed to repeal the *specific* provisions of an earlier statute," and that, therefore, no mandate of the Public Utility Holding Company Act of 1935 can be construed to require divestment of these holdings. It is urged, further, that it "may be assumed" that in passing the Joint Resolution of 1933, "Congress had in mind" the general criteria later to be laid down in Section 11(b)(1) of the Public Utility Holding Company Act.

We are not persuaded by this reasoning. Its weakness is illustrated by the very quotations from decided cases given in counsel's brief. Thus, *Rodgers* v. *United States*, 185 U. S. 83, 87-88 (1902) is cited for the proposition that:

". . . the fact that the one [act] is special and the other is general creates a presumption that the special is to be considered as remaining an exception to the general, and the general will not be understood as repealing the special, unless a repeal is expressly named, *or unless the provisions of the general are manifestly inconsistent with those of the special.*"[44] (Emphasis supplied.)

We think it is clear that the two Acts are manifestly inconsistent, within the meaning of the rule laid down in the *Rodgers* case. The Joint Resolution was addressed to a specific situation presented to Congress by private parties to 410
facilitate private action by a corporation subject to the power of Congress. But the declaration of Congress in 1935, that a public utility holding company system must be limited to a single integrated public utility system, permissible additional systems, and such businesses as are reasonably incidental or economically necessary or appropriate thereto, is clearly a sufficient warrant to us to order compliance by Washington Railway with the mandate of Section 11(b)(1).

"No principle is better settled than that a special charter to any corporation to engage in a business of a 411
public or quasi public nature cannot be set up as exempting the institution from that regulation by the state in the exercise of its police power which the public necessity demands." *Citizens Bank & Trust Co.* v. *Mabry*, 102 Fla. 1084, 136 So. 714, 716 (1931).

See, too, *Texas and New Orleans R. R. Co.* v. *Miller*, 221 U. S. 408 (1911); *State ex rel. Davis* v. *Knight*, 98 Fla. 891, 124 So. 461 (1929); *Kentucky Power & Light Co.* v. *City of Maysville*, 36 F. (2d) 816 (E. D. Ky. 1929); and *cf. Hammond Packing Company* v. *Arkansas*, 212 U. S. 322 (1909).

---

[44]See, too, *Washington* v. *Miller*, 235 U. S. 422, 428 (1914).

We have set forth at length, heretofore, our views as to the meaning of the "other business" clauses of Section 11(b)(1). Nothing presented to us respecting retention of Capital Transit Company or its subsidiaries has convinced us that we can find, in accordance with those views, that the retention of such transportation properties and amusement park is reasonably incidental, or economically necessary or appropriate to the operations of the integrated electric system of PEPCO and Braddock under the standards of Section 11(b)(1). Indeed, we think that one of the clearest Con-
413 gressional objectives, in enacting Section 11(b)(1), was to require that public utility holding company systems divest themselves of huge investments in unrelated fields such as the vast and complex transportation business of Capital Transit and the amusement park of The Glen Echo Park Company.

Washington Railway and Electric Company will be required to limit its operations in accordance with the foregoing. Accordingly, it will be directed to dispose of all interests, direct and indirect, in Great Falls Power Company and Capital Transit Company and its subsidiaries.
414

IV. The Holding Company System of Washington and Rockville Railway Company of Montgomery County

As we have indicated in our discussion respecting Washington Railway, Washington and Rockville will be required to divest itself of its holdings in Great Falls Power Company. Since the holding of Braddock and Great Falls Power stock constitutes the only business of Washington and Rockville, and since we have found that the properties of Braddock constitute part of an integrated utility system retainable by

Washington Railway and by Washington and Rockville, this is the only action necessary for Washington and Rockville to comply, as a registered holding company, with Section 11(b)(1).

North American Light & Power Company

As previously noted, we have ordered the dissolution of Light & Power pursuant to Section 11(b)(2) of the Act. 10 S. E. C. —— (1941), Holding Company Act Release No. 3233. We assume that Light & Power will be dissolved in 416
accordance with our order and that there will no longer be a holding company system headed by Light & Power. Under the circumstances, we find it unnecessary to consider the requirements of Section 11(b)(1) as they affect the Light & Power system. However, the dissolution of Light & Power will not, in and of itself, avoid the necessity for applying the mandate of Section 11(b)(1) to the holding company systems headed by subsidiaries of Light & Power which are themselves registered holding companies. These sub-holding company systems are headed by Northern Natural Gas Company and Illinois Traction Company (both of which are 417
direct subsidiaries of Light & Power), Illinois Iowa Power Company (a subsidiary of Illinois Traction), and Des Moines Electric Light Company (a subsidiary of Illinois Iowa Power Company).

V. The Holding Company System of Northern Natural Gas Company

Northern Natural Gas Company is a Delaware corporation, organized in 1930, with offices at Omaha, Nebraska. At the time this record was closed, 35% of its common stock

was held by Light & Power, 35% by United Light and Railways Company, a subsidiary of United Light and Power Company, and 30% by Lone Star Gas Corporation.[45] Northern is itself an operating company as well as a registered holding company. It owns transmission lines and sells natural gas at wholesale for redistribution and for industrial use. Its transmission lines, which constitute the major portion of its assets, tap fields in Texas and Kansas and run for a distance of 2,783 miles through Oklahoma, Kansas, Nebraska, South Dakota, Iowa, and Minnesota.
419 Northern is not a "gas utility company" as that term is defined in Section 2(a)(4) of the Act.[46]

Northern owns all of the common stock of its two subsidiaries, Peoples Natural Gas Company and Argus Natural Gas Company. Peoples and Argus maintain facilities for the sale of natural gas at retail and are gas utility companies within the meaning of the Act.

Peoples sells natural gas at retail in 66 cities and towns in 3 separate areas located in eastern Nebraska, central Iowa, and southern Minnesota (which latter area laps over into

420

[45] Since the close of the record in this proceeding, applications have been filed for approval of a reclassification of Northern Natural Gas Company's stock preliminary to a proposed public offering of the holdings of North American Light & Power in that company (File No. 70-286) and for approval of such an offering (File No. 70-302). The former application has been approved. *Northern Natural Gas Company, et al.*, 9 S. E.C. —— (1941), Holding Company Act Release No. 2815. The proceeding in respect of the latter application is still pending.

[46] Section 2(a)(4) provides, in part:

> "'Gas Utility company' means any company which owns or operates facilities used for the distribution at retail (other than distribution only in enclosed portable containers, or distribution to tenants or employees of the company operating such facilities for their own use and not for resale) of natural or manufactured gas for heat, light, or power."

421

Northern Iowa). In 1940 Peoples served a total of 19,513 customers with over 3,500,000 mcf. of gas. All of Peoples' gas supply is derived from its parent, Northern.

Argus' properties are located in southwestern Kansas. It sells natural gas in 15 communities and 7 counties in that part of the State, and in 1940 served 5,575 gas customers to whom 2,337,860 mcf. were sold. Argus owns about 200 miles of gas transmission lines and distribution systems connected thereto. It purchases its gas requirements principally from non-associated producers in the Kansas Hugoton field and to a small extent from its parent, Northern.

422

Northern, Peoples, and Argus, taken together, serve areas aggregating 25,000 square miles, containing a population of 850,000 persons. On a consolidated basis, as of December 31, 1940, the group had fixed assets carried on the books at $55,384,707,[47] and total operating revenues for 1940 of $12,857,002. During 1940, the group sold 55,873,808,000 cubic feet of gas.

Counsel for Light & Power have requested us to find that the operations of Northern, Peoples, and Argus constitute those of a single integrated gas utility system. Such a finding cannot be made under the statute.

423

Section 2(a)(29)(B) defines an integrated gas utility system as one—

> "consisting of one or more gas utility companies which are so located and related that substantial economies may be effectuated by being operated as a single coordinated system confined in its operations to a single area or region, in one or more States, not so large as to impair (considering the state of the art and the area or region affected) the advantages of localized management, effici-

[47] Of this total, Northern's fixed assets were carried at $49,753,568, Peoples' at $2,835,241, and Argus' at $2,598,858.

ent operation, and the effectiveness of regulation: *Provided,* That gas utility companies deriving natural gas from a common source of supply may be deemed to be included in a single area or region."

As has been noted, Argus purchases almost all of its gas from non-affiliated sources, while Peoples acquires its gas from Northern. The operations of the Argus properties have a much less important relationship to those of Northern than do the operations of Peoples. Moreover, there are
425 important differences in their methods of operation. From the evidence in the record we cannot find that there are substantial economies, or indeed any economies, resulting to Argus from joint ownership and control of its properties together with Peoples. Accordingly, Argus cannot be regarded together with Peoples and Northern as part of a single integrated system and it can be retained in combination with Peoples only if its retention satisfies the standards of the (A), (B). (C) clauses.

A. *The Principal System*—We must, in order to dispose of the issues before us, base our opinion on one of the inte-
426 grated systems controlled by Northern as the "principal system." Northern has not indicated any choice in this matter. For the reasons hereinafter set forth we have concluded that clauses (A) and (C) would bar the retention by Northern of both Peoples and Argus. Since the Peoples system has assets valued at $2,835,241 as against Argus' assets of $2,598,858, since Peoples' net income for 1940 was $203,137 as against Argus' $100,242, and since, for the reasons hereinafter discussed, we find that Northern can retain its directly owned transmission lines along with Peoples (while such retention could probably not be permitted if Argus were kept as the principal system), we assume that,

427

faced with a choice, Northern would elect Peoples as its principal system. We should not be disposed to question such a choice. Consequently, we shall base the remainder of our discussion and our order on Peoples as the principal system in the Northern holding company group. However, we will afford Northern a further opportunity to present argument, if it so desires, with respect to this question.

It has been suggested that the transmission lines of Northern may be considered together with the properties of Peoples as a single integrated gas utility system. As we have pointed out, however, Northern is not a gas utility company within the meaning of the Act and there is considerable question whether, under Section 2(a)(29)(B) the facilities of companies which are not gas utility companies can be regarded as part of an integrated gas utility system. The definition in Section 2(a)(29)(B) refers exclusively to "gas utility companies," and it is suggested that this exclusive reference precludes any intention to comprehend within an integrated gas utility system companies which are not gas utilities under the Act. However, we need not now decide this question since, for the reasons hereinafter stated, we find that in any event Northern can retain the transmission lines along with Peoples under the "other business" clauses of Section 11(b)(1).

428

429

B. *The Additional Systems Retainable by Northern*—Taking Peoples as the principal system, the retention of Argus would satisfy clause (B) of Section 11(b)(1) since Argus is located in Kansas and some of Peoples' properties are located in Nebraska, which adjoins Kansas.

As we have stated, the evidence in the record is insufficient to enable us to determine that there are substantial economies, or indeed any economies, resulting from joint

430 ownership of Peoples' and Argus' properties. Argus purchases most of its gas from non-affiliated sources, while Peoples acquires almost all of its gas from Northern. There are physical differences in the properties of Argus and Peoples; different installation standards, different practices respecting meter ownership and testing. We could not, therefore, make the finding required by clause (A) to permit the retention of Argus as an additional system. However, even were such a finding possible, clause (C) would bar such retention.

431 The record does not show that the centralized control of Argus and Peoples leaves, to each of them, the advantages of localized management. The evidence which merely shows divisional maintenance, location of local offices, and localization of retail activities, is not sufficient. When in fact management is highly centralized, as it is in Northern's main office at Omaha, and there is no evidence as to the local nature of important policy determinations, we cannot find that the advantages of localized management are not impaired by central control. We believe that under clause (C) no combination of systems should be permitted which would

432 impair true localization of management and policy-making. Otherwise, as is the case in the area in which Northern operates, small communities are pitted against strong "absentee control" with respect to matters vitally affecting the interests of the communities. Insofar as possible, we are required under Section 11(b)(1) to insure local management responsive to local needs and local public feeling.[48]

---

[48] "An operating system whose management is confined in its interest, its energies, and its profits to the needs, the problems, and the service of one regional community is likely to serve that community better, to confine itself to the operating business, to be amenable to local regulation, to be attuned and responsible to the fair demands

433

C. *The "Other Businesses" Retainable by Northern*—The great bulk of Northern's assets is represented by its directly held production and transmission properties. Of a total of group assets (*i.e.*, the assets of Northern, Peoples, and Argus) of $55,384,707, almost $50,000,000 is represented by the production and transmission facilities owned by Northern.

The question presented here is whether this vast enterprise can be regarded as "reasonably incidental, or economically necessary or appropriate" to the operations of any integrated system retainable by Northern. In general, the pattern of the statute and the context of the relevant statutory provisions seem to indicate that the "other business" tests are not to be applied to operations grossly out of proportion to the utility business with respect to which they are claimed to be "reasonably incidental, or economically necessary or appropriate." In the ordinary case, therefore, we believe the statute contemplate that after compliance with Section 11(b)(1) the integrated utility systems retainable by a registered holding company will constitute its primary business and that retainable non-utility interests will occupy a clearly subordinate position. However, the problems in the natural gas utility industry and the problem in this case, in particular, present an exceptional situation. Northern's pipe lines supply all of People's gas and appear to be vital

434

435

---

of the public, and, more often, to get along with the public to mutual advantage . . . Essentially local systems will tend to operate utilities rather than to play with high finance; and essentially local enterprise is far less likely to accumulate a disproportionate amount of political and economic power." (Report from the Committee on Interstate Commerce, 74th Cong., 1st Sess., Report No. 621 to Accompany S. 2796, May 13, 1935, p. 12.)

to its operations.[49] Although there may be some question whether Section 2(a)(29)(B) permits us to regard the facilities of Northern as part of the "integrated gas utility system" of Peoples, we believe it has been shown that the joint ownership of these facilities satisfied the standards of the "other business" clauses and that Northern may therefore retain its transmission lines in combination with the properties of Peoples.

We cannot emphasize too strongly, however, that our conclusion with respect to the retention of the transmission
437 lines of Northern as a permissible "other business" is highly conditioned by the facts of this case—and particularly by the fact that the question here presented is one of a natural gas utility company deriving its entire gas supply from transmission lines which bridge the gap from the source of supply to the ultimate consumer.[50]

Conclusions with Respect to Northern Natural Gas—At present Northern is a registered holding company and a respondent in this proceeding. We must, therefore, require its compliance with Section 11(b)(1). In accordance with
438 the foregoing, and subject to a further opportunity to be afforded to Northern for the presentation of its views as to the choice of a principal system, our order will direct Northern, as a registered holding company, to divest itself of its interest in Argus Natural Gas Company.

---

[49]This is not the case with respect to Argus, which purchases almost all its gas from non-affiliated sources.

[50]See Hearings before the Senate Committee on Interstate Commerce, 74th Cong., 1st Sess., on S. 1725, at p. 673. See, too, *id.*, pp. 148, 958; and Hearings before the Committee on Interstate and Foreign Commerce, House of Representatives, 74th Cong., 1st Sess., on H. R. 5423, pp. 1747, 1794-95, 1865, 2254, 2280.

VI. The Holding Company System of Illinois Traction Company

Illinois Traction Company, a subsidiary of Light & Power and itself a registered holding company, is not engaged directly in any business other than that of a holding company. It has 16 direct and indirect subsidiaries, some of which are actively engaged in the gas and electric utility, ice, steam, water, transportation, and terminal businesses, and some of which are inactive.

As of December 31, 1940, the capitalization of Illinois 440
Traction Company was as follows:

6% cumulative preferred stock (217 shs. of $100 par value)	$ 21,700
Common stock (115,723 shs. of $100 par value)	11,572,300
Surplus (Deficit)	(14,920,039)

At the same date it was indebted to Light & Power to the extent of $12,695,317, which is not included in the above surplus deficit figure. It has not paid dividends on its preferred stock since January 1, 1933. Light & Power holds 441
70 shares of its preferred and 115,666 shares of its common stock.

Illinois Traction carries its own investments at $23,588,526. The largest of these is its investment in 300,000 shares of common stock (of a total of 783,805 shares outstanding) of Illinois Iowa Power Company, which is carried at $21,563,597.[51]

---

[51] In addition, Illinois Traction held 300,000 warrants to purchase an equal number of shares of Illinois Iowa's common stock. These warrants are carried on Illinois Traction's books at $1. Light & Power had direct interests at December 31, 1940, in Illinois Iowa

Although the statement was made on the record that Illinois Traction Company was to be dissolved, it is still before us as a registered holding company and a respondent in this proceeding, and we must order it to comply with the requirements of Section 11(b)(1).

Illinois Traction's subsidiaries operate two large electric utility systems and several smaller electric properties. One of the larger systems, located in northern, central, and southern Illinois, is operated by Illinois Iowa Power Company and Kewanee Public Service Company, both direct subsid-
443 iaries of Illinois Traction. The other, in south central Iowa, is operated by Des Moines Electric Light Company, a subsidiary of Illinois Iowa, and Iowa Power and Light Company, a subsidiary of Des Moines.

The capitalization of Illinois Iowa, as of December 31, 1940, was:

Funded Debt	$ 97,228,100
Preferred Stock	24,175,000*
Common Stock	19,595,125
Earned Surplus (since May 1, 1937)	7,137,746
444 Paid-in Surplus	14,168,648
Total	$162,304,619

* Dividend arrears on this stock amounted to $4,432,083 in 1940.

through ownership of 4,800 shares of 5% cumulative convertible preferred stock, 800 certificates for dividend arrears and $16,000 principal amount of 5½% debentures, the aggregate carrying value being $139,215.

North American carried a small direct investment in Illinois Iowa common stock at $53,085, and carried a direct investment in its preferred at $155,795. In addition, it held directly dividend arrears certificates carried at December 31, 1940, at $56,547, and funded debt carried at an aggregate of $621,734.

After deduction of depreciation reserves, the property and plant account of the company amounted to $92,547,632, as of this same date. It carried investments in its subsidiaries at $67,123,872.[52]

Kewanee, whose operations are closely related to the electric operations of Illinois Iowa, carries its plant and property at $2,160,897 (with a depreciation or retirement reserve of $346,987).

The combined net income of both these companies in 1940 was $2,078,194. Illinois Iowa accounted for $2,073,198 of this amount. 446

The capitalization of Des Moines and Iowa Power and Light, (whose electric operations are closely related and which we find, for reasons hereinafter stated, together operate a single integrated electric utility system) at December 31, 1940, was:

Long Term Debt	$13,216,000
Advances from Illinois Iowa	3,300,000
Preferred Stock	6,323,300
Common Stock	6,700,000
Surplus	2,303,963
Total	$31,843,263

447

[52]On August 22, 1941, we issued a notice of and order for hearing (Holding Company Act Release No. 2953) instituting proceedings under Section 11(b)(2) of the Act against Illinois Iowa Power Company. The order makes the tentative charge that, upon the basis of an examination of the corporate structure of Illinois Iowa and its subsidiaries, it appears to the Commission that:

"The corporate structure of Illinois Iowa Power Company unduly and unnecessarily complicates the structure and unfairly and inequitably distributes voting power among security holders of the holding company system of which it is a part."

This proceeding is now pending before us.

Illinois Iowa holds all the common stock of Des Moines and $1,750,000 of Des Moines' bonds, which holdings it carries at $8,839,387.

The total operating revenues of Des Moines and Iowa Power and Light in 1940, on a consolidated basis, were $7,086,710 and net income, upon the same basis, was $1,575,688.

The securities of Iowa Power and Light are held as follows:

449

Security	*Amount*	*Held By*
Funded Debt	$11,466,000	Public
Preferred Stock	6,372,900	$49,600 by Des Moines, remainder by public
Common Stock	2,500,000	Des Moines

A. *The Principal System* — Neither Illinois Traction Company nor Illinois Iowa Power Company has indicated its choice of any "principal system." In order to dispose of the issues here raised, we have decided to base this opinion and our order herein on the largest and most important electric utility system included in the operations of Illinois Iowa 450 and Kewanee as the principal integrated system of Illinois Traction Company, and of Illinois Iowa. However, Illinois Traction and Illinois Iowa will be afforded a further opportunity to present argument, should they so desire, on the appropriateness of this choice of their principal system. Our order, insofar as it requires divestment by Illinois Traction and Illinois Iowa, will be subject to modification if after presentation of further argument or evidence in this respect, such modification should appear to be necessary.

The principal system upon which our opinion and order herein are based includes the electric operations of Illinois

Iowa in the three large areas in northern, southern, and central Illinois and in the area in Sangamon and Logan Counties, together with the electric operations of Kewanee Public Service Company.

Respondents have asserted that the limits of the system thus described are too narrowly confined. They contend (1) that certain electric operations conducted by Illinois Iowa in four additional areas must be considered together with the other electric operations of Illinois Iowa and Kewanee as part of a single integrated electric utility system, and (2) 452 that the electric operations of Des Moines and Iowa Power and Light must also be considered together with all the electric operations of Illinois Iowa and Kewanee as a single integrated system.

1. The additional electric operations conducted by Illinois Iowa, to which respondents' first contention relates, are relatively small in size and are located in the central and southern portions of Illinois, in regions around Jacksonville, Enfield, Eldorado, and Cairo, respectively. Although the main areas which we have held constitute the principal integrated system are physically interconnected by means of 453 lines owned, or leased for joint use, no such connections exist among any of the four small areas, or between any of them and the main areas. The only physical interconnection which may be said to exist between the smaller areas and the principal operations of Illinois Iowa results from the fact that facilities in the smaller areas are connected with facilities operated by Central Illinois Public Service Company, a non-affiliated company whose territory adjoins that of Illinois Iowa.

We cannot find that the operations in these smaller areas can be considered together with the principal operations of

Illinois Iowa as a single integrated electric utility system. In determining the boundaries of an integrated electric utility system under Section 2(a)(29), we must find that the utility assets included therein are physically interconnected or are capable of such interconnection, *and* that these utility assets under normal conditions may be "economically operated as a *single interconnected and coordinated system*" (Emphasis supplied.) We think it clear that the quoted language refers to the *physical* operation of utility assets (not the management of the company or companies owning
455 them) as a *single interconnected and coordinated* system; that is, a system in which (*inter alia*) the generation and/or flow of current within the system may be centrally controlled and allocated as need or economy directs, and which is operated as a unit. Thus, even though we find physical interconnection exists or may be effected, evidence is necessary that in fact the isolated territories are or can be so operated in conjunction with the remainder of the system that central control is available for the routing of power within the system. We can make no such finding with respect to the four
456 smaller areas. Power sold by Illinois Iowa in the Jacksonville, Enfield, and Eldorado areas is purchased from the Central Illinois Company. The Cairo area has a generating station, but Illinois Iowa's management regards it as more economical to purchase power for that area from the same company. Although it has been admitted that present interconnection of the four smaller areas with the rest of the system by facilities of Illinois Iowa is not "economical" or "provident," it is claimed that the operation of the electric facilities in these areas is "thoroughly coordinated" and "efficiently carried on." This may be true with respect to corporate management, but the record does not convince us

that all of the electric facilities of Illinois Iowa are, or can be, operated physically *as a single interconnected and coordinated system.*

2. Nor can we agree with respondents' contention that the electric operations of Des Moines and Iowa Power and Light, located in southern Iowa, should be considered together with the electric operations of Illinois, Iowa and Kewanee as a single integrated electric utility system.

It has been stipulated that these properties are capable of physical interconnection. However, the evidence indicates 458
that they are separately operated and that at present there is no physical connection betwen them except through facilities owned by other companies and running through foreign service territories. There is nothing in the record which would indicate that physical interconnection of the two properties by means of their own facilities is contemplated or is possible within the reasonably near future. The statute defines an integrated electric system as one—

> "consisting of one or more units of generating plants and/or transmission lines and/or distributing facilities, whose utility assets, whether owned by one or more electric utility companies, are physically interconnected or capable of physical interconnection and which under normal conditions may be economically operated as a single interconnected and coordinated system confined in its operations to a single area or region, in one or more States, not so large as to impair (considering the state of the art and the area or region affected) the advantages of localized management, efficient operation, and the effectiveness of regulation." (Section 2(a)(29).) 459

There has been no attempt to show that the Illinois and Iowa properties are at present operated as a "coordinated"

system, or that such operation under "normal" conditions is possible. While we need not here discuss all the possible meanings of the term "normal conditions," certainly it does not refer to conditions which might occur in the remote future, and whose occurrence has not been foreshadowed by any facts shown in the record. Accordingly, we cannot find that the Illinois and Iowa properties together constitute a single integrated electric utility system.

We conclude, therefore, that the electric operations of Illinois Iowa in the four main service territories in northern,
461 central, and southern Illinois, together with the electric operations of Kewanee Public Service Company, constitute those of a single integrated electric utility system within the meaning of the Act. We find further that the electric operations of Illinois Iowa conducted in and around Jacksonville, Enfield, Eldorado, and Cairo constitute four separate and additional integrated electric utility systems, and that the electric operations of Des Moines and Iowa Power and Light constitute still an additional integrated electric utility system.

462 B. *The Additional Utility Systems Retainable by Illinois Traction Company.*

1. *The Additional Electric Utility Systems*—We must consider next whether the four smaller integrated electric utility systems of Illinois Iowa and the integrated electric utility system of Des Moines and Iowa Power and Light are retainable as additional systems to that of the principal system of Illinois Iowa and Kewanee. Since all of these systems are located in Illinois and Iowa, clause (B) does not bar their retention by a single holding company.

We find that the four smaller systems of Illinois Iowa cannot be operated as independent systems without the loss

of substantial economies which can be secured by their retention under joint control together with the principal system of Illinois Iowa and Kewanee; and that the combination of all of these systems under the control of a single holding company is not so large as to impair the advantages of localized management, efficient operation, and the effectiveness of regulation. Accordingly, we hold that the four smaller systems of Illinois Iowa may be retained in addition to the principal system of Illinois Iowa and Kewanee. We cannot find, however, that the electric utility system of Des Moines and Iowa Power and Light can be retained as 464
an additional system under the statute.

The principal argument advanced with respect to retention of the electric utility system of Des Moines and Iowa Power and Light is based on the claim, already disposed of, that it and the electric properties of Illinois Iowa constitute a single system. However, Light & Power has also requested findings that the electric utility system of Des Moines and Iowa Power and Light cannot be operated independently without the loss of substantial economies and that the combination of these properties together with the electric operations of Illinois Iowa and Kewanee would satisfy clause 465
(C).

The testimony of C. A. Leland, president of both the Des Moines and Iowa Power and Light companies, is cited to us for the proposition that substantial economies would be lost by a severance of the systems. We can find no support in the record for this claim. Some of this testimony represents the witness' opinion as to the advantages of holding companies generally. Some of it is evidence of contact with North American and its direct subsidiaries—of little value in assessing the relationship between the Illinois Iowa and

the Des Moines and Iowa Power and Light systems. Neither system has any substantial contacts in respect of its operations with either Illinois Traction Company or Light & Power.[53] The evidence respecting the relationship between the two systems does show that the Des Moines and Iowa Power companies pay salaries to certain personnel of Illinois Iowa for services performed.[54] However, upon careful consideration of the record, we cannot find that it has been shown that severance of the affiliation of these systems would deprive either of them of irreplaceable services, or involve
467 such an increase, if any, in the cost of benefits now received from intra-system contacts that the loss of substantial economies would result from the operation of each as an independent system.

Since we cannot find that clause (A) would be satisfied by the retention of both systems under common control, we must order Illinois Traction Company to divest itself of the electric utility system operated by Des Moines and Iowa Power and Light.

It may be appropriate also to cite one important factor which bears on the question whether the retention of the
468 Illinois and Iowa systems in combination would meet the standards of clause (C).

It has been stated that the Iowa companies are subject to regulation by the Iowa State Commerce Commission with respect to the routing of gas and electric transmission lines

---

[53]The only evidence of any such contact is that of a single instance of aid by Allen Van Wyck, president of Light & Power, in a Des Moines financing in 1938.

[54]This evidence shows instances of engineering and chemical consultation and aid to Des Moines in 1936 and 1939, assistance in rate matters, exchange of advertising and other promotion information, and aid in accounting and taxation problems.

and the standards of their construction. However, rates are not centrally regulated but are the subject of negotiation with individual communities served by the Iowa companies. The absence of such central regulation makes it particularly necessary to apply rigorously the standards of clause (C) to insure the localization of each system's policy determinations. When the making of policy is in the hands of men who are not in their daily business activities responsive to local public feeling, and when the great resources of holding companies are pitted against local communities in their attempts at regulation, the growth of the holding company 470 results in a direct impairment of "effective public regulation." (See Section 1(b)(5).) Section 11(b)(1) is designed to limit such growth and to correct such situations where they exist at present. It must be interpreted to achieve that result. For that reason alone we could not find that the combination of the Illinois and Iowa systems under joint control would meet the standards of clause (C).

2. *The Additional Gas Utility Systems*[55]—All of the four electric utility subsidiaries of Illinois Traction Company (*i.e.*, Illinois Iowa, Kewanee, Des Moines, and Iowa Power 471 and Light) are also gas utility companies. Another subsidiary, Cahokia Manufacturers Gas Company, owns only gas facilities which are leased to Illinois Iowa.

---

[55]We have been asked to find that all of the electric and gas operations of Illinois Traction's subsidiaries in Illinois and Iowa taken together constitute a single integrated system. This request must be rejected. First, we have already pointed out that gas and electric properties may not be retained together as parts of a *single* integrated system. *Columbia Gas & Electric Corporation*, 8 S. E. C. —— (1941), Holding Company Act Release No. 2477; *The United Gas Improvement Company, et al.*, 9 S. E. C. —— (1941), Holding Company Act Release No. 2692. Second, we have held that the combination of the electric properties alone cannot be regarded as a single system.

472 Illinois Iowa and Kewanee, in 1940, distributed gas to 54 communities in 11 isolated areas in the State of Illinois. A total of 99,600 gas customers was served with 23,320,000 therms of gas, and these sales accounted for approximately 15% of the $21,605,000 aggregate operating revenues on a consolidated basis of these companies. The only territory served with gas by Illinois Iowa and Kewanee, which is not also served with electricity, lies in and around East St. Louis. Eight gas production plants are owned and, in 1940, gas was also purchased from three unaffiliated sources. It is
473 stated that the flow of gas from all sources is centrally directed from Decatur.

The gas facilities owned by Illinois Iowa and Kewanee consist of relatively small separate branch transmission lines serving separate retail systems and a transmission line fed with enriched manufactured gas out of East St. Louis. The transmission lines serving the various retail areas in Illinois are not generally physically interconnected. As of December 31, 1940, the total book value of fixed assets used in the electric operations of Illinois Iowa and Kewanee was $65,614,537, and the book value of fixed assets used in the
474 gas operations was $22,806,652.

We need not decide now, and indeed the evidence is such that we cannot decide, the number or the confines of the integrated gas utility systems controlled by Illinois Iowa, Kewanee, and Cahokia Manufacturers Gas Company. Their retention, together with the retainable electric operations of Illinois Iowa Kewanee, would not be barred by clause (B) since, except for the territory of East St. Louis, the gas operations cover the same area as the retainable electric operations. The evidence introduced to show that the standards of clauses (A) and (C) have been met indicates some

evidence of joint use of facilities, personnel, and management. But, here again, we do not think the record contains an adequate exploration of the relevant evidence bearing on this question. (Compare the discussion *supra*, pp. ——, of the retainability of the gas operations of the Union group and St. Louis County Gas Company.) We have therefore decided not to make any findings on this matter at this time. The record will be reopened for the purpose of receiving further evidence bearing on the permissibility under the Act of retention of these gas operations in addition to the retainable electric operations of Illinois Iowa and Kewanee. Our 476 order setting the date for the further hearing will contain a statement of the specific matters on which we desire to have additional evidence presented.

There is no evidence in the record which would permit us to find that the gas operations conducted by Des Moines and Iowa Power and Light may be retained. The evidence introduced in this respect deals only with the relationship existing between the gas and electric operations of these two companies. We have already held that these electric properties must be disposed of, and we cannot find that their gas operations meet the standards of clauses (A), (B), and 477 (C) in relation to the properties of Illinois Iowa, Kewanee, or Cahokia Manufacturers Gas Company.

C. *The "Other Businesses" Retainable by Illinois Traction Company*—Non-utility operations in the Illinois Traction system are conducted by Western Illinois Ice Company, a direct non-utility subsidiary of Illinois Traction Company, by Illinois Iowa and two of its subsidiaries, Illinois Terminal Railroad Company and Central Terminal Company, and by Des Moines Electric Light Company.

1. *Illinois Traction's Direct Non-Utility Subsidiary.*

(a) *Western Illinois Ice Company*—This company operates ice manufacturing plants in Galesburg and Kewanee, Illinois. Its net operating revenues in 1940 amounted to $35,603. It purchases current from Illinois Iowa and certain services are performed for it by Illinois Iowa personnel. Illinois Traction, which holds all its common stock, carried that investment at December 31, 1940, at $235,755. No claim has been made that retention of this business is warranted
479 under the "other business" clauses, and, on the record before us, we cannot find, under the standards of Section 11(b)(1), that its retention is reasonably incidental, or economically necessary or appropriate to the operations of any retainable utility system of Illinois Traction. Accordingly, divestment thereof must be required.

2. *"Other Businesses" of Illinois Iowa.*

(a) *Steam heating business*—Seven communities in the service territory of the electric operations of Illinois Iowa are supplied with steam generated in boilers located in elec-
480 tric generating stations, and operated by personnel also engaged in the electric operations. The business produced net revenues before taxes and depreciation of $70,118 in 1940, and had an aggregate of $1,975,330 of assets at December 31, 1940. The supplying of steam is intimately related to the operations of the electric utility systems of the company, and we find that the business is retainable as reasonably incidental, or economically necessary or appropriate to such operations.

(b) *Water business*—Water service is rendered in three communities which are in the service areas of Illinois Iowa's

481

electric operations. This business produced net operating revenues, in 1940, of $30,210. As of the end of 1940, the book value of fixed assets used in the business was $1,371,598. In one of the communities served (Marseilles), pumping equipment is located in one of Illinois Iowa's generating stations. All energy used in the water business is supplied by Illinois Iowa. It is stated that though efforts have been made to sell this water business, it has been found "almost impossible" to procure an "even approximately satisfactory" offering, and that the Illinois Commerce Commission would not permit an abandonment of the business.

482

We have already noted that arguments based on the asserted difficulty of disposition of a property are irrelevant in a consideration of whether it may be retained under the standards of Section 11(b)(1). Such arguments are pertinent only to the question when compliance with a divestment order should be enforced. The only other claims asserted to support the retention of this business are that it is a customer of Illinois Iowa and that it maintains some of its equipment in one of Illinois Iowa's generating stations. We cannot find that these facts show such a relationship between this water business and the operations of the retainable utility operations as would justify a finding that retention of this business meets the standards of Section 11(b)(1). We must therefore order its divestment.

483

(c) *Ice business*—Illinois Iowa operates ice manufacturing plants in five Illinois communities. These operations produced net operating revenues before taxes and depreciation in 1940 of $10,357. Current for the business is provided by Illinois Iowa.

No claim has been made that this business is retainable and since we cannot find that it is reasonably incidental, or

economically necessary or appropriate to the operations of the retainable utility systems, our order will require its divestment.

(d) *Oil drilling*—Certain territory around Centralia (in the area of Illinois Iowa's electric operations) is proven oil land. Illinois Iowa has constructed three oil wells in this territory and invested about $56,000. They have produced, since their operation, an income, after all expenses and taxes, of $60,000. The oil has, to some extent, been used in the
485 Centralia gas plant of the company for the production of carburetted water gas. It has, it is claimed, also been used in other plants of the company after having been repurchased from the pipe line company to which it was sold.

On the basis of the record before us, we cannot find that a sufficient relationship between this oil business and the operations of the retainable utility systems has been shown to justify a finding that retention of the oil business meets the standards of Section 11(b)(1). Accordingly, its divestment must be ordered.

(e) *Transportation business*—Illinois Iowa conducts a
486 street railway, trolley, and gasoline motor bus service in Peoria, Illinois, which is outside its utility service territory. Power for these properties has been purchased from unaffiliated sources. The business produced, in 1940, net operating revenues before taxes and depreciation of $196,436 on an investment in fixed assets carried at $5,392,000. It has been stated that attempts have been made to sell the properties, but that the prices offered have not been deemed sufficient.

The record does not warrant a finding that retention of this business is reasonably incidental, or economically necessary or appropriate to the operations of the retainable utility systems of Illinois Traction. Its divestment must be ordered.

487

(f) *Illinois Terminal Railroad Company and Central Terminal Company*—Illinois Terminal Railroad Company is an Illinois corporation organized in 1937 to take over the consolidated properties of five railroad companies. Its general office is in St. Louis, Missouri, and its property is located in Missouri and Illinois. As of December 31, 1940, the Railroad Company had outstanding:

Funded Debt	$14,229,000
Advances from Illinois Iowa	492,325
Common Stock	25,000,000

488

All of its common stock is held by Illinois Iowa.

Central Terminal Company owns and operates a warehouse and office building in St. Louis in which terminal facilities are supplied. These latter facilities are leased to the Railroad Company. The Terminal Company also conducts certain minor real estate operations. As of December 31, 1940, the book value of its fixed assets amounted to $6,901,286. As of the same date, the Terminal Company had outstanding:

489

Funded Debt	$ 725,000
Advances from Illinois Iowa	4,648,063
Common Stock	1,000,000

All of its common stock is held by Illinois Iowa.

The Railroad Company operates a steam and electric road whose tracks form a web around St. Louis and East St. Louis and run thence up to Peoria, in central Illinois, form a loop at Springfield, Mackinaw, Bloomington, and

Decatur, and run eastward into Danville.[56] It is a standard gauge road and its freight equipment is interchangeable with any road using standard equipment. It is subject to the jurisdiction of the Interstate Commerce Commission.

The Railroad Company also owns a dock and barge loading plant at Alton, Illinois, used primarily for the loading of barges for the Mississippi coal and coke traffic. In addition, it runs passenger busses between East St. Louis and Granite City, Illinois, and owns a toll and railroad bridge (the McKinley Bridge) across the Mississippi River. As of December 31, 1940, the total book value of all its fixed assets was $51,728,769.

The arguments made for retention of the Railroad Company's properties are (1) that prior to 1923 certain electric and railroad facilities in Illinois Iowa's service area were jointly owned; (2) that the Railroad Company is the largest customer of Illinois Iowa; (3) that much equipment owned by Illinois Iowa is primarily devoted to serving the road and that telephone facilities owned by the road are also used by Illinois Iowa; (4) that certain joint facilities are cared for by joint personnel; (5) that economies result from common ownership; and (6) that it is difficult to sell the railroad properties. No argument for retention of the Terminal Company is made save that it should "obviously" be under common control with the railroad.

We have discussed at some length the criteria which we think are relevant to the question whether various interests

[56] The properties of this company also include an electric railway line between St. Louis and Alton, formerly owned by St. Louis & Alton Railway Company (a wholly-owned subsidiary of Union Electric Company of Missouri) and leased to Illinois Terminal. On December 31, 1940, St. Louis & Alton Railway sold these properties to Illinois Terminal and on April 18, 1941, St. Louis & Alton was dissolved.

may be retained under the "other business" clauses of Section 11(b)(1) (see pp. — · —, *supra*), and have already disposed of contentions identical with those made here. A showing of historical relationship between the railroad and the electric facilities of Illinois Iowa, the fact that the railroad is its largest customer, and the alleged difficulty of disposing of the railroad properties have no bearing on this question. The use of certain joint facilities and the economies resulting from common ownership do have some pertinency but, after careful analysis of the evidence and arguments presented, we cannot find that the relationship of the Railroad and Terminal properties to the operations of the retainable utility systems of Illinois Traction is such as to warrant retention of these railroad and real estate properties under the control of a registered public utility holding company.

We have consisted the applicability of the "other business" clauses of Section 11(b)(1) to a railroad business controlled by the Union group and, under facts showing a very close relationship between the railroad business and the utility system, we concluded that the railroad business could be retained. (See pp. ——, *supra.*) There are no comparable facts here. We cannot find under Section 11(b)(1) that the Railroad and Terminal companies' businesses are reasonably incidental, or economically necessary or appropriate to the operations of any integrated public utility system retainable by Illinois Traction. Accordingly, we must order Illinois Traction and Illinois Iowa to divest themselves of these interests.

(g) *Dormant companies*—Certain direct subsidiaries of Illinois Iowa, which have no tangible assets and do no business, have been kept in existence for the purpose of preserving franchises in areas in which Illinois Iowa conducts its

gas business,[57] or because unsettled claims against them are outstanding.[58] One of these companies, the Venice Gas Company, has assigned its franchise to Illinois Iowa and that company now operates under the franchise.

It has been stated that these companies will be "dissolved as soon as circumstances permit." The ownership of franchises in the area served by Illinois Iowa appears to be closely related to the gas operations of the system and since we have determined to reserve decision with respect to the
497 gas operations, we shall also reserve judgment as to these companies. As to St. Louis Electric Terminal Railway Company, since it does no business whatsoever, and since it is merely being kept alive in connection with the settlement of outstanding claims, we must require that it be separated from the Illinois Traction system by dissolution or otherwise.

3. *"Other Businesses" of Des Moines Electric Light Company*—The only non-utility business engaged in by Des Moines and its subsidiary, Iowa Power and Light, is a heating business. The evidence with respect to this business deals only with its relationship to the utility operations of
498 Des Moines and Iowa Power and Light. Since we have concluded that these utility operations must be disposed of, we cannot find, under Section 11(b)(1), that this heating business is reasonably incidental, or economically necessary or appropriate to the operations of any retainable utility system of Illinois Traction Company.

---

[57]These companies are Cairo City Gas Company, Champaign and Urbana Gas Light and Coke Company, Decatur Electric Company, Danville Gas Light Company, The Jacksonville Gas Light & Coke Company, Jacksonville Railway and Light Company.

[58]These companies are St. Louis Electric Terminal Railway Company and Venice Gas Company.

499

Conclusions with Respect to the Illinois Traction System—In accordance with the foregoing, Illinois Traction Company and Illinois Iowa Power Company will be ordered to divest themselves of all holdings, direct and indirect, of the securities of Des Moines Electric Light Company and Iowa Power and Light Company. Illinois Traction will also be required to divest itself of all of its holdings of securities of Western Illinois Ice Company; and Illinois Traction and Illinois Iowa will be directed to dispose of the water, ice, oil drilling, and transportation business of Illinois Iowa, the railroad, terminal, and real estate businesses of Illinois Iowa's subsidiaries, Illinois Terminal Railroad Company and Central Terminal Company, and the securities of St. Louis Electric Terminal Railway Company.

500

As we have indicated, Illinois Traction and Illinois Iowa will be afforded a further opportunity to present argument, should they so desire, on the appropriateness of the choice of the electric operations of Illinois Iowa and Kewanee as their "principal system"; and our order, insofar as it requires divestment by Illinois Traction and Illinois Iowa, will be subject to modification if, after presentation of further argument or evidence in this respect, such modification appears necessary. We shall order a further hearing on the question whether the gas properties of Illinois Iowa, Kewanee and Cahokia (and the dormant companies kept alive for franchise reasons) may be retained in combination with the retainable electric properties.

501

VII. The Holding Company System of Illinois Iowa Power Company

Illinois Iowa is not only an operating company and a subsidiary of Illinois Traction, but is itself a registered

holding company heading a large system. However, all of the problems which arise in the application of the standards of Section 11(b)(1) to Illinois Iowa's holding company system have already been discussed and disposed of in connection with our discussion of the Illinois Traction system.

Subject to any further argument which may be requested as to the appropriateness of the choice of its "principal system," we have held that Illinois Iowa may retain its directly owned electric and steam heating properties. Our order will require the divestment of its water, ice, oil drilling, and
503 transportation businesses and the divestment of its holdings, direct and indirect, of the securities of Des Moines Electric Light Company, Iowa Power and Light Company, Illinois Terminal Railroad Company, Central Terminal Company, and St. Louis Electric Terminal Railway Company. We are reserving our decision with respect to the retainability of the gas properties of Illinois Iowa, Kewanee and Cahokia and the dormant companies kept alive for franchise reasons.

VIII. The Holding Company System of Des Moines Electric Light Company

504

Des Moines, a subsidiary of Illinois Iowa Power Company, is itself a registered holding company and a respondent in this proceeding. Des Moines is a Maine corporation organized in 1909. Its properties and those of its wholly-owned subsidiary, Iowa Power and Light Company, are located entirely in Iowa.

The territory served with electricity by Des Moines and Iowa Power and Light contains about 3,240 square miles. It is a solid area running 102 miles east to west, and 52 miles north to south. It has a total population of about 290,000. The companies serve 101 communities and inter-

vening rural areas, 99 with electricity, 8 with gas, and 1 with steam heat. The property devoted to the electric business represents 75.7% of the total of the properties of both companies; 23.6% of the properties are devoted to the gas and .7% to the heating businesses. Both companies own production, transmission, and distribution units.

A. *The Principal and Additional Systems of Des Moines* —Both companies own generating facilities (steam and hydro) which are interconnected and are also connected with the companies' transmission and distribution facilities. 506 These operations of both companies are conducted as a unit and, accordingly, we find that their electric operations constitute those of a single integrated electric utility system. The only question with respect to the retention of additional systems arises in connection with the gas business of the companies. Both Des Moines and Iowa Power and Light serve a total of eight communities with natural and manufactured gas. In 1940, 39,900 gas customers were served with 12,900,000 therms of gas. These operations accounted for 24% of the total operating revenues of the two companies. 93% of the gas customers of both companies reside in Des 507 Moines.[59]

We find that the gas operations of Des Moines and Iowa Power and Light constitute those of a single integrated gas utility system. However, for reasons similar to those mentioned in our discussion of the retainability of the gas operations of the Union group and those of Illinois Iowa,

[59]For the year ending December 31, 1940, total operating revenues for both companies from all sources were $7,086,710; $5,357,563 of this amount is accounted for by the electric business and $1,697,158 by the gas business. The book value of the companies' assets as of December 31, 1940, was $39,846,543, 23.6% of which was devoted to the gas business.

Kewanee and Cahokia (see pp. , *supra*), we will not at this time pass upon the question whether the gas operations of Des Moines and Iowa Power and Light may be retained as a system additional to their integrated electric system. The record will be reopened for the introduction of further evidence bearing on that question.

B. *The "Other Businesses" Retainable by Des Moines*—The only non-utility business engaged in by Des Moines and Iowa Power and Light is the rendition of heating service in
509 Oskaloosa, Iowa. In 1940 this business accounted for $31,989 of revenue. Boilers used for heating service are located in a station which is used also as a point of connection between the main electric transmission system of the company and the Oskaloosa distribution system. Personnel used in the station operate both the electric and steam services. We find that this heating business is reasonably incidental, or economically necessary or appropriate to the operations of the retainable utility systems of Des Moines.

Conclusions with Respect to Des Moines—Subject to the further hearing with respect to the retainability of the gas
510 operations, it will be unnecessary for Des Moines or Iowa Power and Light to take any action to comply with the requirements of Section 11(b)(1) of the Act.

Summary of Conclusions and Nature of Order

This summary of conclusions will indicate those interests and businesses, directly or indirectly held, controlled or operated, which must be disposed of by the various registered public utility holding companies in the North American system in order to comply with Section 11(b)(1) in accordance with our findings and opinion.

Each of the registered holding companies in the system will be ordered to sever its relationship with the companies set forth below its name by disposing, or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the Act or the rules and regulations promulgated thereunder, of its direct or indirect ownership, control, or holding of securities issued and properties owned, controlled or operated by the said companies:

I. *The North American Company*

512

Union Electric Land and Development Company
East St. Louis & Suburban Railway Company
East St. Louis Railway Company
Wisconsin Electric Power Company
The Milwaukee Electric Railway & Transport Company
Motor Transport Company
Badger Auto Service Company
Wisconsin Gas & Electric Company
Wisconsin-Michigan Power Company
Milwaukee Light, Heat & Traction Company 513
Hevi-Duty Electric Company
The Cleveland Electric Illuminating Company
The Power & Light Building Company
The Ceico Company
North American Light & Power Company
The Kansas Power and Light Company
Missouri Power & Light Company
The Blue River Power Company
The McPherson Oil and Gas Development Company
Power & Light Securities Company
North American Oil and Gas Company

Northern Natural Gas Company
Argus Natural Gas Company, Inc.
Peoples Natural Gas Company
Illinois Traction Company
Kewanee Public Service Company
Cahokia Manufacturers Gas Company
Western Illinois Ice Company
Illinois Iowa Power Company
Des Moines Electric Light Company
515 Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
Cairo City Gas Company
Champaign and Urbana Gas Light and Coke Company
Danville Gas Light Company
Decatur Electric Company
The Jacksonville Gas Light & Coke Company
Jacksonville Railway and Light Company
St. Louis Electric Terminal Railway Company
Venice Gas Company
516 Washington Railway and Electric Company
Potomac Electric Power Company
Great Falls Power Company
The Washington and Rockville Railway Company of Montgomery County
Braddock Light & Power Company, Incorporated
Capital Transit Company
Montgomery Bus Lines, Incorporated
The Glen Echo Park Company
West Kentucky Coal Company (New Jersey)
West Kentucky Coal Company (Delaware)
Peoples Coal Company

517

St. Bernard Coal Company
North American Utility Securities Corporation
Pacific Gas and Electric Company and its subsidiaries
The Detroit Edison Company and its subsidiaries.

The operations of the North American system will thus be limited to the electric, gas (pending further action), and steam heating operations of the Union group, the coal business of Union Colliery Company, the transportation business of St. Louis & Belleville Electric Railway Company, and the building owned by 60 Broadway Building Corporation. 518
Further hearings will be held with respect to the retainability of the gas operations of the Union group and St. Louis County Gas Company, and with respect to the retainability of 60 Broadway Building Corporation.

North American will be afforded further opportunity to present additional argument or evidence, if it so desires, with respect to the choice of its principal system.

II. *Union Electric Company of Missouri*

Union Electric Land and Development Company
East St. Louis & Suburban Railway Company 519
East St. Louis Railway Company.

The operations of the Union Electric system will thus be limited to the electric, gas (pending further action), and steam heating operations of the Union group, the coal business of Union Colliery Company, and the transportation business of St. Louis & Belleville Electric Railway Company. Further hearings will be held with respect to the retainability of the gas operations of the Union group and St. Louis County Gas Company.

520

III. *Washington Railway and Electric Company*

Great Falls Power Company
Capital Transit Company
Montgomery Bus Lines, Incorporated
The Glen Echo Park Company.

The operations of the Washington Railway and Electric Company system will be limited to the electric utility operations of Potomac Electric Power Company and Braddock
521 Light & Power Company, Incorporated.

IV. *The Washington and Rockville Railway Company of Montgomery County*

Great Falls Power Company.

The operations of the Washington and Rockville system will thus be limited to the electric utility operations of Braddock Light & Power Company, Incorporated.

V. *Northern Natural Gas Company*

522 Argus Natural Gas Company.

The operations of the Northern Natural Gas system will thus be limited to the gas operations of Peoples Natural Gas Company, and the gas production and transmission facilities of Northern Natural Gas Company.

Northern Natural Gas Company will be afforded the further opportunity to present argument as to whether it wishes to retain the Argus system rather than Peoples as its principal system.

523

VI. *Illinois Traction Company*

Western Illinois Ice Company
Des Moines Electric Light Company
Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
St. Louis Electric Terminal Railway Company.

Illinois Traction Company and Illinois Iowa Power Company will also be ordered to divest themselves of any interest, direct or indirect, in the water, ice, oil drilling and transportation businesses now engaged in by Illinois Iowa Power Company.

524

The operations of the Illinois Traction system will thus be limited to the electric and gas operations of Illinois Iowa Power Company and Kewanee Public Service Company, the gas operations of Cahokia Manufacturers Gas Company, and the steam heating business of Illinois Iowa Power Company. Further hearings will be held with respect to the retention of the gas operations.

Illinois Traction Company will be afforded a further opportunity to present evidence and argument on the question whether any single integrated utility system other than the major integrated electric utility system of Illinois Iowa Power Company and Kewanee Public Service Company shall serve as its principal system.

525

VII. *Illinois Iowa Power Company*

Des Moines Electric Company
Iowa Power and Light Company
Illinois Terminal Railroad Company

Illinois Iowa Power Company will also be ordered to divest itself of any interest held, directly or indirectly, in any non-utility business except the steam heating business which it now operates.

The operations of the Illinois Iowa Power Company system will thus be limited to its own electric, gas (pending further action), and steam heating businesses. Further hear-
527 ings will be held with respect to the retainability of the gas business.

Illinois Iowa Power Company will be afforded a further opportunity to present evidence and argument on the question whether any single integrated utility system now controlled by it other than the major electric utility system designated as its principal system in this opinion shall serve as its principal system.

VIII. *Des Moines Electric Light Company,* as a registered holding company, need take no action at this time to comply
528 with the requirements of Section 11(b)(1). Further hearings will be held with respect to the retention of the gas operations of Des Moines and Iowa Power and Light.

Our order will provide that its entry, publication and service shall be without prejudice to the right of the Commission, and that jurisdiction shall be reserved, to issue such other and further orders as may be necessary or advisable for securing compliance with the provisions of the Act and the rules and regulations thereunder, and in carrying out the provisions of the order. Our order will further provide that it shall in no way affect the conduct of such proceedings and the entry of such orders as the Commission shall deem

necessary and appropriate under Section 11(b)(2) of the Act.

* * *

At various points in this opinion and in connection with our discussion of the retention of various interests, we have adverted to respondents' claims of alleged difficulties in disposing of such interests. We have stated, and we again emphasize the fact, that, under the standards of the Act, difficulties of disposition have no bearing at all on whether any particular interest is retainable; and that such difficul- 530
ties are pertinent only to the question *when* compliance with our order of divestment should be enforced. Consequently, respondents' references to adverse market conditions for the sale of securities have no relevancy whatever *at this time*. The statute provides a year within which respondents may comply with our order. Furthermore, on an appropriate showing (which would certainly include a showing that bona fide attempts to dispose of properties had been prevented by adverse market conditions), we may grant an additional year for compliance. And even at that time our orders under Section 11(b)(1) are not self-enforcing. For under the Act 531
compulsory compliance can occur only after the Commission makes application to a court.

It is appropriate also to point out once again that compliance with our Section 11(b)(1) orders need not always be effected by the outright sale of properties for cash. It seems clear that a very large part of the divestments and dispositions necessary to comply with Section 11(b)(1) and our orders thereunder may be effectuated by stock dividends, by exchanges of portfolio securities with the security holders of the holding company, and through the exchange of prop-

532 *Findings and Opinion of the Commission*

erties between systems. It may be that these methods in practice will overshadow sales.

By the Commission (Chairman Purcell, Commissioners Healy, Pike, and Burke), Commissioner O'Brien not participating.

APPENDIX A

The following tabulation shows the place and date of organization and the nature of the business of each of the Companies in The North American Company System:

As of December 31, 1940.

Name of Company	*State of Organization and Date Thereof*		*Kind of Business*
The North American Company	N. J.	June 1890	Holding Company
Union Electric Company of Mo.	Mo.	Nov. 1922	Electric utility and heating company: also holding company 536
Union Electric Co. of Ill.	Ill.	July 1908	Electric and gas utility company
Union Colliery Company	Mo.	July 1917	Coal company
Mississippi River Power Co.	Mo.	Aug. 1910	Electric utility company
Iowa Union Electric Co.	Ill.	Dec. 1911	Electric and gas utility company
Cupples Station Light, Heat and Power Company	Mo.	Nov. 1896	Inactive
Union Electric Land and Development Company	Mo.	July 1929	Land company
St. Louis & Belleville Electric Railway Company	Ill.	July 1897	Electric railway company
St. Louis & Alton Railway Co.	Ill.	June 1926	None—inactive 537
East St. Louis & Suburban Railway Company	Ill.	Dec. 1893	None—inactive
East St. Louis Railway Co.	Ill.	May 1902	None—inactive
The St. Louis County Gas Co.	Mo.	Mar. 1912	Gas utility company
Wisconsin Electric Power Co.	Wis.	Jan. 1896	Electric utility and heating company
The Milwaukee Electric Railway & Transport Company	Wis.	Oct. 1938	Transportation company
Motor Transport Company	Wis.	Mar. 1919	Freight transportation company
Badger Auto Service Co.	Wis.	Jan. 1923	Parking stations and gasoline filling stations

Name of Company	*State of Organization and Date Thereof*		*Kind of Business*
Wisconsin Gas & Electric Co.	Wis.	June 1866	Electric and gas utility, heating and transportation company
Wisconsin Michigan Power Co.	Wis.	May 1911	Electric and gas utility and transportation company
Milwaukee Light, Heat & Traction Company	Wis.	Dec. 1896	Land company
Hevi-Duty Electric Company	Wis.	Nov. 1924	Electric furnace construction
539			
The Cleveland Electric Illuminating Company	Ohio	Sept. 1892	Electric utility and heating company
The Power & Light Bldg. Co.	Ohio	Mar. 1911	Real estate company
The Ceico Company	Ohio	Mar. 1929	Land and metering company
North American Light & Power Company	Del.	June 1924	Holding Company
The Kansas Power and Light Co.	Kan.	Mar. 1924	Electric and gas utility, heating, water, ice and transportation company
540 Missouri Power & Light Co.	Mo.	Dec. 1911	Electric and gas utility, heating, water and ice company
The Blue River Power Company	Del.	Oct. 1928	Electric utility company
Nebraska Natural Gas Co.	Neb.	May 1929	Gas utility company
The McPherson Oil & Gas Development Company	Kan.	May 1927	Gas production company
Power & Light Securities Co.	Del.	May 1928	Miscellaneous investments
North American Oil and Gas Co.	Del.	May 1930	None—inactive
Illinois Traction Company	Me.	May 1904	Holding company
Kewanee Public Service Co.	Ill.	Feb. 1924	Electric and gas utility company

Name of Company	*State of Organization and Date Thereof*		*Kind of Business*
Cahokia Manufacturers Gas Co.	Ill.	Jan. 1855	Owns gas distribution facilities leased to Illinois Iowa Power Co.
Western Illinois Ice Co.	Ill.	Apr. 1927	Ice company
Illinois Iowa Power Company	Ill.	May 1923	Electric and gas utility, heating, water, ice and transportation company; also holding company 542
Des Moines Electric Light Co.	Me.	July 1909	Electric and Gas utility and heating company; also holding company
Iowa Power and Light Co.	Ia.	Oct. 1924	Electric and gas utility company
Illinois Terminal Railroad Company	Ill.	Oct. 1927	Railroad company
Central Terminal Co.	Mo.	Mar. 1929	Warehouse company
Chicago and Illinois Valley Railroad Co.	Ill.	Sept. 1928	None—inactive
Cairo City Gas Company	Ill.	Feb. 1865	None—inactive

APPENDIX D

EXPLANATORY NOTES

A light solid line enclosing a company name indicates that the company is a holding company; a heavy solid line indicates a utility company; a broken line indicates a non-utility company; and a dotted line indicates an inactive company or a company in process of dissolution.

The figures shown in the boxes represent percentage of total voting securities held by the immediate parent, including securities having voting rights because of default or arrears.

Minor subsidiaries are omitted.

(1) Utilities Power & Light Securities holds 1.07%, North American Light & Power Company 0.32%, and The North American Company 0.74% of the voting stock.

(2) In addition The Washington and Rockville Railway Company of Montgomery County holds 33.12% of the common stock.

(3) In addition The North American Company holds 1.20% of the common stock.

(4) In addition The North American Company holds 0.09% of the common stock.

(5) The North American Utilities Securities Corporation owns 50% of the voting stock.

(6) In addition North American Utilities Securities Corporation owns 5.49% of the voting stock.

(7) In process of dissolution.

BEFORE THE

SECURITIES AND EXCHANGE COMMISSION

AT A REGULAR SESSION OF THE SECURITIES AND EXCHANGE COMMISSION, HELD AT ITS OFFICE IN THE CITY OF PHILADELPHIA, PA., ON THE 14TH DAY OF APRIL, A. D., 1942.

IN THE MATTER

of

THE NORTH AMERICAN COMPANY

and

ITS SUBSIDIARY COMPANIES

Respondents

File No. 59-10

Public Utility Holding Company Act
of 1935—Section 11 (b) (1)

ORDER REQUIRING DIVESTITURE BY HOLDING COMPANIES AND SUBSIDIARIES IN HOLDING COMPANY SYSTEM OF COMPANIES AND PROPERTIES OWNED OR OPERATED THEREBY

The Commission having on March 8, 1940, by notice and order for hearing, supplemented by a notice and order dated August 12, 1940, adding certain companies as respondents, instituted proceedings under Section 11 (b) (1) of the Public Utility Holding Company Act of 1935 against The North American Company and its subsidiaries to determine their status under said section, and The North American Company

583

and its subsidiaries having severally answered such notice and order; and

Hearings having been held after due notice, requests for findings of fact on behalf of such companies and briefs in support thereof having been filed, oral argument having been heard; and

The Commission being advised in the premises, and having this day issued its Findings and Opinion with respect to certain action which the Commission finds necessary to limit the operations of the holding company systems of The North American Company and its subsidiaries, including each subsidiary thereof which is a registered holding company and its subsidiaries, to a single integrated public utility system and additional systems and other businesses in accordance with the requirements of Section 11 (b) (1) of the Public Utility Holding Company Act of 1935;

584

IT IS ORDERED, pursuant to Section 11 (b) (1):

1. That The North American Company, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

585

Union Electric Land and Development Company
East St. Louis & Suburban Railway Company
East St. Louis Railway Company
Wisconsin Electric Power Company

586

The Milwaukee Electric Railway & Transport Company
Motor Transport Company
Badger Auto Service Company
Wisconsin Gas & Electric Company
Wisconsin Michigan Power Company
Milwaukee Light, Heat & Traction Company
Hevi-Duty Electric Company
The Cleveland Electric Illuminating Company
The Power & Light Building Company

587

The Ceico Company
North American Light & Power Company
The Kansas Power and Light Company
Missouri Power & Light Company
The Blue River Power Company
The McPherson Oil & Gas Development Company
Power & Light Securities Company

Great Falls Power Company;

5. That Northern Natural Gas Company, a registered public utility holding company, shall sever its relationship with the company named hereafter by disposing or causing

595

the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by:

Argus Natural Gas Company;

6. That Illinois Traction Company, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing or causing the disposition, in any appropriate manner not in contravention of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

596

Western Illinois Ice Company
Des Moines Electric Light Company
Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
St. Louis Electric Terminal Railway Company;

597

and that Illinois Traction Company shall cease to own facilities devoted to, or engage in or control, directly or indirectly, the operation of any water, ice, oil drilling and transportation business now conducted by Illinois Iowa Power Company;

7. That Illinois Iowa Power Company, a registered public utility holding company, shall sever its relationship with the companies named hereafter by disposing, or causing the disposition, in any appropriate manner not in contravention

of the applicable provisions of the said Act or the Rules and Regulations promulgated thereunder, of its direct and indirect ownership, control and holding of securities issued and properties owned, controlled or operated by the following companies:

Des Moines Electric Light Company
Iowa Power and Light Company
Illinois Terminal Railroad Company
Central Terminal Company
599 St. Louis Electric Terminal Railway Company;

and that Illinois Iowa Power Company shall cease to own or operate any property or facilities now owned or operated by it for the purpose of conducting, directly or indirectly, any water, ice, oil drilling and transportation business now conducted by it, and to cease engaging, directly or indirectly, in any water, ice, oil drilling and transportation business now engaged in by it; and

IT IS FURTHER ORDERED that the respondents, in accordance with Section 11(c) of the said Act, shall comply with
600 this order within one year from the date of its entry (without prejudice to their right to apply for additional time to comply with such order, as provided in such section).

Certain of the respondents in this proceeding which are registered public utility holding companies controlling or operating more than one single integrated public utility system, although heretofore afforded opportunity to indicate their choice of the single integrated system they desire to retain as their principal system, having failed to avail themselves of such opportunity, and the Commission desiring, nevertheless, that further opportunity be afforded such re-

spondents to indicate their views with respect to the choice of a principal system;

IT IS FURTHER ORDERED that notwithstanding the provisions of Rule XII(d) of the Commission's Rules of Practice, The North American Company, Northern Natural Gas Company, Illinois Traction Company, and Illinois Iowa Power Company may, within 15 days of the date hereof, petition for leave to present further argument and proffer additional evidence as follows:

602

1. The North American Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system, other than the integrated electric utility system of the Union group as described in our Findings and Opinion herein this day issued, shall serve as its principal system;

2. Northern Natural Gas Company may petition for opportunity to present further argument or additional evidence on the question whether the single integrated gas utility system operated by Argus Natural Gas Company, 603
rather than that operated by Peoples Natural Gas Company, shall serve as its principal system.

3. Illinois Traction Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system controlled or operated by any of its subsidiary companies, other than the major integrated electric utility system operated by Illinois Iowa Power Company, referred to in our Findings and Opinion herein this day issued, shall serve as its principal system.

4. Illinois Iowa Power Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system operated by it or any of its subsidiaries other than the major integrated electric utility system referred to in our Findings and Opinion herein this day issued, shall serve as its principal system.

Provided, however, that the Commission reserves the right to grant, deny or dispose of any such petition according
605 to the merits of the grounds urged in support thereof.

Issue having arisen in this proceeding as to the permissibility of retention of (a) the gas businesses conducted by Union Electric Company of Illinois, Iowa Union Electric Company, and St. Louis County Gas Company, in addition to the integrated electric utility system operated by Union Electric Company of Missouri and its subsidiaries; (b) the gas businesses conducted by Illinois Iowa Power Company, Kewanee Public Service Company, and Cahokia Manufacturers Gas Company, in addition to the electric operations of Illinois Iowa Power Company and Kewanee Public Service
606 Company; (c) the gas operations of Des Moines Electric Light Company and Iowa Power and Light Company, in addition to the electric operations of said companies; and (d) the securities of Cairo City Gas Company, Champaign and Urbana Gas Light and Coke Company, Danville Gas Light Company, Decatur Electric Company, The Jacksonville Gas Light & Coke Company, Jacksonville Railway and Light Company, and Venice Gas Company in the holding company systems of Illinois Traction Company and Illinois Iowa Power Company, and

The Commission deeming it necessary and appropriate that the record be reopened and that additional opportunity

be afforded for the presentation of further relevant evidence bearing on such questions;

IT IS ORDERED that, at such hour and place, and before such trial examiner and in such manner as the Commission shall by further notice and order designate, additional opportunity shall be afforded for the presentation of further relevant evidence bearing upon the question whether the gas businesses and securities referred to may be retained under clauses (A), (B), and (C) of Section 11(b)(1) of the Act as systems additional to the integrated electric utility systems of Union Electric Company of Missouri and its subsidiaries; Illinois Iowa Power Company and Kewanee Public Service Company; and Des Moines Electric Light Company and Iowa Power and Light Company, respectively. 608

Counsel for The North American Company having moved for a dismissal of this proceeding as to certain of its subsidiaries, named in our Order of March 8, 1940, commencing this proceeding, on the ground that they have been dissolved, or that The North American Company no longer has any interest in them, no objection having been made to this motion, and the Commission being of the opinion that the motion should be granted; 609

IT IS FURTHER ORDERED that this proceeding be, and the same hereby is, dismissed as to the following named respondents:

Washington and Glen Echo Railroad Company
St. Louis and East St. Louis Electric Railway Company
Wired Radio, Inc.
Wired Rediffusion Developments, Ltd.
St. Charles Electric Light and Power Company
Lakeside Light and Power Company

610 Wisconsin General Railway Company
Bloomington and Normal Railway, Electric and Heating Company
Decatur Light, Heat and Power Company
Elkhart Electric Light Company
Chicago and Electric Valley Railroad Company.

IT IS PROVIDED, with respect to our Findings, Opinion and Order herein, in their entirety, and with respect to the entry, publication, and service thereof, that they shall be without
611 prejudice to the right of the Commission to enter such other and further appropriate orders from time to time as the Commission may deem necessary to secure compliance by the respondents with the provisions of the Act and the pertinent rules and regulations thereunder in carrying out the provisions of this Order; and

IT IS FURTHER PROVIDED that jurisdiction is reserved to the Commission, notwithstanding this Order, or its entry, publication, and service, to conduct such investigations, hearings, or other proceedings involving any or all of the
612 respondents herein and to make such orders as it shall deem necessary or appropriate under Section 11(b)(2) or any other provision of the Public Utility Holding Company Act of 1935.

By the Commission.

IN THE MATTER

of

THE NORTH AMERICAN COMPANY

and its 614

SUBSIDIARY COMPANIES,

Respondents.

File No. 59-10

Public Utility Holding Company Act of 1935,
Section 11(b)(1)

PETITION OF RESPONDENT, THE NORTH AMERICAN COMPANY, FOR FURTHER ARGUMENT AND FOR LEAVE TO PROFFER ADDITIONAL EVIDENCE

In accordance with the Commission's order dated April 615
14, 1942 in this matter, The North American Company, a respondent herein, respectfully petitions for leave to present further argument, and to proffer additional evidence, with respect to the question whether any single integrated public utility system other than the integrated electric utility system of the group of companies designated in the above-mentioned order as the "Union Group", shall serve as this Respondent's principal system.

Further argument is requested for the following reasons:

(1) Section 11(b)(1) of the Act does not empower the Commission to enter an order designating a par-

616 ticular principal system for this Respondent, or compelling an election by this Respondent of a particular principal system prior to the expiration of the period within which the Commission's order of April 14, 1942 must be complied with.

(2) The sharp decline generally in the market value of securities and in the volume of trading therein, and particularly such decline with respect to public utility securities, since the record in this proceeding was closed, makes it imperative in the interest of investors in securi-
617 ties of this Respondent that this Respondent be given freedom of action, within the full period in which the Commission's order of April 14, 1942 must be complied with, to elect (as between the companies constituting the Union Group, The Cleveland Electric Illuminating Company and the group consisting of Wisconsin Electric Power Company and its subsidiaries) which of said systems is to constitute this Respondent's principal system. This is particularly true since it is impracticable now to determine which of the three large blocks of securities held by this Respondent in such companies may be most salable or best suited to exchange or other disposition at a future date. The Commission's order of April 14, 1942
618 should be reformed to permit such an election by this Respondent.

Leave is requested to proffer additional evidence with respect to the matters set forth in paragraph (2) above.

April 28, 1942.

File No. 59-10

Public Utility Holding Company Act of 1935,
Section 11(b)(1)

OPINION ON PETITIONS FOR REHEARING AND REARGUMENT

On April 14, 1942, we issued an opinion and order in these proceedings directing The North American Company 621 and certain of its subsidiary companies to take various steps in order to comply with the provisions of Section 11(b)(1) of the Public Utility Holding Company Act of 1935.[1] There are now before us petitions for rehearing, for leave to present further evidence and argument, and to set aside our order of April 14, filed by The North American Company, by Illinois Iowa Power Company, and by Northern Natural Gas Company. The first two of these petitions were filed on

[1] *The North American Company and Its Subsidiary Companies*, 11 S. E. C. ——— (1942), Holding Company Act Release No. 3405.

April 29, and the third on May 8, 1942.[2] We shall consider each, in turn.

I. Petition of The North American Company

In the course of the proceedings leading up to our opinion and order of April 14, and to aid us in issuing findings with respect to the maximum limits of the holding company system (*i.e.*, the single system, the additional systems, and the other businesses) which can be retained under the control
623 of North American, we called upon North American to indicate to us which, if any, of the integrated utility systems under its control it desired to retain as its "single integrated system" (commonly referred to as the "principal system").[3] It may very well be that the ultimate responsibility for designating the principal system rests with us, but in making that designation we would certainly give considerable weight to the expressed desires of the respondent holding company. And whether the choice must be made by the Commission or can be made by the holding company, a principal system had to be designated before we could make findings with respect
624

---

[2]The petition of Northern Natural Gas Company was supplemented, and in effect superseded, by an amended petition filed on May 27, 1942.

[3]In this and other proceedings the term "principal system" has been used to refer to the "single integrated public-utility system" mentioned in Section 11(b)(1). Under that section a registered holding company may retain the "single" system, such "additional" integrated systems as meet the standards of clauses (A), (B), and (C), and such "other businesses" as meet the standards of the section in relation to the retainable integrated utility systems. Because the "additional system" standards must be applied in relation to a "single" system and because the "other business" standards must be tested in relation to the retainable utility systems, the designation of at least the outlines of a "single" or "principal" integrated utility system is a necessary starting point.

to the "additional systems" and "other businesses" which might be retained by North American.[3a] We therefore made every effort to obtain from North American an expression of its views in this respect. North American insisted that it was not required to elect a principal system and it refused to make any such election or to indicate a definitive choice. North American's refusal in this respect was apparently based on its contention that it should be free to dispose of its non-retainable properties "as circumstances permit" without being "bound in advance to determine which system would be retained." We rejected that contention. Since at the time the record was closed it appeared clear that, if required to elect a principal system, North American would choose the electric utility properties of Union Electric Company of Missouri and its subsidiaries, and since we found that that choice was not inappropriate, we based our opinion and order upon the electric utility system of Union Electric and its subsidiaries as North American's principal system. However, our order outlined a procedure whereby North American was afforded a further opportunity to present additional argument or evidence, if it so desired, on the question whether any other integrated system under its control should serve as its principal system. Specifically, our order provided that, notwithstanding the provisions of Rule XII (d) of our Rules of Practice, North American might, within fifteen days of the date of the order, petition for leave to present further argument and evidence in this respect.

626

627

On April 28, 1942, North American filed a petition which in its introductory recital purports to be in response to the above-mentioned provision of our order. The petition states

---

[3a]North American specifically requested that we make such findings.

two specific reasons in support of the request for further argument. First, North American repeats its claim that, as a matter of law, no principal system need be designated prior to the expiration of the period within which our order of divestment must be complied with. Second, it urges that because of the state of the market for public utility securities, North American should be given freedom of action, "within the full period in which the Commission's order of April 14, 1942 must be complied with" to elect which of its three main systems (the Union group, The Cleveland Electric
629 Illuminating Company, and the group consisting of Wisconsin Electric Power Company and its subsidiaries) is to constitute its principal system. The petition also requests leave to offer additional evidence with respect to the second reason.

1. The petition, although it purports to have been filed in response to the opportunity afforded in our order of April 14 for further argument on the choice of a principal system, does not, in fact, relate to that question. In our order we provided specifically that, notwithstanding Rule XII (d) of our Rules of Practice,[4] within fifteen days of the order of
630 April 14, 1942,

> "The North American Company may petition for opportunity to present further argument or additional evidence on the question whether any single integrated public utility system, other than the integrated electric utility system of the Union group as described in our Findings and Opinion herein this day issued, shall serve as its principal system."

---

[4]This rule requires that petitions for rehearing be filed within five days of the order complained of.

The precise language of the order and the discussion in our opinion[5] make it plain that we were affording North American still one further opportunity within a fifteen-day period after the issuance of our opinion and order to state its choice of a principal system. It is clear, however, that North American's petition is not directed to that question but is, in effect, an attempt to reargue its claim that it need not make any choice.[6]

2. Since the petition is not a request for further argument in response to the specific provisions of our order of 632
April 14, 1942, it must be regarded as a general petition for rehearing and reargument. As such, it has not been filed in accordance with our Rules of Practice, which provide that:

> "Any petition for rehearing by the Commission shall be filed within five days after issuance of the order complained of and shall clearly state the specific grounds and the specific matters upon which rehearing is sought" (Rule XII (d)).

However, were we convinced that sufficient merit appeared in the petition, we would not hesitate to grant it in 633

[5]See Holding Company Act Release No. 3405, at pp. 11-13.

[6]Parenthetically, we may note that the position now taken by North American in its petition is somewhat inconsistent with the position taken by it in oral argument before us. Its counsel there insisted, as he does now, that North American is not required to choose a principal system. But he insisted on North American's right to make such a choice "as soon" as called upon to do so, and he stated further, "If the Commission tells me that we must, we will do it immediately." Our order of April 14, 1942, was, in effect, an accommodation designed to permit North American to indicate its position as it said it would "do . . . immediately" or "as soon" as called upon. North American now attempts to use this machinery to argue again that it need not make any election.

spite of the failure to comply with Rule XII (d). Our determination to deny is not based upon the petition's nonconformance with our Rules of Practice, but upon the simple fact that, as an independent petition, it merely seeks to have reargued a contention made, argued, fully considered, and disposed of, in the original proceedings. The request to have the record reopened to take evidence on the state of the market is apparently made on the theory that such evidence may in some way buttress this contention. But, in our view, particularly in light of the comments hereinafter made, evi-
635 dence of the state of the market has no bearing on the question.

3. No useful purpose would be served by further argument or a modification of our order upon the basis thereof. North American's claim is that it should be free, within the period in which our order must be complied with, to dispose of any of its three major systems as the market will permit. This position ignores the possibility of the other methods of divestment indicated in our original opinion. However, even if we were to assume that sales in the market were the
636 only available method, our order does not foreclose the possibility of any such sales as North American may wish to make in correlation with the market. Pursuant to our order, North American is required to dispose of the Cleveland and Wisconsin-Michigan companies, and nothing in our order forbids North American from disposing of the Union group at any time. If North American should desire to dispose of Union Electric, it will, of course, be free to seek our approval under the appropriate statutory provisions. Section 11(b) provides, in express terms, that the Commission "may by order revoke or modify any order previously made" under

Section 11(b) "if, after notice and opportunity for hearing, it finds that the conditions upon which the order was predicated do not exist." If North American can show that, by reason of subsequent events, including the disposition of Union Electric, "the conditions upon which the order was predicated do not exist," we have ample power to modify our order.

Thus, as matters now stand, if there is a showing of changed circumstances, we will have an opportunity to pass upon the propriety of any proposed modification of the plan 638
of integration which we have ordered. Under the type of order for which North American contends, the Commission would be giving its imprimatur to the propriety of any one of three alternative plans of compliance without knowing which, if any, of these plans will, in fact, be carried out. We find no reason or warrant in this case for adopting any such procedure.

North American's petition must, therefore, be denied.

* * * * * *

(Portions of the opinion relating to petitions by Illinois Iowa Power Company and Northern Natural Gas Company 639
have been intentionally omitted.)

An appropriate order will issue.

By the Commission (Chairman Purcell and Commissioners Healy, Pike, Burke, and O'Brien).

SUBSIDIARY COMPANIES,

Respondents.

File No. 59-10

Public Utility Holding Company Act of 1935, Section 11(b)(1)

642

ORDER DISPOSING OF PETITIONS FOR REHEARING AND REARGUMENT

The Commission having on April 14, 1942, adopted its findings, opinion and order in proceedings pending pursuant to Section 11(b)(1) of the Public Utility Holding Company Act of 1935 in the matter of The North American Company and Its Subsidiary Companies, Respondents, which, among other things, designated the respective single or principal integrated public utility systems of the several

holding companies in the holding company system of The North American Company; and

The said order having afforded an opportunity, notwithstanding the provisions of Rule XII (d) of the Commission's Rules of Practice, to The North American Company to request within fifteen days further argument or the presentation of additional evidence on the question whether any single integrated public utility system other than the integrated electric utility system of the Union group, denoting thereby the electric utility properties of Union Electric 644
Company of Missouri and its subsidiaries, shall serve as the "principal" system of The North American Company; and having, notwithstanding the said Rule of Practice, afforded to Illinois Iowa Power Company the opportunity to request within fifteen days further argument or the presentation of additional evidence on the question whether any single integrated public utility system operated by it or any of its subsidiaries, other than the major integrated electric utility system referred to in the said findings and opinion, shall serve as its principal system; and having, notwithstanding the said Rule of Practice, afforded to Northern Natural Gas 645
Company the opportunity to request within fifteen days further argument or the presentation of additional evidence on the question whether the integrated public utility system of Argus Natural Gas Company, Inc., rather than that operated by Peoples Natural Gas Company, shall serve as its principal system; and

The North American Company and Illinois Iowa Power Company, having on April 28, 1942, petitioned for leave to present further argument and additional evidence upon certain matters; Northern Natural Gas Company, having on

646 *Order Disposing of Petitions for Rehearing and Reargument*

May 8, 1942, petitioned for leave to reopen the proceedings with respect to it and its subsidiaries, which petition was amended on May 27, 1942; the Commission having considered the petitions and being fully advised in the premises, and having this day issued its opinion with respect to the issues raised by said petitions:

IT IS ORDERED, for the reasons set forth in the said opinion, that the said petitions be, and the same hereby are, denied, except insofar as hereinafter set forth:

647 The petition of Illinois Iowa Power Company having indicated the existence of evidence respecting the retainability of certain oil drilling facilities owned by the company, which evidence was not before the Commission in the course of the original proceedings herein, and the Commission in its discretion deeming it advisable to afford to Illinois Iowa Power Company an opportunity to present such evidence for inclusion in the record herein; and

The petition of Northern Natural Gas Company having indicated the existence of evidence respecting the retain-
648 ability of certain pipe line facilities owned by its subsidiary, Argus Natural Gas Company, Inc., which evidence was not before the Commission in the course of the original proceedings herein, and the Commission in its discretion deeming it advisable to afford to Nothern Natural Gas Company an opportunity to present such further evidence for inclusion in the record herein;

IT IS FURTHER ORDERED that the record be reopened and a hearing convened at a date to be set by further order of the Commission for the limited purpose of receiving such evidence as Illinois Iowa Power Company and Northern Natural

Gas Company may proffer with respect to the retention and operation of said oil and pipe line facilities, respectively, and the evidence to be introduced shall be limited to those issues, as more fully set forth in the said opinion.

By the Commission.

File 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY AND
ITS SUBSIDIARY COMPANIES.

656

Hearing Room 1102,
Securities and Exchange Commission Building,
Washington, D. C.,
Friday, June 7, 1940.

Met, pursuant to notice, at 10 o'clock a. m.

Before: WILLIAM W. SWIFT, *Trial Examiner.*

657

Appearances:

RALPH C. BINFORD, ESQ., appearing on behalf of the Securities and Exchange Commission.

JOHN C. BRUTON, JR., and

CHARLES S. HAMILTON, JR., of Sullivan and Cromwell, New York, N. Y., for respondent.

LLOYD B. HARRIS, ESQ., appearing on behalf of the Public Utilities Commission of the District of Columbia.

658 *Colloquy*

PROCEEDINGS.

The Examiner: This hearing ordered to be convened pursuant to Section 11(b)(1) of the Public Utility Holding Company Act of 1935, is now convened.

Have the appearances of the parties been entered?

Mr. Binford: Ralph C. Binford for the Commission.

Mr. Bruton: Sullivan & Cromwell by John C. Bruton, Jr. and Charles S. Hamilton, Jr., for the respondent, the
659 North American Company and subsidiaries.

The Examiner: At this point I would like to make inquiry if there is any member of the public present this morning desiring to be heard, any investor, any consumer, or any representative of any public utilities commission; if so, you will make yourself known.

Mr. Harris: Lloyd B. Harris. I represent the Public Utilities Commission of the District of Columbia. We have filed a petition for intervention and were granted the right to intervene in this proceeding. I am associated with Elwood H. Seal, General Counsel for the Public Utilities Com-
660 mission.

The Examiner: Very well, the record will show that appearance. The record will also show that with that exception no other person has answered my inquiry.

Now, what have you to present first, gentlemen?

Mr. Binford: Mr. Examiner, this proceeding is one under

—2—

Section 11(b)(1) of the Public Utility Holding Company Act of 1935, directed against the North American Company, a registered holding company, and its subsidiaries.

Numerous answers have been filed and also certain petitions for intervention.

The hearing was originally set for an earlier date, but by order of the Commission it was set at this date and this hour.

I understand, however, that the principal respondent, the North American Company, has a motion relative to a continuance of the hearing to present at this time, before we proceed with the substance of the hearing.

Mr. Bruton: Mr. Examiner, in response to Mr. Binford's 662
statement, there is now pending before the Commission a motion by the respondent that this proceeding be adjourned subject to the further order of the Commission and that the proceeding be held in abeyance.

The grounds upon which that motion is based are fully stated in the motion. A brief accompanying the motion and in support thereof has also been filed with the Secretary of the Commission.

I suggest that it would be improper to continue with the hearing until the motion has been passed upon by the Commission and I suggest therefore that the hearing at this 663

—3—

time be adjourned subject to the determination by the Commission on the motion which I have referred to.

Mr. Binford: Mr. Examiner, this motion was not filed until this morning and it was accompanied by a written brief. Counsel for the Commission is not authorized at this time to consent to a continuance or postponement of this hearing beyond this date. However, I would be willing to consent to and would request the examiner for a recess at this time until 2 o'clock this afternoon in order that the fil-

664 *Colloquy*

ing of this motion and brief might be made known to the Commission, and, if they see fit, authority granted to me to consent to a further adjournment to a definite date or until the motion has been fully considered and passed upon.

I therefore suggest we recess, if it pleases the Examiner and counsel, until 2 o'clock this afternoon.

The Examiner: Off the record.

(Discussion off the record.)

665 Mr. Bruton: I object to the request made by Mr. Binford that the hearing be adjourned only until 2 o'clock and I renew my request that the hearing be adjourned at this time subject to the action by the Commission on the motion which I have referred to.

The Examiner: I do not feel justified in granting the

—4—

whole of your application. I think in fact the Commission will have to act on your motion for the continuance and I think that we should recess this matter until 12 o'clock in order that some word may be had from the Commission

666 as to just what action we shall take with respect to your motion.

I therefore recess this matter until 12 o'clock.

Mr. Bruton: I respectfully except to the ruling.

The Examiner: The record will note the exception.

(Thereupon, at 10:15 o'clock a.m., a recess was taken until 12 o'clock noon.)

667

AFTER RECESS.

Met, pursuant to the taking of the recess, at 12 o'clock noon.

The Examiner: The hearing will be resumed.

Since the recess was taken I have word from the Commission that the motion filed by North American Company for an indefinite adjournment was denied by the Commission. The Commission, however, authorized an adjournment of the hearing for a period of two weeks until June 21, 1940, at 10 o'clock a. m.

668

Mr. Bruton: I wish formally to record an exception to the ruling of the Commission and to reserve the right to request a re-hearing on the motion.

—5—

The Examiner: Very well, your exception and request will be noted in the record.

Mr. Bruton: I also wish to reserve the right to request oral argument before the Commission on the motion, if that may be done in connection with any request for rehearing——

669

The Examiner: I suggest, Mr. Bruton, you put that in the form of writing to the Commission and the Commission will act on that request when it comes in.

Mr. Bruton: I am not making any request at the present time, Mr. Examiner; I am merely reserving formally the right to make such request if it should be deemed desirable.

The Examiner: The record will show the reservation you are making.

670 *Colloquy*

If there is nothing else, this matter is now continued until 10 o'clock a. m., June 21, 1940.

(Thereupon, at 12:10 o'clock p. m., the hearing was adjourned, until June 21, 1940, at 10 o'clock a. m.)

Appearances:

RALPH C. BINFORD, Esq., appearing on behalf of the Securities and Exchange Commission.

S. PEARCE BROWNING, Esq., JOHN J. BRUTON, JR., Esq., and CHARLES S. HAMILTON, JR., Esq., of Sullivan and Cromwell, New York, N. Y., appearing on behalf of the respondent.

676 *Colloquy*

PROCEEDINGS

The Examiner: The hearing will be resumed. I believe Mr. Browning has joined counsel representing the North American Company and its subsidiary companies since the last hearing which was held on June 7th. .

Mr. Browning: That is correct.

The Examiner: The record will show that. Now at the last session on June 7th I made inquiry if any member of
677 the public was present desiring to be heard and I believe there was one response to that, an intervention by the Public Service Commission of Washington.

Are there any other parties here this morning desiring to be heard? (After a pause.) I hear no response and the record will so show.

All right, gentlemen, you may proceed.

Mr. Binford: Mr. Examiner, I would like to state at this time that a motion for dismissal of this proceeding was filed on the 18th by the respondent, the North American Company, and that motion was denied yesterday, the 20th, by
678 the Commission.

Later during the day I will offer in evidence a copy of that motion and a copy of the order denying the same.

Mr. Browning: And we would like to have the record show we have an exception to that order of the Commission, Mr. Examiner.

—8—

The Examiner: Yes, the record will note your exception.

Mr. Binford: The nature of this proceeding was stated to the Examiner at the first hearing.

679

At this time I offer in evidence as Commission's Exhibit No. 1 in evidence a notice and order for hearing entered March 8, 1940, constituting Holding Company Act Release No. 1960, dated March 9, 1940.

That portion of this order which is particularly designated as a notice in the body of the order was published in the Federal Register, Volume V, No. 49, page 1026, on Tuesday, March 12, 1940, which I have verified by personal inspection of the Federal Register of that date.

680

Mr. Browning: No objection.

The Examiner: The order referred to is received as Commission's Exhibit No. 1.

(The document referred to was marked Commission's Exhibit No. 1 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 2 I offer in evidence Holding Company Act Release No. 1959 which likewise recites the institution of the proceeding and which was released to the press by this Commission.

The Examiner: Let that come in as Commission's Exhibit No. 2.

681

Mr. Browning: No objection.

—9—

(The document referred to was marked Commission's Exhibit No. 2 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 3 I offer in evidence certain United States registered mail return receipts which are filed in and attached to the original docket in this case and which are numbers 977,000 to 977,028 in-

682 *Colloquy*

clusive, and numbers 977,926 to 977,999 inclusive, except numbers 977,982, 977,983 and 977,984, and as to the last three numbered registered mail articles which were addressed to Wisconsin General Railway Company, Motor Transport Company and Badger Auto Service Company, respectively, in care of their immediate parent, Wisconsin Electric Power Company.

I offer in evidence envelopes likewise incorporated in the original record showing the same to have been returned, all
683 for the purpose of showing notice to the parties to this proceeding.

The Examiner: Is there any objection to these letters and the postal receipts being introduced?

Mr. Browning: No objection whatever, Mr. Examiner, except that I wonder as to the necessity of burdening the record with them. Would it meet Mr. Binford's purposes if we stated for the purposes of the record that each respondent had received such notice of the hearing, of the proceeding rather.

—10—

684 Mr. Binford: Do you make that as counsel for all respondents?

Mr. Browning: Yes.

Mr. Binford: That would be perfectly acceptable to me, in which case I withdraw the proffered exhibit in view of the stipulation.

The Examiner: All right, the stipulation will be noted.

Mr. Binford: At this time I would like to stipulate with counsel that all documents which are part of the official files of the Commission may remain attached to those files and not be attached to nor copied into this particular record.

685

That is to say all such documents which are introduced and received in evidence, and in the event of court review certified copies or photostatic copies may be used in lieu of the originals. Is that satisfactory?

Mr. Browning: No objection.

The Examiner: Very well, that stipulation, as you gentlemen have stated it, will be noted and followed.

Mr. Binford: As Commission's Exhibit No. 3 I offer in evidence an order of the Commission of April 17, 1940, deferring the hearing in this matter from the date originally 686
set to June 7, 1940, which order as I have verified by personal inspection was published in Federal Register Volume V, No. 77, page 1458 on Friday, April 19, 1940. This is a part of

—11—

the original docket in this case.

The Examiner: That order is received as Commission's Exhibit No. 3.

(The document referred to was marked Commission's Exhibit No. 3 and received in evidence.)

687

Mr. Binford: As Commission's Exhibit No. 4, I offer in evidence Holding Company Act Release No. 2018 released to the press by this Commission under date of April 18, 1940, giving notice of the postponement of the hearing as originally set.

The Examiner: That is received as Commission's Exhibit 4.

(The document referred to was marked Commission's Exhibit No. 4 and received in evidence.)

688 *Colloquy*

Mr. Binford: In making that offer I wish to restrict the offer to the first two full paragraphs of the notice since the remainder of the notice of press release refers to other matters.

The Examiner: Very well. This release is received only in so far as it concerns matters involved in this hearing.

Mr. Binford: As Commission's Exhibit No. 5, I offer in evidence a letter purporting to be accompanied by a copy of the original notice and order for hearing entered in this
689 case with an attached memorandum showing the names of

certain public regulatory bodies and mayors of certain cities as to whom notice and the covering letter were mailed, together with an endorsement on the memorandum and the letter showing the mailing of the same.

I understand that counsel for the respondents will stipulate that in the letters as mailed a copy of the notice and order was included.

Mr. Browning: That is correct.

The Examiner: All right, the letter with the memoran-
690 dum is received as Commission's Exhibit No. 5.

(The document referred to was marked Commission's Exhibit No. 5 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 6 I offer in evidence original order of the Commission dated June 5, 1940 designating the Trial Examiner presently presiding in this matter.

Mr. Browning: No objection.

The Examiner: That order is received as Commission's Exhibit No. 6.

691

(The document referred to was marked Commission's Exhibit No. 6 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 7 I offer in evidence the original order of the Commission dated June 7, 1940 denying a certain motion filed on behalf of the re-

—13—

spondent, the North American Company, but adjourning the hearing set for that day in this matter to the present date.

Mr. Browning: No objection. Of course it is of record 692
that we have an exception.

The Examiner: Yes, that is already of record, but it is well to get it in here, I think.

The order is received as Commission's Exhibit No. 7.

(The document referred to was marked Commission's Exhibit No. 7 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 8 I offer in evidence the caption and last paragraph of Holding Company Act Release No. 2097 which was released to the press by this Commission under date of June 7, 1940, and which 693
gives public notice of the deferring of the hearing set for that date to the present date.

The Examiner: That particular part of Release 2097 is received as Commission's Exhibit No. 8.

(The document referred to was marked Commission's Exhibit No. 8 and received in evidence.)

Mr. Binford: Mr. Examiner, at this point counsel for the Commission proposes to offer in evidence certain dockets of

694 *Colloquy*

the Commission consisting of data filed by the respondent, the North American Company, and by subsidiaries of that company which are also respondents in this proceeding.

—14—

In offering these exhibits counsel for the Commission does not vouch for the accuracy of any particular statements therein contained, but does vouch for the fact the dockets so introduced are part of the original files of the Commission and were filed with the Commission by the parties indicated
695 in the text of the respective exhibits all of whom are parties to this proceeding.

These dockets present a general factual survey of the North American Holding Company System, including the sub-holding company systems within that System. It is recognized the data contained in these reports may vary in the degree of its relevancy to the issues here involved.

While counsel for the Commission takes the position that all the matter contained in these dockets is relevant to the broad issues presented in this proceeding, yet we are willing to stipulate that any party to this proceeding may at any
696 appropriate time during the course of the proceeding object to the materiality or relevance of any particular portions of these exhibits.

Counsel for the Commission is willing to stipulate further that in the event of any appeal from any order of the Commission or in the event of court review there may be omitted from the record such portions of these dockets as may be immaterial or may be determined to be immaterial by the Examiner or the Commission.

—15—

These dockets comprise the so-called U5B or registration statements filed by the North American Company.

Included in each U5B docket as the first instrument in each case is the notice of registration by each particular holding company registered under the Act with this Commission, and thereby becoming a registered holding company.

The additional dockets comprise the so-called U5S statements which are statements filed annually with the Commission to bring up to date the information contained in the original registration statement. 698

Now these dockets, as the Examiner may see, are very voluminous. I would like to state as briefly as I can the general contents so that the relevancy may be determined.

The Examiner: Before you get to a description of the contents let us see if the respondents are willing to stipulate with you about the introduction of these documents.

Don't you think that it is well to see if they care to agree to your stipulation?

Mr. Browning: We would like to be heard on that point, Mr. Examiner.

The Examiner: All right. 699

Mr. Hamilton: Mr. Examiner, we object to the manner in which the exhibits are to be offered. It seems to me to be an unheard of principle that a party to a proceeding can offer exhibits without being bound by the recitals in them.

—16—

If the Commission wants to take the time to sit down and examine these exhibits and determine now what portions are deemed relevant and what portions they wish to rely on, we will be glad to sit down with Commission counsel and go through the entire collection of volumes, but it seems highly

700 *Colloquy*

improper to us that the exhibits should be offered with a complete reservation on the part of Commission's counsel that he is not bound by the exhibits which he himself is offering even though he has stated that any party may subsequently object to the relevancy of any portion of the exhibits offered.

It seems to me that is entirely improper procedure.

The Examiner: We will go off the record at this point.

(Discussion off the record.)

701

The Examiner: On the record.

Mr. Browning: Since there may be some misunderstanding of the Commission's position we request that counsel for the Commission restate the Commission's position regarding these exhibits which are to be offered.

Mr. Binford: In the first place of course the position I am stating is the position of counsel for the Commission and not a determination of the Commission itself. It is my position in this particular case——

—17—

702 Mr. Browning (interposing): Will you read that statement of Mr. Binford's?

(The reporter thereupon read the statement as recorded.)

Mr. Browning: It isn't your personal view. You are presenting the case for the Commission and you are offering the exhibits for the Commission.

Mr. Binford: Yes, but my position is as attorney and not as Trial Examiner and I am not making the determina-

tion of the Commission of what the ultimate conclusion will be.

Mr. Browning: Yes.

Mr. Binford: As I endeavored to state before the position of counsel for the Commission in respect to these dockets which I have described which I propose in a few moments to offer in evidence is that every item of information set forth in the dockets is relevant and material, possibly to varying degrees, in the determination of the issues in this case, which are very broad. 704

Failure of opposing counsel to object at this time to any particular items will not be used by counsel for the Commission at a later and appropriate time during the course of the proceedings——

The Examiner (interposing): Or considered as a waiver.

—18—

Mr. Binford: Or considered as a waiver of the right to object or move to strike any of the material contained and which may be so received in evidence.

I also stated while counsel for the Commission vouched for the fact that these are official public documents on file 705 with this Commission and further vouched for the fact that they were filed with the Commission by the persons by whom they purport to have been filed all of whom are parties to this case, we can not vouch for the accuracy of the particular individual statements made by these parties who are present or represented.

We vouch merely for the official character of the instrument and for the persons by whom they were filed and we assert their relevancy and materiality. Does that satisfy counsel?

706 *Colloquy*

Mr. Browning: I should like to make a further statement regarding the understanding, first as to the question of relevancy and materiality we understand that the Commission is offering these exhibits in their entirety and that counsel for the respondents are offered an opportunity to object subsequently to the relevancy or materiality.

Mr. Binford: These dockets will not be offered in their entirety. They will be offered separately as to particular documents which, however, may consist of several volumes.

707 —19—

Mr. Browning: I meant, Mr. Binford, the items which you did offer. I do not see that we have any objection on that score provided that we have a reasonable time to examine the documents offered as to their relevancy so that we will know what the Commission's case is. I do not want to get ahead of Mr. Binford on his own case, but if he intends to rest after offering these statistical exhibits I submit that we should have a reasonable opportunity to consider the exhibits which have been offered.

For example, Mr. Examiner, if we feel we wish to make
708 a motion to dismiss after the Commission rests we must necessarily as a preliminary step go over the Commission's case very carefully.

Accordingly, I submit that as to the first point we are entitled to a reasonable time to go over the material which is offered this morning.

The Examiner: Have you any objection to that, Mr. Binford?

Mr. Binford: I think that that is a little premature. After these instruments are offered in evidence then the

709

question of examination might be brought up, or the question of a recess for a reasonable length of time.

Incidentally I might point out all this material was furnished by the respondents and none was furnished by the Commission.

—20—

The Examiner: If this is received under the statement that you have made in offering it I think the respondents ought to have a reasonable time to examine it thoroughly and interpose any objections as to the relevancy and the competency of it.

710

Mr. Binford: I made no limitation in my statement.

The Examiner: I didn't understand you to.

Mr. Browning: If I may say something there, Mr. Examiner, perhaps Mr. Binford is right that since he gives us all the time we want in effect to make any objections as to relevancy, that the question at the close of his case as to how much time we would require to go over his case should be taken up then.

I think I can agree with him on that point.

711

As to the second question presented, the so-called vouching for the exhibits, in general, when a party offers evidence he offers it either for all purposes or the truth of the facts therein stated or he makes a more limited offer to show his adverse state of mind, in which case he may not be bound by the facts therein stated.

As I understand this offer, the exhibits are offered for the facts therein stated and we submit that they must be offered without any reservations as to the exhibits themselves.

712 *Colloquy*

This is a question of law as to which we could file a brief subsequently with the Examiner, but I can refer imme-

—21—

diately to one case. That is the case of Snell Isle versus the Commissioner of Internal Revenue, 90 Federal (2nd) 481 (1937), in which the court states the general rule to be that the party introducing a document in evidence is bound by its recitals for all purposes.

Accordingly, we submit that the offer should be for all

713 purposes.

The Examiner: Have you any further comment to make, Mr. Binford?

Mr. Binford: Yes, I have. I think I ought to refer very briefly for the sake of the record to the general contents and general things shown by these dockets.

The Examiner: Now the question that we are immediately concerned with is whether these documents could be received without reservation.

Mr. Binford: There is no motion or exception or objection presently pending before the Examiner.

714 The Examiner: There was one just made by Mr. Browning.

Mr. Binford: It was merely a comment on the method of presentation.

The Examiner: I interpreted it as an objection.

Mr. Binford: I have made no offer as yet.

The Examiner: You propose to offer it and I think that is the clear import of your position.

Mr. Binford: Before I do that I would like to conclude

—22—

my statement as to what I am going to offer, if I may.

715

The Examiner: All right, you may do that.

Mr. Binford: I make this statement for the sake of having a brief summary in the record.

The U5B dockets which contain as the first instrument, as I have said before, the signed registration and notice of registration of the holding company filing the report whereby it becomes a registered holding company, then the U5B contains general descriptive matter relative to the system.

The first three items identify the company filing the statement and accounting officer filing the statement.

716

Item 4 is a list of the companies in the system showing the type of their organization, state of organization and type of business they are in.

Item 5, there appears a brief description of the general character of the business of the companies in the system. This item includes a map showing service areas and their extension across state boundaries of direct public utility subsidiary companies; list of companies outside the system from whom electricity is purchased and/or with whom electric current is interchanged; a list of companies from whom gas is purchased; a tabulation of volume of electric energy and

717

gas transactions of the so-called public utility subsidiary

companies; number of communities served retail and wholesale; estimate of the aggregate population of communities receiving service from the so-called public utility subsidiaries.

When I say so-called I mean public utility companies as defined in the particular act under which this proceeding has been instituted.

718 *Colloquy*

A statement of the principal cities in which electricity and gas is distributed; tabulation of the number of electric customers; the annual sales of electricity in kilowatt hours as well as the revenue from such sales for the period covered; a similar tabulation showing corresponding material with regard to the number of active gas meters and the annual gas sales in thousands of cubic feet throughout the gas service area.

There is also a tabulation of similar material with regard
719 to transportation, heating, water and other non-utility business in the sense of the Act.

Item 6 describes briefly the general character and location of the principal plants and properties of the companies in the system and indicate whether such plants are units or owned in fee or held in some other way.

Item 8 includes a description and statement of the securities outstanding in the reporting system, shows the issues and series of funded debt within the system.

—24—

Item 8 b shows each class of capital stock of companies
720 within the system including certificates of beneficial interest outstanding.

Item 10 gives a tabulation of the investments of the companies in the system in other companies which are in parts of the system.

Item 11 a shows indebtedness of each company to associate companies where the debt exceeds a certain amount, $25,000 or an amount greater than 2 per cent of the debit accounts on the balance sheet of the debtor.

Item 13 shows securities sold during the five years preceding the end of the accounting period covered by the report

which varies as to the U5S statements and U5B statement. It also includes the principal underwriters involved in such flotation.

Item 15 is list of the 20 largest stockholders of each class of stock of the reporting company.

Item 16 a shows the officers and directors of each company including obviously the interlocking directors, if such exist, and indicates the rate of compensation for each director whose aggregate compensation from all companies exceeds $1,000 per year; the annual salary of each whose aggregate 722
compensation is at the rate of $20,000 or more per year.

Item 16 b shows all regular employees who are not officers or directors, but whose aggregate annual rate of compensa-

—25—

tion is $20,000 a year or more.

Item 16 c shows the indebtedness of directors, trustees or officers within the system and companies in the system where the total liability is in excess of a stated sum.

Item 16 d describes briefly the nature of any contract whereby any director, trustee or officer has a contract with any company which provides for compensation or any con- 723
tract between any company and another of whose voting securities an officer owns directly or indirectly 5 per cent or more, or contracts with companies in which the officers and directors on the one hand have beneficial interest in the other contracting party.

Item 16 e shows connections of the directors, trustees and officers with banks and other financial houses.

Item 18 lists services, sales and construction contracts.

Several exhibits follow items in these statements.

724 *Colloquy*

Exhibit A is a corporate chart of the system giving a graphic picture of its inter-relations, indicating the percentage of voting securities owned within the system.

Exhibit B comprises copies of the charters, trust agreements and other fundamental documents of the organization as well as copies of the by-laws of the various companies in the system.

Exhibit C comprises copies of the indentures and other

—26—

725 fundamental documents showing the financial interlocking of properties by reason of mortgage liens and pledges.

Exhibit D contains financial statements of the system companies.

Exhibit E contains maps showing the service areas for electricity and gas. The electric map shows generating plants and transmission lines including physical interconnections; sub-stations and distribution from sub-stations; points of interconnection with other electric utility companies.

The gas map shows similar data with respect to gas

726 properties operated.

These maps also indicate capacity and kinds of plants, voltage and size of lines and the names of other utilities with whom interconnection is presently made and other material indicating a physical description of the properties of the company which is highly relevant in this case.

Exhibit F contains copies of annual reports to stockholders of system companies.

Exhibit G contains copies of annual reports filed with the state commissions and in certain instances the reports submitted to the Federal Power Commission.

727

Exhibit H contains confirmations of sales, services and construction contracts.

In other words these dockets give the respondent's own

—27—

over-all picture of the system and its properties, physical connections and general operations.

Now the first of these substantive exhibits I now offer in evidence as Commission's Exhibit No. 9, the U5A and U5B statements of North American Company which is Commission File No. 30-73, and which is in 26 volumes which I suggest be marked for convenience Commission's Exhibits 9-A through Z inclusive.

728

The Examiner: We will have a recess.

(Short recess.)

The Examiner: You may proceed.

Mr. Browning: If the Examiner please, I should like the record to show that the exhibits offered would require approximately five feet of shelf space and that we have had no opportunity here today to do more than make the roughest sort of check as to what the volumes contain.

729

We still desire to press our objection to the admission of this material with the reservation which the Commission counsel has proposed.

In other words, we feel that if the material is offered by Commission's counsel it should be offered for all purposes.

The Examiner: Bearing in mind what you have just said as well as the comments of you gentlemen before the formal offering of these volumes I have reached this conclusion:

—28—

730 *Colloquy*

The material in these volumes is received in evidence subject to your right to object at some later date to its admissibility on the ground of relevancy and subject further to your right to examine it more particularly than you have done so far.

Now as to the matter of whether the Commission is bound by the data in these volumes and whether it vouches for the data is another matter which I reserve ruling on and will await the brief that you mention in your objection.

Mr. Hamilton: May I ask, Mr. Examiner, if we are also
731 privileged to object on the ground of immateriality?

The Examiner: Yes, that is a ground for objection also.

The dockets described will be received as Commission's Exhibits 9-A to 9-Z inclusive.

(The documents referred to were marked Commission's Exhibits Nos. 9-A to 9-Z, inclusive, and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 10 I offer in evidence the so-called U5S statements of the North American Company constituting a supplemental registration state-
732 ment for the year 1937, which is in 12 volumes and is designated No. 30-73-2, and I suggest that these 12 volumes be respectively designated as Commission's Exhibits 10-A

through L inclusive for convenience.

Mr. Browning: May it be understood that we make the same objection and the same ruling applies to this exhibit?

The Examiner: Yes. I make the same ruling and the record will show you are making the same objection which you did to the Exhibits 9-A through 9-Z.

733

(The documents referred to were marked Commission's Exhibits Nos. 10-A to 10-L, inclusive, and received in evidence.)

Mr. Browning: I don't want to delay the hearing by making the same objection and same reservation each time, Mr. Examiner, that Mr. Binford offers an exhibit, so if we could agree on all these statistical exhibits at the end I could secure an exception.

Mr. Binford: It is so stipulated.

734

The Examiner: Very well.

Mr. Binford: As Commission's Exhibit No. 11 I offer in evidence the North American Company U5S or supplemental registration statement for the year 1938 which is in 13 volumes, and I suggest that they be successfully designated as Commission's Exhibits 11-A through 11-M inclusive.

The Examiner: All right, those 13 volumes are received in evidence under the numbers which you have mentioned subject to the objection and reservation which counsel for respondents entered.

735.

—30—

(The documents referred to were marked Commission's Exhibits Nos. 11-A to 11-M, inclusive, and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 12 I offer in evidence the North American Company U5S statement for the year 1939 which is presently in 12 volumes which I suggest be designated consecutively as Commission's Exhibits 12-A through 12-L.

736 *Colloquy*

The Examiner: That will be done.

(The documents referred to were marked Commission's Exhibits Nos. 12-A to 12-L, inclusive, and received in evidence.)

Mr. Binford: At this time, may it please the Examiner, it is my understanding that certain additional material which is part of the statement for the year 1939 has not yet been filed by the North American Company with this
737 Commission, and it may amount to two or three volumes.

I would therefore like at this time to reserve Exhibits 12-M, 12-N and 12-O when it is filed.

The Examiner: All right, that reservation will be made.

(Commission's Exhibit Nos. 12-M, 12-N and 12-O, respectively, were reserved for the documents referred to, same to be furnished later.)

Mr. Binford: As Commission's Exhibit No. 13 I offer

—31—

738 in evidence the U5A and U5B registration statements filed with this Commission by the respondent Union Electric Company of Missouri which is Commission's File No. 30-177-1.

Union Electric Company of Missouri being a sub-holding Company in the North American holding company system.

The Examiner: All right, let that come in as Commission's Exhibit 13.

(The document referred to was marked Commission's Exhibit No. 13 and received in evidence.)

739

Mr. Binford: As Commission's Exhibit 13-A I offer in evidence the U5S supplementary registration statement of Union Electric Company of Missouri for the year 1937.

The Examiner: All right, that is received under Exhibit No. 13-A.

(The document referred to was marked Commission's Exhibit No. 13-A and received in evidence.)

Mr. Binford: As Commission's Exhibit 13-B I offer the similar statement of the same company for the year 1938. 740

The Examiner: All right, let that come in as Exhibit 13-B.

(The document referred to was marked Commission's Exhibit No. 13-B and received in evidence.)

—32—

Mr. Binford: As Commission's Exhibit 13-C I offer the similar statement of the same company for the year 1939.

The Examiner: All right, that is received as Exhibit 13-C.

(The document referred to was marked Commission's Exhibit No. 13-C and received in evidence.) 741

Mr. Binford: As Commission's Exhibit No. 14 I offer in evidence U5A and U5B statements of Washington Railway and Electric Company another respondent and sub-holding company in the North American Holding Company System, which is Commission File No. 30-162-1.

The Examiner: That is received as Commission's Exhibit 14.

(The document referred to was marked Commission's Exhibit No. 14 and received in evidence.)

742 *Colloquy*

Mr. Binford: As Commission's Exhibit No. 14 I offer in evidence the U5S or supplemental statement of the same company for the year 1937.

The Examiner: All right, that is received as Commission's Exhibit 14-A.

(The document referred to was marked Commission's Exhibit No. 14-A and received in evidence.)

743 Mr. Binford: As Commission's Exhibit 14-B I offer in

—33—

evidence a similar statement of the same company for the year 1938.

The Examiner: Let it come in under Exhibit No. 14-B.

(The document referred to was marked Commission's Exhibit No. 14-B and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 14-C I offer in evidence a similar statement of the same company for the year 1939.

744 The Examiner: All right, it is received under the number which he has given it.

(The document referred to was marked Commission's Exhibit No. 14-C and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 15 I offer in evidence the U5A and U5B registration statements of Illinois Traction Company a respondent in this proceeding, and a registered holding company of the North American Company System, which bears Commission's File 30-79-1.

745

The Examiner: All right, let that be received as Commission's Exhibit 15.

(The document referred to was marked Commission's Exhibit No. 15 and received in evidence.)

Mr. Binford: As Commission's Exhibit 15-A I offer in evidence the U5S or supplemental registration statement of the same company for the year 1937.

—34—

746

The Examiner: All right, so received.

(The document referred to was marked Commission's Exhibit No. 15-A and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 15-B I offer in evidence a similar statement of the same company for the year 1938.

The Examiner: All right, it is received under the number mentioned.

(The document referred to was marked Commission's Exhibit No. 15-B and received in evidence.)

747

Mr. Binford: As Commission's Exhibit No. 15-C I offer in evidence a similar statement of the same company for the year 1939.

The Examiner: All right, that is received as Commission's Exhibit 15-C.

(The document referred to was marked Commission's Exhibit No. 15-C and received in evidence.)

748 *Colloquy*

Mr. Binford: As Commission's Exhibit No. 16 I offer in evidence the U5A and U5B registration statements of North American Light and Power Company, a respondent in this proceeding, a registered holding company and a sub-holding company in the North American system bearing file No. 30-78-1 of this Commission.

The Examiner: That is received as Commission's Exhibit 16.

—35—

749 (The document referred to was marked Commission's Exhibit No. 16 and received in evidence.)

Mr. Binford: As the Commission's Exhibit 16-A I offer in evidence the U5S or supplementary registration statement of the same company for the year 1937.

The Examiner: All right, received under the number mentioned.

(The document referred to was marked Commission's Exhibit No. 16-A and received in evidence.)

750 Mr. Binford: As the Commission's Exhibit 16-B I offer in evidence a similar statement by the same company for the year 1938.

The Examiner: All right, it is received under the number which you have mentioned.

(The document referred to was marked Commission's Exhibit No. 16-B and received in evidence.)

Mr. Binford: As the Commission's Exhibit No. 16-C I offer in evidence a similar statement for the same company for the year 1939.

751

The Examiner: All right, it is received as Commission's Exhibit 16-C.

(The document referred to was marked Commission's Exhibit No. 16-C and received in evidence.)

—36—

Mr. Binford: As the Commission's Exhibit No. 17 I offer in evidence U5A and U5B statements of the respondent Illinois-Iowa Power Company, a registered holding company and a subsidiary under the Act in the North American system which bears Commission's File No. 30-176-1.

752

The Examiner: All right, that is received as Commission's Exhibit 17.

(The document referred to was marked Commission's Exhibit No. 17 and received in evidence.)

Mr. Binford: As the Commission's Exhibit No. 17-A I offer in evidence the U5S supplementary registration statement of the same company for the year 1937.

The Examiner: Let that come in under the number mentioned.

753

Mr. Binford: As Commission's Exhibit No. 17-B I offer in evidence a similar statement by the company for the year 1938

The Examiner: All right, that is received as Commission's Exhibit 17-B.

(The documents above referred to were marked Commission's Exhibits Nos. 17-A and 17-B, respectively, and received in evidence.)

754 *Colloquy*

Mr. Binford: As Commission's Exhibit No. 17-C I offer in evidence a similar statement by the same company for the year 1939.

—37—

The Examiner: That is received under the number mentioned.

(The document referred to was marked Commission's Exhibit No. 17-C and received in evidence.)

755 Mr. Binford: As Commission's Exhibit No. 18 I offer in evidence the U5A and U5B statements of the respondent, the Washington and Rockville Railway Company, a registered holding company and a sub-holding company in the North American System which bears file No. 30-163-1 of this Commission.

The Examiner: Let that come in as Exhibit 18.

(The document referred to was marked Commission's Exhibit No. 18 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 18-A I offer
756 in evidence the U5S or supplemental registration statement of the same company for the year 1937.

The Examiner: That is received under the number mentioned.

(The document referred to was marked Commission's Exhibit No. 18-A and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 18-B I offer in evidence a similar statement by the same company for the year 1938.

The Examiner: That is received as Exhibit 18-B.

—38—

(The document referred to was marked Commission's Exhibit No. 18-B and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 18-C I offer in evidence a similar statement by the same company for the year 1939.

The Examiner: All right, it is received as Commission's Exhibit 18-C. 758

(The document referred to was marked Commission's Exhibit No. 18-C and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 19 I offer in evidence the U5A and U5B registration statements of the respondent Northern Natural Gas Company, a registered holding company which is a sub-holding company within the North American System which bears File No. 30-169-1 of this Commission.

The Examiner: All right, that is received as Commission's Exhibit 19. 759

(The document referred to was marked Commission's Exhibit No. 19 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 19-A I offer in evidence the U5S or annual supplemental registration statement of the same company for the year 1937.

The Examiner: All right, it is received as Exhibit 19-A.

—39—

760 *Colloquy*

(The document referred to was marked Commission's Exhibit No. 19-A and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 19-B I offer in evidence a similar statement by the same company for the year 1938.

The Examiner: That is received as Exhibit 19-B.

(The document referred to was marked Commission's Exhibit No. 19-B and received in evidence.)

761

Mr. Binford: As Commission's Exhibit No. 19-C I offer in evidence a similar statement by the same company for the calendar year 1939.

The Examiner: That is received as Exhibit 19-C.

(The document referred to was marked Commission's Exhibit No. 19-C and received in evidence.)

Mr. Binford: The U5A, U5B and U5S statements or registration statements which have been offered in evidence bring the description of the companies of the North Amer-
762 ican System through December 31, 1939. A few changes in respect to the financial structure of these companies has been effected or proposed since that date according to documents filed by certain of the companies since that time.

Filings reflecting these changes and proposed changes have been made by the companies affected with this Commission.

—40—

I wish now to offer in evidence the dockets of the Commission in these particular proceedings which reflect things accomplished or proposed since the end of last year.

I therefore offer in evidence as Commission's Exhibit No. 20, Commission Docket No. 70-48 relative to the transaction participated in by the North American and by the St. Louis County Gas Company in which the common stock of the latter company was issued,

Mr. Hamilton: Mr. Examiner, the exhibit which counsel is offering now is somewhat of a different nature than others which have been heretofore offered, but in order to be clear on the record may we understand the same objections and same reservations apply in the case of these particular ex- 764
hibits which are now being offered as in the case of the exhibits previously offered?

Mr. Binford: That is agreeable to me.

The Examiner: Very well, that is the understanding.

Mr. Binford: That was reserved on the record.

The Examiner: You have finished describing it?

Mr. Binford: Yes, I have finished describing it.

The Examiner: Very well, the document which you have described is received in evidence as Commission's Exhibit No. 20.

765

(The document referred to was marked Commission's Exhibit No. 20 and received in evidence.)

Mr. Binford: As Commission's Exhibit 21 I offer in evidence Commission Docket No. 70-69 pertaining to the Washington Railway and Electric Company and Capital Transit Company and certain transactions related to the guarantee and assumption of bonds presently pending for which Washington Railway and Electric Company in the proceeding

766 *Colloquy*

reflected by the Docket is seeking the approval of the Commission.

The Examiner: The material in this docket is received as Commission's Exhibit 21.

(The document referred to was marked Commission's Exhibit No. 21 and received in evidence.)

Mr. Binford: As Commission's Exhibit 22 I offer in evi-
767 dence the Commission's Docket No. 70-9 pertaining to the North American Company and particularly to the approval of certain recent transactions by it in connection with a refunding of preferred stock by Wisconsin Electric Power Company.

The Examiner: All right, that is received as Commission's Exhibit No. 22.

(The document referred to was marked as Commission's Exhibit No. 22 and received in evidence.)

Mr. Binford: As Commission's Exhibit No. 23 I offer in
768 evidence Commission's Docket No. 70-1 which reflects the

refunding preferred stock operation of Wisconsin Electric Power Company in so far as that company as the issuing company is concerned.

The Examiner: That material is received as Commission's Exhibit 23.

(The document referred to was marked Commission's Exhibit No. 23 and received in evidence.)

769

Mr. Binford: As Commission's Exhibit No. 24 I offer in evidence Commission's Docket No. 70-12 in the matter of the Kansas Power and Light Company which is concerned with the recent preferred stock refunding operation of that company.

The Examiner: Let that come in as Commission's Exhibit 24.

(The document referred to was marked Commission's Exhibit No. 24 and received in evidence.)

770

Mr. Binford: As Commission's Exhibit No. 25 I offer in evidence Commission's Docket 70-22 in the matter of North American Light and Power Company, which docket pertains to the surrender by that company of certain preferred stock of the Kansas Power and Light Company in return for cash.

The Examiner: That is received as Commission's Exhibit 25.

(The document referred to was marked Commission's Exhibit No. 25 and received in evidence.)

771

Mr. Binford: As Commission's Exhibit No. 26 I offer in evidence Commission's Docket 70-6 in the matter of Wisconsin Electric Power Company which pertains to some interest reductions on a note or notes of that company.

The Examiner: That is received under the number which you have mentioned.

(The document referred to was marked Commission's Exhibit No. 26 and received in evidence.)

772 *Colloquy*

Mr. Binford: As Commission's Exhibit 27 I offer in evidence Commission's Docket No. 4343-255 in the matter of North American Light and Power Company which pertains to a recent issue of common stock by that company to the North American Company and to others.

The Examiner: Very well, it is received as Commission's Exhibit 27.

(The document referred to was marked Commission's Exhibit No. 27 and received in evidence.)

773

Mr. Binford: This concludes the evidence which counsel for the Commission wishes to offer at this time.

Mr. Browning: Are all these offered now?

Mr. Binford: Yes.

Mr. Browning: We haven't a yardstick, but I would like

—44—

the record to show that the statistical exhibits which have just been offered by the Commission would occupy a shelf some 20 feet long, that they include hundreds, if not thousands of documents and it is understood, of course, that they

774 have already been admitted with the objection subject to the reservation and exception agreed upon.

The Examiner: Yes. I have reserved a ruling as to whether the Commission is bound by this material and I am awaiting briefs from both sides on that matter.

Mr. Browning: And you also made a fuller statement all of which still holds good?

The Examiner: Yes, and that applies to right now.

Mr. Binford: When this hearing was convened on June 7th, counsel for the Commission made no opening statement

775

as to what the Commission proposed to prove, nor has any such statement been made yet. I think it is possible in order that I make a very brief statement at this time as to the position of counsel for the commission in respect to the effect of the evidence thus far introduced and the issues in this proceeding.

Mr. Hamilton: Mr. Examiner, before counsel for the Commission makes a statement may I ask whether this is intended to be a statement of his personal views or a statement of the views of the Commission?

776

Mr. Binford: This is a statement of the views of the Public Utility Division and counsel for the Commission. I

could hardly say it was a judicial determination by the Commission. It is nothing of that type at all. It is merely a reflection of what I, as counsel for the Commission believe the effect of the evidence is which has been so far established by the facts put in.

Mr. Hamilton: But it is not intended as an expression of the Commission's view?

777

Mr. Binford: It is not intended as an expression of the Commission's view either tentative or final.

Mr. Hamilton: In that case I object to any statement of the personal views of counsel for the Commission, with all due respect to him, or expression of views of the Utility Division inasmuch as the statements are not represented as being the views of the Commission.

It seems highly improper and beyond the scope of the issues for any such statement to be made. If the gentleman wishes to make a statement of the Commission's view that

778 is another question. If he wants to testify and subject himself to cross examination, that still is another question.

I would like to point out it is fully conceivable in this proceeding that another counsel or other counsel may represent the Commission at various times during the course of the proceeding, and such other counsel may well have other views.

We therefore can be apprised at no time what the particular attitude of the particular representative of the Com-

779 —46—

mission is at any given stage.

The Examiner: Well, Mr. Binford, isn't what you intend to say argument rather than testmony?

Mr. Binford: It is certainly not testimony. It is argument if it is anything. It is merely an attempt to advise the Examiner and to advise counsel as to what issues I, as present active counsel in this case, believe are raised by what has been put in evidence.

The Examiner: Well, in view of the objection which has been made I——

780 Mr. Binford: (interposing) It is for the benefit of the Examiner and any one reading the record as well as for the benefit of opposing counsel. Of course it carries no weight.

The Examiner: In view of the objection which has been made I feel that I must sustain the objection on the ground that the statement which you are about to make is argumentative and does not embrace testimony which we alone are considering in this matter, as I understand it.

This order directs me to take testimony and not to hear argument. Now it strikes me in the brief you are to submit

you might go into those matters if you think it necessary in your brief.

Mr. Binford: The Examiner feels then it would be out of order for me to make any statement which I might feel would show the purposes more particularly for which this

—47—

evidence has been introduced?

The Examiner: I suggest that you write out what you wish to present and submit it to counsel and see if their objection still holds good, or you may state it orally on the 782
record and then if counsel still insists on his objection I will rule on it then.

Mr. Browning: I think that would be quite sensible if Mr. Binford will give us a written statement of what he proposes to put in. We would be very glad to reconsider the question and decide then whether we will continue to press our objection.

Mr. Binford: I am not prepared to follow that course at this time and I respectfully except to the ruling of the Examiner.

The Examiner: All right. 783

Is there any objection, Mr. Browning, to his stating orally and then letting your objection come in?

Mr. Browning: If the Examiner please, I don't want to make technical objections, but our feeling was that the statement offered with the limitations imposed upon it made it improper for counsel for the Commission despite our objection to make a full statement for the record, and then we argue the objection later.

The record still has all the material in it. Accordingly we would much prefer the suggestion which the Examiner

—48—

784 *Colloquy*

has made. Since Mr. Binford was preparing to make a statement for the record I am a little puzzled as to why the Examiner's suggestion isn't the most practical way to handle the matter.

The Examiner: Off the record.

(Discussion off the record.)

The Examiner: On the record. We have reached the hour of 12:30 and we will recess until 2 o'clock. At that time we
785 will take this matter up again.

(Whereupon, at 12:30 o'clock p. m., a recess was taken until 2 o'clock p. m. this day.)

—49—

786

Colloquy 787

AFTER RECESS

(The hearing was resumed at 2 o'clock p. m., pursuant to recess.)

The Examiner: The hearing will be resumed.

Have you gentlemen changed your position with regard to the matter that we were discussing when the luncheon recess took place?

Mr. Browning: Not at this time, Mr. Examiner. 788

The Examiner: Well, I feel that I should sustain the motion which Mr. Hamilton made and you may have your exception, Mr. Binford.

Mr. Binford: Very good, sir. The Commission has no further testimony to offer at this time.

Mr. Browning: The respondent, the North American Company, moves for an adjournment of this proceeding for not less than four weeks. We submit that such motion should be granted for the following reason:

Until the denial by the Commission on June 7, 1940 of the respondent's motion for adjournment and to hold this 789 proceeding in abeyance, the respondent had every reason to believe that its answer in this proceeding would be given fair and careful consideration by the Commission and that it would have a reasonable opportunity to carry out the program outlined in its answer unhampered by extended hearings.

—50—

The Commission's denial of such motion was the first clear and unmistakable evidence of the Commission's determination to force this proceeding to an immediate hearing.

790 *Colloquy*

As soon as respondent was apprised of the Commission's attitude it commenced the preparation of its case and has been actively engaged in such preparation ever since.

As any lawyer will appreciate, however, to prepare this case properly, considering the extent and complexity of the issues of law and fact involved will require months of intensive effort. Any lawyer knows that to prepare the case adequately will require several months even though we have a large staff working on the matter.

791 Accordingly, the respondent is not now ready to present evidence and will require substantial additional time. This proceeding is the most vital and important to which the respondent has ever been a party involving, as it does, respondent's entire business future.

This proceeding raises or produces the most complicated and difficult question imaginable, involving as it does broad constitutional questions as well as serious questions of statutory consideration.

These questions must be resolved against a broad, factual background. Adequate preparation for such a proceeding
792 obviously can not be pushed through in a few short weeks

or even months. Every dictate of fairness and common sense as well as settled legal principles requires that adequate time, having in mind the nature of the proceeding, be afforded to respondent for preparation.

While this motion is for an adjournment of at least four weeks, it should be commented that not even four weeks time will permit respondent to adequately prepare its entire case.

793

At best it will put respondent in position to offer certain evidence when the hearing reconvenes following which further adjournments will be necessary from time to time.

Respondent is doing and will continue to do everything in its power to expedite the preparation of its case, however, and will present as much of its case as possible at the reconvened hearing.

We are requesting an adjournment of at least four weeks at the present time. That is, we are putting the request in that form instead of a request for an adjournment of several months because of the expressed desire of the Commission's staff to expedite the hearing. 794

In other words, Mr. Examiner, I think it is perfectly clear that it will require months to prepare the case and that we could do a lot better job in the preparation if we had adequate time. The better prepared our case is, the better it would go in, the less time of the Examiner and the Commission would be required, and in order to do a really good

job we ought to have several months.

795

Now on the other hand, I must state in fairness that we can have part of our case ready in four weeks and as long as the Commission wants the thing moving along we are making the motion for four weeks adjournment. My idea is at the end of the four weeks period when the hearing reconvenes I will put in everything I can. Then when we reach the end of what we have we will have to have further adjournment to prepare ourselves for further hearings.

I should also like to base this motion on still another ground. The Commission has offered in evidence today some

796 *Colloquy*

20 feet of shelf space of material. It is obvious that we should have a fair opportunity to go over the material and particularly with a view to correlating that material to what we ourselves intend to present. We have a very large proceeding here, a proceeding involving large issues. This tremendous bulk of statistical material is submitted and offered in evidence. Even if we had our case completely prepared up to the present time and were ready to step in here with witnesses who would take the stand, and there would be weeks
797 of hearing we would still need a substantial period of time to correlate our case with the Commission's case.

In other words, on that ground, we should be granted a substantial length of time.

The Examiner: Have you anything else that you want

to add before Mr. Binford is heard?

Mr. Browning: We have prepared here a written memorandum, Mr. Examiner, because we understood it would be convenient to have it for your purposes in considering the matter and I would like to submit that memorandum to you.
798 I should say that the memorandum which was prepared this morning before the hearing opened does not contain any discussion of the last point which I made with regard to the statistical exhibits and accordingly I hope the Examiner will remember that point.

The Examiner: Very well. Have you anything to say about this application, Mr. Binford?

Mr. Binford: Yes, I have, Mr. Examiner. Counsel has spoken of the insufficient time available for the preparation of respondent's case. I would like to point out the time of

hearing has twice been deferred and the last order of the Commission set definitely for this date. I think I have no authority to ignore that history of the continuances in this case and of the fact that the last time continuance was granted the Commission definitely set the case for hearing as of this date. 799

Furthermore, the reasons or grounds for argument which were submitted to support this motion for a continuance did not set forth, so it seems to me, any actual facts showing the necessity for the granting of the continuance. 800

—54—

The Examiner: You are talking now about what was said on the last motion?

Mr. Binford: I am talking about what was said on the motion presently pending before yourself.

The Examiner: All right.

Mr. Binford: There is no statement as to what these exhaustive exhibits or treatments of subjects by witnesses might consist of, as to what they go to, as to what issues are supposed to be supported by them, or anything except a general statement there would be a great mass of evidence which had to be assembled and put in here. We did have the respondent's somewhat exhaustive statement in a 20 foot shelf as counsel expressed it, as to their properties and systems. What additional requires the great preparation hasn't been shown or what great mass of additional material requires a further delay to be prepared hasn't been shown. 801

In other words, it is a mere statement there is to be a great mass of testimony in evidence. Possibly there is no

802 *Colloquy*

reason for it. There should be some showing what the evidence is that is required to be put in this case.

This Act has been enacted since 1935 directing the Commission to take this action as soon as possible after January 1, 1938.

The Examiner: What do I understand your position to be?

—55—

803 Mr. Binford: I oppose this motion for continuance at this time. I have no great argument against a short recess.

The Examiner: Do you want it to proceed right along continuously?

Mr. Binford: I see no necessity for four weeks or for any extended recess at this time upon any of the grounds asserted on the record by counsel.

The Examiner: We will have a short recess.

Mr. Browning: Could I make one suggestion, Mr. Examiner, which I hope you will bear in mind that on the scope of this case, if the Commission's own exhibits require 20
804 feet of shelf space, to do justice to the case, as they see it, I think it would be obvious to any experienced lawyer why the evidence for the respondent would require considerable time.

Mr. Binford: I would like to also add one further remark if I may.

The Examiner: All right.

Mr. Binford: Counsel has spoken of necessity for study by counsel for the respondent of the documentary evidence introduced on behalf of the Commission.

805

I want to call attention to the fact all this documentary evidence is material prepared by the respondents themselves with which they are undoubtedly as familiar as are the staff of the Commission.

—56—

Mr. Browning: I need hardly say that the respondent is familiar with which it has filed. I did not mean to suggest that the time was necessary for the respondent to become familiar with the material filed. If it were not familiar with that material it would not require six months. It would 806
require two years.

What I said was to properly correlate the material offered would require a substantial length of time.

Mr. Examiner, I have never seen a major case which was before a court to proceed, or anything like this nature where after one side had rested after putting an exhaustive record either in the form of statistics or of testimony the other side was not granted a period of time to correlate the material.

The Examiner: We will now go off the record.

(Discussion off the record.)

807

The Examiner: On the record. I think there is considerable merit in the application which has been made and I also think that it would be unfortunate and undesirable to start the next session at the end of the week on a Friday, so I am going to grant you additional time and will continue the case until 10 o'clock a. m., Monday, July 15, 1940. At that time I am going to rely on us being ready to proceed and make some progress with this hearing.

Mr. Browning: Yes.

808 *Colloquy*

Mr. Binford: I respectfully except to the granting of the —57—
motion for continuance.

The Examiner: All right.

(Whereupon, at 2:30 o'clock p. m., Friday, June 21, 1940, the hearing in the above-entitled matter was continued until Monday, July 15, 1940, at 10 o'clock a. m.)

—58—

809

810

BEFORE THE

811

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY AND
ITS SUBSIDIARY COMPANIES.

812

Room 1102,
Securities and Exchange Commission Building,
Washington, D. C.,
Monday, June 24, 1940.

The above-entitled matter came on for oral argument before the Commission at 10:00 o'clock a. m.

Present:

813

COMMISSIONERS JEROME N. FRANK (Chairman), ROBERT E. HEALY, EDWARD C. EICHER, and SUMNER T. PIKE.

Appearances:

RALPH C. BINFORD, Esquire, appearing for Securities and Exchange Commission.

S. PEARCE BROWNING, JR., Esquire, (Of Sullivan and Cromwell), 48 Wall Street, New York City, New York, appearing for The North American Company.

814 *Colloquy*

PROCEEDINGS

Chairman Frank: You may proceed, Mr. Binford.

Argument of Ralph C. Binford on Behalf of Securities and Exchange Commission.

Mr. Binford: May it please the Commission, this matter comes before the Commission upon an exception taken by me
815 on behalf of the Commission to a ruling of the Trial Examiner in the North American integration case.

This case came on for hearing at 10 o'clock a. m., on Friday, June 21st, pursuant to order of the Commission definitely setting the hearing for that date. That order had granted a continuance from June 7th to the 21st, in response to a motion for an indefinite continuance which was denied.

Last Friday counsel for the Commission introduced in evidence voluminous documentary matter consisting of the notice of registration as a holding company filed by each of the registered holding companies of the North American
816 system, the registration or U5B statements, the annual supplementary statements, or U5S statements filed by such companies, and certain filings covering the intervening period for each fiscal year.

Counsel for the Commission then stated that he had no further testimony to offer at that time, or that he wished to offer at that time.

Thereupon, he also endeavored to make a statement as to what he considered was the evidentiary effect in relation to the issues in the case of the material received in evidence.

Objection was made to that on behalf of the respondents upon the ground that it would be argumentative and should not properly go into the record.

That was in the nature of an introductory statement appearing in the case. That objection was sustained by the Trial Examiner and an exception was noted. That exception is now before the Commission.

Then, counsel for respondents presented an oral motion for an adjournment of this proceeding for not less than four weeks. Only general argument was offered in support of 818
that motion. I have the record here. It consists of three or four pages. The gist of it is—and I will try to state it as fairly as I can—that counsel for the respondent and respondent had reason to believe, until the entry of this Commission's order on June 7th, that in view of the program set down in the answer of the North American Company as to what it proposed to do to conform, according to its views, with section 11(b)-1, it had every reason to believe that there would be no extended hearings in the matter and that it could go ahead with that plan. No particular statement
was made as to what the reason was that made them believe 819
that.

Counsel then stated that only then did the North American Company start the preparation of its case.

Chairman Frank: Only when?

—61—

Mr. Binford: On or about June 7th, after the denial of the motion.

Commissioner Healy: Have you the entire Reporter's transcript of the proceedings?

820 *Colloquy*

Mr. Binford: I have, sir.

Commissioner Healy: Does that cover everything, and your offer of evidence?

Mr. Binford: It covers everything.

Commissioner Healy: May I see it?

Mr. Binford: Yes, sir. Here it is.

Chairman Frank: Did counsel for North American Company indicate that he or his client had been given assurances by anyone or that he had any grounds for believing that its
821 answer would be taken——

Mr. Binford: There is no statement in the record as to any reason for that expression of belief.

Counsel then stated that it would take a great deal of time to prepare the case, that is, a great deal of additional time.

Chairman Frank: When was the answer filed?

Mr. Binford: The answer was filed on May 16th. The proceedings were started on March 8th. There had been two postponements, the first one postponing the time for answering. In view of the matter in which the order was framed it
822. also postponed the time for hearing. That was 30 days,

—62—

which was the full amount asked for by North American at that time.

Subsequently, on this motion for indefinite postponement until the Commission had made a report under section 30 of the Act, which motion the Commission denied, it granted a further recess for two weeks.

Counsel has not stated what the evidence is that he says will take so much time to prepare on behalf of his company. There is an affirmative program laid down in the answer.

823

There is no showing that there is a necessity for any such voluminous testimony; there is no suggestion that counsel was taken by surprise when the U5B and U5S statements were put into the record. And there being nothing else offered by the Commission at that time, all of the evidence now in the record consists of material with which the respondent companies and the firm representing the respondents, I should say, should be very familiar, they having prepared this material themselves. As I say, there is nothing in the record which came in any way as a surprise.

824

Of course, rule 7 of the Commission's Rules of Practice provide:

> "A hearing before a trial examiner shall begin at the time and place ordered by the Commission, but thereafter may be successively adjourned to such time and place as may be ordered by the Commission or by the Trial Examiner."

—63—

825

It is recognized as a general rule that motions for continuances are addressed to the discretion of the Trial Judge or other officer presiding at a judicial or quasi-judicial hearing. However, the discretion so vested in the Examiner is, of course, a judicial and not an arbitrary one.

But here we have no evidence or specific statement of any character. It is merely the lack of preparation, without anything in the record.

The statute has been on the books since 1935, and certainly it has been plenty of notice as to the pendency of such a proceeding.

826 *Colloquy*

The general rule in respect of continuances for want of preparation is set forth in 17 Corpus Juris Secundum on page 203, as follows:

> "As a general rule a continuance for want of preparation will be refused. An applicant to be entitled to relief on such ground must show some precise legal or strong equitable reason and the exercise of reasonable diligence in every direction in which he claims
827 to be unprepared."

Counsel has not stated in what direction he is unprepared. He states it would take a lot of time to prepare the case. What the evidence is that he seeks to get has not been explained on the record.

Although there is discretion vested in the Trial Exam-

iner, yet the action of the Trial Examiner, upon the showing made upon the record, in granting a continuance of more
828 than three weeks in this proceeding, is without proper basis, is arbitrary, and should be reversed.

There might be some justification for a recess of a few days, or possibly a week; but why three weeks or a month is necessary certainly has not been shown on this record. If they have not prepared their case for this time there is no showing that they will be any better prepared six months or two years from now.

I respectfully submit that the ruling of the Trial Examiner should be overruled and the exception sustained.

829

ARGUMENT OF S. PEARCE BROWNING, JR., ON BEHALF OF RESPONDENTS

Mr. Browning: If the Commission please, Commission's counsel has given the situation which occurred on Friday. Our motion for an adjournment for at least four weeks was made after the introduction of the Commission's statistical and documentary case. Then I received notice of this appeal after reaching home late Friday night.

I might say at the outset that it would seem in a matter 830
of this nature the mere granting of a short adjournment in the course of the hearing by the Trial Examiner in the exercise of discretion should not be reversed.

Chairman Frank: Do you think we have no power to

—65—

reverse him?

Mr. Browning: Certainly, Mr. Chairman, every power to reverse him. My point is simply that some weight should be given to the Examiner's exercise of discretion.

Our motion to the Examiner was for a four-weeks adjournment, and for reasons which we stated fully. He gave 831
us a three-weeks adjournment; but I did not take an exception or plan an appeal from that order because I knew that the Examiner was obviously trying to be fair, and I would have preferred to accept that handicap rather than take the matter up on appeal.

To state our reasons for adjournment, we repeat that until June 6th and 7th the respondent believed that in view of the nature of its answer and the program which it had proposed that it would be given a reasonable opportunity to work out the program without there being extended hearings.

832 *Colloquy*

In other words, it really visualized an entirely different type of situation.

We all know, of course, that whereas under certain sections of the Act the procedure has now been worked out over an extensive period and matters go through rapidly and very easily, that these proceedings under section 11(b)-1 are new and that there was a real question as to what procedure would be followed.

In any case, this respondent understood that another

833 —66—

procedure was going to be followed.

The Chairman's question of a moment ago as to what specific statements we are relying upon is the next matter. Frankly, I would very much prefer not to go into that, simply for the reason that I think it would lead to useless recriminations. We feel that this respondent has been on very good terms with the Commission and its staff. We do not want to get into that kind of an argument. We think it would be very bad business for the future. But I can say to you without qualification that Mr. Shea, president of the

834 respondent, was under that very strong impression that there would not be extended hearings at the outset.

Accordingly, what the respondent did and what its counsel did was to rivet their attention on the answer and on the programs, and not on extended hearings; in other words, the actual preparation for the case.

When Mr. Shea came back from Washington after a conference on June 6th, and we also had the very definite action of the Commission on June 7th, we knew that we were wrong as to the Commission's views as to the general procedure to be followed; we knew that there were going to be

hearings, and extended hearings, and we started immediatly to prepare our case.

From time to time mention is made of 1935 and March 9, 1940. I submit that every lawyer in this room knows how many times he ever started to prepare a case for trial before his answer was submitted. I just wonder how many times

—67—

he did.

Now, as to the nature of the hearings, the comment is made that our remarks were general. This proceeding is 836
obviously the most important and vital to which the respondent has ever been a party or to which it can be a party under the Act. The members of the Commission know that just as well as I do. It raises the broadest, most complicated and difficult questions imaginable, involving both broad constitutional questions and questions of statutory construction. It is new. There are no precedents under section 11(b)-1. The question has been reserved by the courts.

This respondent, as its answer shows, had hoped to work out the matter with the Commission so that we would not be litigating constitutional questions. We did not want to. 837

On the other hand, I think it is clearly obvious that if we are going to have hearings and if we are going to have a full record, that this respondent must have a record which will bring out those constitutional questions; and those questions must be resolved, as we see it, against broad factual backgrounds.

Adequate preparation for such a proceeding obviously cannot be pushed through in a few short weeks. And I will go further and say that we could not do a really good job in less than several months. I think that any lawyer will

838 *Colloquy*

realize that if he puts himself in our position. Every dictate
—68—
of fairness and common sense, as well as settled legal principles, requires that the respondents be given adequate time to prepare for the hearings.

Chairman Frank: Did North American Company ask for a clarification of the issues along the line of U. G. I.'s answer?

Mr. Browning: No, Mr. Chairman. And since you raise
839 that point may I say just a word about it. It is somewhat ironical in this whole integration setup, the way things work out. As I see it, the Commission started in the integration proceedings on one theory. That theory, of course, was reflected in the form of notice and order, which was substantially the same for all companies. One of the systems then raised this point under section 11(a), and following that I believe four of the systems raised it; and tentative plans are being prepared for them. The ironical part of it is that those other systems have been given an adequate time for preparation. In other words, we are the respondent who
840 followed the line of thought which the Commission itself followed; we adopted the Commission's procedure and did not move for a bill of particulars.

Chairman Frank: Assuming that you had a right to get a bill of particulars or that the Commission considered it appropriate to give it as a matter of course; is the fact that you did not ask for one, and, therefore, I would gather
—69—
that you were entitled to one, the reason you must base your present motion upon the absence of such clarification as might conceivably have been given to you.

841

Mr. Browning: I am not basing it upon the absence of the bill of particulars. But I would like to say further that what we followed was the original viewpoint set forth in the order of the Commission; that is, that the evidence in the proceeding go in before anybody made up his mind as to what was what. And I simply point out that this is a highly ironical result, a remarkable result, that we are penalized for following that procedure.

Under these circumstances, what we really need is an adjournment for several months to prepare our entire case 842
adequately. When we so stated to the staff and they objected and wanted to go ahead, stating that they wanted to press the matter, we tried to meet their viewpoint just as far as we could. In other words, instead of making a motion for an adjournment for three months on Friday I made a motion for an adjournment of four weeks, and I stated that I did it with the idea that we could certainly have a fair amount of evidence ready for presentation at the end of the four weeks. We would not have our entire case prepared but we would be ready to go forward and put in material.

Chairman Frank: If the adjournment were granted and 843
you put in some evidence at that time, then you would ask for a further adjournment?

—70—

Mr. Browning: Yes, Mr. Chairman. I intend to do my very best with this adjournment. I intend to prepare just as much as I can on a hammer and tongs basis, and I intend to offer just as much evidence as I can offer at the end of the adjourned period.

This motion is a very different motion from the motion of June 7th. That motion went to the whole question of

844 *Colloquy*

what kind of a proceeding it is and what kind of procedure you are going to follow. This is a motion which one might characterize as being a motion in trial. It is simply for preparation. And we have stated unequivocably to the Examiner that we are going to go ahead with everything that we can get ready.

I have been asked how much can we get ready. I cannot say definitely. The more time we have, of course, the more we can get ready. I am dealing with people and with
845 witnesses I have never even met. I have to meet them for the first time. But we are going to do our best to meet the views of the Commission. We are sorry that they are the views of the staff. We would prefer to try the case the other way; but we are going to do our best to go along.

I would like to make an additional point. As Mr. Binford stated, the Commission had rested after offering these rather voluminous statistical documentary exhibits, which would require some 20 feet of shelf space. Of course, we are

—71—

846 familiar with that material. We certainly are. It is not a question of not being familiar with it. If it were new to us it would take years. What we want to do is correlate our case with the material that is in evidence so as to avoid duplication so far as possible and to make as good a record as possible. However, it is something that has a very material bearing on the adjournment, the fact that the Commission had introduced this evidence and rested.

I submit that on those reasons I have given that any court in the country would have granted us the adjournment which the Examiner granted.

847

I also submit that the Commission should not want us to go forward unprepared in these proceedings, first, because it is unfair. And fairness should be our first consideration at all times. Even if the company were wrong in its understanding, completely wrong, even if it had no justification for its understanding, still the fact is that it was its understanding, and we do need the time for preparation. And in that case it is unfair not to grant it.

Chairman Frank: In the light of the requests which have been referred to by counsel for the Division, do you think it would be appropriate, at the minimum, that the company file an affidavit stating that that was its reasonable understanding?

848

—72—

Mr. Browning: We will be glad to file that affidavit, Mr. Chairman, if you want us to do so. I stated the reasons why I thought it was desirable to avoid it. We want to keep on in the way that this respondent has dealt with this Commission in the past, able to discuss things with you at all times. If we have misunderstandings every now and then I do not think it helps things any to have an attitude of controversy about it. I am entirely willing to submit such an affidavit if you think it would be advisable.

849

Chairman Frank: We will consider it.

Mr. Browning: In the second place, these integration proceedings are new and difficult and a very large task for the Commission. You have a monumental task in them. One of the things on which we could help in that monumental task is to have a decent record come up from the integration proceedings. The Commission counsel can try its best, but it

850 *Colloquy*

takes both counsel to make a good record. We want to make a good record. We want to work right along with the Commission's counsel and have the best record that we can have so that you will have it before you. But that is one of the things that takes time.

If I may recall a famous letter of Cicero, you will remember he wrote in the letter "If I had had more time this letter would be shorter".

In other words, by asking for more time for preparation
851 I do not mean that the record is going to be any longer. I

—73—

think the record will be better, and it may be shorter.

Furthermore, we have had a very legalistic argument here. To take the practical aspect of the matter, we have told you our situation. What possible difference does it make to anybody as to this adjournment of three weeks.

The integration section has been involved a long time. These proceedings are going to take considerable time. We come in and we need three weeks more. I submit that it makes no difference to anyone else.

852 Up to now I have been trying to stress the practical considerations as we see them. We feel, and we feel very deeply, that to deny us time for adequate preparation would amount to a denial of due process and would make a farce of the hearing. I do not have any memorandum prepared for submission to the Commission today because there was insufficient time for it; but I can submit such a memorandum, if required.

Now, if I may say a word as to the length of the adjournment, the mere question of how long, the Commission's counsel himself has indicated that some adjournment would

853

have been proper. The period granted included three Saturdays, three Sundays and the Fourth of July. I expect to work on every one of those days. I am going to have to do it with just the three weeks adjournment. But we have general personnel, just as this Commission does, and I submit that to force all of your personnel to work every Saturday and Sunday and the Fourth of July is something that

—74—

should be done only when there is a controlling emergency that requires it. If the emergency comes they are all prepared to do it. And, of course, they will all do it if they have to.' I am not pleading for myself on this. As I say, I expect to work on all of those days anyway. But I think it has a definite bearing upon the question of the time granted.

854

The Commission's counsel has been very courteous in regard to the conduct of the proceedings, and this is the only disagreement which is brought before you. I very much dislike to see the proceedings start off with an elaborate argument on such a matter as this. We want to cooperate in conducting these hearings. We believe, however, that the Commission will understand and will be fair, and that the Examiner's ruling will be sustained.

855

The point was made in the argument of Commission counsel that I had not given any reasons for an adjournment. I think I have given quite a number of reasons. But if I have not been sufficiently specific, or if there is anything that I ought to add or that the Commission would like to have me add, I should be very glad to do so.

—75—

856 *Colloquy*

REPLY ARGUMENT OF RALPH C. BINFORD ON BEHALF OF THE SECURITIES AND EXCHANGE COMMISSION.

Mr. Binford: May it please the Commission, counsel for the respondents stated his desire to cooperate in every way to facilitate these proceedings and to expedite them. As I pointed out before, there has been no statement as to the nature of this evidence that they say will take so much time to prepare.

857 In their answer the respondents say they want to keep as their principal system a system based, as they expressed it, on St. Louis and operating in the contiguous states of Missouri, Illinois and Iowa. They mention numerous other properties which they state they are ready to dispose of.

There was an objection to my attempting to state what, under the circumstances, the evidence as received on the issues might possibly be narrowed down to.

Commissioner Healy: What issues do you think you have the burden of proof on? I have looked at the transcript, and you put in a great many exhibits. I don't know whether

858 they would occupy 24 feet of shelf space or not.

Mr. Browning: 20 feet.

Mr. Binford: I think that was an estimate.

Commissioner Healy: That may be a close estimate. But I do not discover any statement in the record as to what issues those documents are presented on.

—76—

Mr. Binford: I endeavored to state that but the Examiner sustained an objection to my statement.

Commissioner Healy: That is why I asked for the information at this time. On what items did you take the burden

859

of proof? Do you think that you have undertaken the burden raised by the A. B C. issues in the 11(b)-1, or do you think you have merely undertaken to prove how many integrated systems there are in the North American system?

Mr. Binford: The order issued in this case stated that it appeared to the Commission that the holding company system of the North American Company is not confined in its operations to those of a single integrated public utility system within the meaning of the Act, and such other businesses as are reasonably incidental, economically necessary or 860
appropriate to the operations of such integrated public utility system.

Commissioner Healy: The notice stated very plainly, or we tried to make it plain, that that was not an allegation. The fact that you prove there is more than one does not necessarily end it.

Mr. Binford: That is true. The U5B and U5S statements very definitely show that the North American system is not confined to a single integrated system. It tends to show what various properties and operations there are within the integrated system which might individually be so regarded. 861

—77—

Commissioner Healy: You are now getting to the point that I wanted to be informed about. Do I understand you to say that you introduced the evidence to show, (1) that there was more than one integrated system (2) to prove what they were?

Mr. Binford: I introduced it to show that there were more businesses and properties than could be regarded as one integrated system. It did not appear to be necessary, in view of the allegations, that we assume the burden of

862 *Colloquy*

proving in the first instance any more than that there was property which could not be regarded as within one integrated system.

That, if the Commission please, is the reason why I introduced it.

—78—

In the answer an apparent issue has been made by the North American Company that they will retain or will seek to retain the system based upon St. Louis, to which I re-
863 ferred. In view of that allegation in the answer, in the U5B and U5S statements and other material put in evidence it will very clearly appear that numerous other geographical groups of companies, such as those in Washington, or the District of Columbia, and adjacent territory, those around Cleveland, the Ohio group, and certain other properties could not under any interpretation of the Act be regarded as part of that St. Louis system. Therefore, they would have to be eliminated if the St. Louis system is retained as the primary system.

Commissioner Healy: Just confining yourself to the ques-
864 tion of what issues you undertook the burden with respect to, I think I understand you on the integration matter, but were you undertaking the burden on the A. B. C. standards of section 11(b)-1?

Mr. Binford: Not as to the retention of distant systems.

Commissioner Healy: Where do you conceive the burden of proof is on the issue as to whether t' North American Company can retain more than one integrated system.

Mr. Binford: I believe that burden of proof is on the company.

865

Commissioner Healy: And you did not mean by introduc-

—79—

ing the evidence you did that you were assuming the burden on that point?

Mr. Binford: No, sir; I did not. However, I propose to contend that the suggestion set forth in the answer, that Cleveland might be retained as an additional system, despite the intervening state of Indiana, was, on its face, as a matter of law under the A. B. C. standards, an impossibility. I think it could not be done because of the geographical dis- 866
tance between the two systems and because of the magnitude of the Cleveland system. As appears obvious from the U5B and U5S statements, it is such that it could stand on its own feet and could economically operate as an independent system. It is, in effect, so operated.

Possibly I was a little anticipatory if I stated that as one of the things which the exhibits were offered to prove. In the first place, what they were put in for was to show the magnitude of the property, the fact that they consist of more than one integrated system, and that numerous properties cannot be regarded as part of the properties based upon 867
St. Louis.

Commissioner Healy: Is there any real necessity for trying out the issue as to the Washington property since the answer, if I remember correctly, states that they propose to get rid of the Washington property.

Mr. Binford: It would seem not. But without permitting me to state those issues, counsel may be expecting to spend

—80—

months to prove that the Washington system is an integrated system, when probably it will not be a matter at issue at all.

868 *Colloquy*

Chairman Frank: You say you were denied the opportunity to make a statement?

Mr. Binford: The Trial Examiner sustained the objection to my making the statement at to the issues.

Commissioner Healy: On your Washington matter, it would seem to me that it might not be difficult to prove the Washington property and integrated system, and it might not be material. The question would be whether the holding——

869 Mr. Binford: They said St. Louis is what they want to keep.

Commissioner Healy: Having said they want to get rid of it, that issue might drop out of the case.

Mr. Binford: If counsel will state the reason he desires the adjournment is because certain necessary witnesses who are familiar with what may be regarded eventually as part of the St. Louis system have not been contacted yet, and what he proposes to prove by them, and what companies can properly be regarded as within it, then there might be some ground for an adjournment or a recess if for some good rea-
870 son he has not been able to prepare on that point. But he leaves it wide open as to what all of this evidence is going to be. I don't know, and I don't see how the Trial Examiner could know whether it will be material and relevant evidence.

—81—

Commissioner Healy: I do not understand the ruling under which you were not permitted to make a statement.

Mr. Binford: I excepted to it.

Commissioner Healy: You put in 12 feet or 20 feet of evidence in documentary form. So far as I can determine from

the transcript it was not stated what issues it was relevant to or what you intended to prove.

Mr. Binford: I attempted to make it.

Chairman Frank: Do you care to make a motion to overrule the Trial Examiner?

Mr. Binford: I excepted to the ruling.

Chairman Frank: Would you care to argue that now?

Mr. Browning: I would be glad to do so.

Chairman Frank: Why did you not want to know what your adversary's position was? 872

Mr. Browning: Because, Mr. Chairman, it was phrased, if I recall correctly, more or less as the personal views of trial counsel. It was not even a tentative official view with regard to the matter. In other words, if the particular trial counsel should be shifted to another hearing or another matter, a week later, as we see it, we could have an entirely different statement presented to us.

Had we understood it to have been a statement of the tentative position of the Commission, and official, we would

—82—

have had a different matter there. In other words, at that 873 point it would have been really like an opening statement of counsel.

Of course, I have some difficulty in seeing at what moment it gets to be a tentative statement of the Commission itself, and what the difference is between that and a bill of particulars.

Chairman Frank: Assuming for the moment that there is a difference, you are in a proceeding in which counsel for the Utilities Division is presenting evidence bearing upon the issues framed by the notice of hearing and your answer.

874 *Colloquy*

If he cares to tell you why he is introducing certain evidence I would think, if I were you, as his adversary that you would want to be enlightened because it would enable you in preparing your case to have a statement, and, as a result, it might be that you would not have to spend three weeks but would have to spend only a day. In other words, you have left yourself in such a mystified position as you are in here today, and, therefore, you want additional time because you do not know where he is headed. I think it would be illu-
875 minating to you and helpful in preparing your case to know why he introduced that evidence.

Mr. Browning: The suggestion was made at the hearing that since the statement was to be read in and there was nothing secret about it that we would have a chance to read

—83—

the statement and probably would withdraw our objection.

Commissioner Healy: Are you familiar with the stop order cases under the Securities Act?

Mr. Browning: No, sir.

Commissioner Healy: I would like to point out in that
876 connection that when counsel tries a case under section 8, the stop order, under the Securities Act, while acting as counsel for the Commission he is not stating the Commission's point of view.

Mr. Browning: If we had a statement presented which was going to be the position of the Commission counsel throughout the hearing, I think that is one thing. Perhaps I misunderstood the Commission's counsel; but it seemed to come in more as a personal statement of his views. I think the two things are different. We are getting into very fine lines there.

877

Commissioner Healy: They are too fine for me. I don't know how you can define a personal point of view and that of a man on the Commission's Utilities staff trying a case for the Commission. If you can find that line your eyesight is much better than mine.

Mr. Browning: We wanted to consider the matter and see if it would be possible—and I might say that I had some indications from Mr. Binford on the side as to what his views were.

—84—

878

We were directed to file a brief on that matter before the Examiner, but I do not have any brief ready. I have not seen the transcript.

Mr. Binford: File a brief on what?

Mr. Browning: File a brief on the question.

Mr. Binford: On that question?

Mr. Browning: Well, no; you are right, Mr. Binford. If the Commission wants to consider that question now I am perfectly willing to waive any notice of it and have it come up.

879

Commissioner Healy: What would you think of a program of this kind? Suppose the Commission were now to overrule the Trial Examiner's order or ruling sustaining your objection to Mr. Binford's making his statement and set the case for hearing Wednesday morning so that that statement could be made; then, after the statement is made take an adjournment until that afternoon or the next morning and then hear counsel on the subject of when the hearing should be resumed.

Mr. Browning: Mr. Commissioner, I want to be entirely cooperative and helpful; but that kind of a program is the

880 *Colloquy*

most time consuming from my own standpoint. I went back to New York Friday night ready to plunge into the preparation but I had to come down here this morning and argue it. That kills today. If I come down again Wednesday that will kill Wednesday.

—85—

Commissioner Healy: Are you prepared to make the statement this afternoon, Mr. Binford?

Mr. Browning: I think I can stipulate with Mr. Bin-
881 ford, if the Commission wants to rule from the bench that his statement is admissible. I will simply stipulate that the stenographer can take the statement—which would save a trip down here. Time is of the essence on this matter to us.

Chairman Frank: Then, suppose you do stipulate that he makes a statement and we consider that statement part of the transcript in considering your present matter or his present motion to overrule the Trial Examiner as to the adjournment.

Will that be satisfactory?

882 Mr. Browning: That will be satisfactory so far as procedure is concerned. Some of the discussion between the Commissioner and Commission counsel is getting into a much larger field, and that is the scope of the issues and what testimony will be relevant.

I learned that theory of Commission's counsel for the first time Thursday afternoon. He was very courteous. We discussed the theory at some length. We used time in between the hearing on Friday to discuss it, and I had gone back to New York Friday night to consider it, to see what its im-

883

plications are. Certainly it has a most important bearing on the hearings. There is no question about that.

—86—

(The statement by counsel for the Commission above referred to is as follows:)

Mr. Binford: I should like to make a short statement as to the position of Counsel for the Commission in respect to the effect of the evidence thus far introduced and the issues in this proceeding.

884

It would seem to be clear that, as alleged in paragraph 63 of the Notice and Order for this hearing:

> "The holding company system of The North American Company is not confined in its operations to those of a single integrated public utility system, within the meaning of the Act (the Public Utility Holding Company Act of 1935), and to such other businesses as are reasonably incidental, economically necessary or appropriate to the operations of such integrated public utility system."

885

It appears that the public utility holdings and operations of the North American system may be roughly divided geographically as follows:

(1) A group of public utility companies which may be said to be "based on St. Louis and conducting operations within the adjoining states of Missouri, Illinois and Iowa," including the operating electric utility companies of the Union Electric Company of Missouri holding company sys-

tem and including also The St. Louis County Gas Company;

—87—

(2) The electric utility properties and operations of The Cleveland Electric Illuminating Company, which are centered on Cleveland and located wholly within the State of Ohio;

(3) The electric utility properties embraced within the holding company system of Washington Railway and Elec-
887 tric Company, serving the District of Columbia and adjacent areas in Maryland and Virginia;

(4) The properties and operations of the system serving parts of Wisconsin and Michigan.

It further appears that none of these geographic groups of companies, or properties and operations, are geographically inter-connected with any properties or operations of any of the other groups, and no two of these groups could, under any construction of the Act, be considered as together constituting an integrated public utility system.

888 In addition to the three geographic groups mentioned, it appears that The North American Company controls the North American Light & Power Company system, which system is not an integrated public utility system.

Furthermore, it appears from the evidence already adduced that, in addition to its holdings in companies which are public utility companies or public utility holding companies, The North American Company, also has three direct non-utility subsidiaries, namely, 60 Broadway Building Corporation, North American Utilities Securities Corporation

—88—

and West Kentucky Coal Company. It has yet to be shown that the retention of the businesses represented by these companies is "reasonably incidental, or economically necessary or appropriate to the operations of (any) integrated public utility system" which The North American Company may retain.

The evidence already adduced also discloses the ownership and control by the companies of The North American system of interests in numerous gas utility properties which do not constitute integrated gas utility systems within the 890
meaning of the Act, and the ownership and control of interests in numerous non-utility businesses, the retention of which, likewise, has not yet been shown to be reasonably incidental, or economically necessary or appropriate to the operation of any integrated public utility system which The North American Company may retain.

In its answer, The North American Company has indicated a desire to retain as an integrated system certain properties "based on St. Louis and conducting operations within the adjoining states of Missouri, Illinois and Iowa, and one additional integrated system based on Cleveland." 891

It would therefore seem that an issue to be determined in this proceeding is the question of what particular properties can be considered as a part of an integrated system "based on St. Louis."

In respect of the desire expressed by The North American Company in its answer to retain "one additional integrated system based on Cleveland," a second issue will be the determination of whether or not such system may be retained as an "additional system" under Section 11(b)(1), with

particular reference to the tests laid down by paragraphs (a), (b) and (C) of that Section, and, in this connection I wish to state that it is the position of Counsel for the Commission that paragraph (B) of the (A), (B), (C) paragraphs requires that the whole of each additional system to be retained must be located in the state or states in which the principal system retained is located, or in a state or states contiguous thereto. Therefore, Counsel for the Commission takes the position that, as a matter of law, para-
893 graph (B) precludes the retention by The North American Company of its Cleveland system as an additional system, if a system based on St. Louis and conducting operations within the adjoining states of Missouri, Illinois and Iowa, is retained as the principal system. In the event that the position of Counsel for the Commission upon this point should not be sustained, and paragraph (B) should be so interpreted as not to require this result, an issue will be the determination of compliance of such proposed retention of the Cleveland system with the provisions of paragraph (A) and (C) of the Section.

894 Moreover, it may develop that the properties of the North

American system around St. Louis constitute more than one integrated public utility system and that if certain of these properties are to be retained by The North American Company, they will have to be retained, if retained at all, as "additional systems", and retention thereof will, therefore, have to satisfy the (A), (B), (C) standards. If such additional systems are found to be susceptible of retention under these standards, it will then, if the view of Counsel for the Commission is correct, be doubly obvious that the Cleve-

land system cannot under any construction of the Act be retained as a further additional system.

An additional question will be the determination of what interests in businesses other than that of a public utility company may be permitted to be retained as reasonably incidental or economically necessary or appropriate to the operations of the one or more integrated public utility systems which The North American Company may retain.

The North American Company, in its answer, states that its program does not contemplate "any present change of 896
the Company's investments in the Detroit Edison Company and Pacific Gas & Electric Company," which investments are minority investments. It is the position of Counsel for the Commission that, as a matter of law, the retention of these public utility investments by The North American Company, in addition to the retention of one or more integrated public utility systems, is precluded by the express

—91—

provisions of Section 11(b)(1).

Chairman Frank: Well, you may proceed, Mr. Browning.

Mr. Browning: Now, answering Mr. Binford's direct 897
question as to whether we would be prepared to put in testimony here, we are not prepared to put in testimony on the St. Louis Company. I can say without any reservation whatsoever that I am not in the slightest degree prepared for that. I can meet him four-square on that issue. I haven't even any idea who the witnesses are. I have not talked to them.

I think all of the lawyers in the room realize that when you are in that stage of the case that you need time.

I want to answer that question just as forthrightly as I can. I had hoped to consider the suggestion of Commission's counsel as to their views on the scope and then to get together with them sometime during those three weeks. Perhaps we can either agree on it or perhaps the matter can be raised in some preliminary way. However, it is an extremely important matter and it is a matter which should be very seriously considered by itself. I can argue it this morning if the Commission wants to; but I prefer not to.

899 Chairman Frank: Which question?

Mr. Browning: The scope of the issues. I am not prepared to argue it.

Chairman Frank: We will take the matter under advisement.

Mr. Browning: Now, do you want me to file an affidavit,

—92—

Mr. Chairman?

Chairman Frank: I do not think so. At least we will advise you if we think that will affect our judgment.

Mr. Browning: And I also have the question as to
900 whether it was desired that I file a memorandum of law.

Chairman Frank: There is no occasion to unless you want to do so.

Mr. Binford: Then, if the Commission please, I will avail myself this afternoon of the opportunity of dictating the statement which has been referred to in the record here. I will be glad to prepare that statement.

(Thereupon, at 11 o'clock a. m., the arguments were concluded and the Commission adjourned.)

—93—

BEFORE THE 901

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

902

Hearing Room 1103,
Securities and Exchange Commission Building,
Monday, July 15, 1940,
Washington, D. C.,

Met, pursuant to notice of the Commission, at 10:00 o'clock a. m.

Before: 903

W. W. SWIFT, Trial Examiner.

Appearances:

SULLIVAN & CROMWELL, by S. PEARCE BROWNING, JR., and CHARLES S. HAMILTON, JR., 48 Wall St., New York, N. Y., for Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

904 *Colloquy*

PROCEEDINGS

The Examiner: The hearing will be resumed. Are you ready, Mr. Browning?

Mr. Browning: Yes, sir. If the Examiner please, it will be recalled that at the last hearing which I believe took place on June 20, we moved for an adjournment for the preparation of our case and the Examiner then granted us an adjournment until today.

905 At that hearing, and when requesting an adjournment, I promised that I was going back to New York and work very hard, do the best we could, so that we would be in a position to put in as much evidence as possible.

I feel that in fairness to ourselves I must state for the record what happened subsequently. As soon as I returned to New York I received a telegram that an appeal had been taken from that decision of the Examiner and I was forced to come down to Washington again and argue the matter before the full Commission on the following Monday.

So far as I know, no decision has ever been handed down
906 on the appeal and the hearings are therefore reconvening pursuant to the original ruling by the Examiner.

I would like to point out in fairness to ourselves that not only was I brought back to Washington to argue about the adjournment, but that throughout the entire three weeks' period I have never known from day to day when the hearings were going to reconvene.

For example, one of the points which I mentioned on June 20 was the fact that it was important that I be able to leave for the Middle West. I have never been able to do

so because I didn't know from day to day when these hearings would reconvene.

I do want to say, however, that we have made a great deal of progress, we have got witnesses ready to put on the stand and that we are going forward and do our very best. We will go forward until we need more time to prepare the rest of our case.

Turning to another matter, the Examiner will recall the argument at the last hearing with regard to the Commission's exhibits, the question as to whether the Commission 908
could offer all of this material and not be bound by it, and that the Examiner directed that briefs be ready by the adjourned hearing——

Mr. Binford: (Interposing) I beg your pardon. I think the record doesn't show any determined time as to when those briefs were to be ready.

Mr. Browning: I will gladly accept that correction. My understanding was that they were to be ready. We have our brief ready, Mr. Examiner, and we are glad to file it.

(Discussion off the record.)

909

Mr. Browning: In accordance with your ruling, Mr. Examiner, we are filing ten copies of our brief in this matter.

—96—

The Examiner: All right, thank you. I will see that they are filed and taken care of.

Mr. Browning: We assume that counsel for the Commission will furnish us with their brief on this matter within a reasonable time.

Mr. Binford: Very easily, within ten days.

Mr. Browning: I might say in that connection I don't want to ask you to take less time than you want. I just wanted some estimate on your part.

The Examiner: Ten days is satisfactory, is it?

Mr. Binford: That is satisfactory to counsel for the Commission.

The Examiner: All right.

Mr. Browning: That is satisfactory to counsel.

The Examiner: All right.

911 Mr. Browning: The Examiner will recall that at the last hearing the Commission's staff offered in evidence the 20-foot bookshelf of documents and statistical material. Our review of those exhibits is far from completed.

It seemed to me that the first step was to get an index so I arranged to have people come down to Washington to get that index for me. The preliminary and quite incomplete index, because it doesn't give all the details, is 57 pages long, single-spaced.

The Examiner: That is the index?

--97--

912 Mr. Browning: Yes, Mr. Examiner, and that is quite incomplete. We have been endeavoring to get to this matter but have not been able to make any real progress with it so that we will have to devote considerably more study to those exhibits later.

What we have in mind is that it will be possible to simplify certain of the material and I am sure that Commission's counsel and ourselves will have no trouble agreeing on that, but to work it out properly will require several weeks' work on our part.

I should like to take up now another development, Mr. Examiner, since the close of the last hearing. It will be recalled that at the last hearing the Commission's staff proposed to place in the record a so-called statement of position on their part which was not a statement of position by the Commission but rather of particular counsel for the Commission, and that upon objection the Examiner ruled that such statement should not be admitted.

It so happened that this matter came up at the argument before the full Commission on the question of adjournment 914 and at that argument one or more of the Commissioners indicated that they felt that it might assist the hearings if such a statement went into the record.

Accordingly I stated that I had no objection whatever to taking the matter up and discussing it at that time and it was finally arranged that counsel for the Commission would read the statement into the record that afternoon by giving

—98—

it to the reporter. That has been done and the statement is now a part of the record.

Subsequently I received the following letter from the 915 Commission, with which letter I think the Examiner should be familiar:

"By direction of the Commission——"

Mr. Binford: (Interposing) Pardon me. May it please the Examiner, I object to reading by counsel of the letter into the record unless the letter, itself, is offered in evidence, unless I first have opportunity to examine it to know whether there is any objection to it.

(Letter passed to counsel.)

916 *Colloquy*

The Examiner: Let the record show that the letter, at least a copy of it, was presented to Mr. Binford for examination.

Mr. Binford: I have no objection to the offering of the written letter in evidence.

Mr. Browning: If the Examiner please, I do not see that this question of offering in evidence--the letter was a formal demand for a statement of position by the Respondent as to the issues in the case. There had already been——

917 Mr. Binford: (Interposing) I still object to——

Mr. Browning: (Interposing) Could I just finish?

The Examiner: Let me ask this question, is there any

-99-

dispute about the accuracy of this copy that you have examined? If there is I would like for it to be compared with the copy in the Commission's files and see what the situation is.

Mr. Binford: Subject to later verification as to this being a true copy of the original of this letter, and a right at that time to object to it as not, I have no objection to the copy

918 being offered in evidence.

Mr. Browning: As to correctness of the copy, I shall, of course, be delighted to have Mr. Binford verify that at his convenience.

Mr. Binford: I object at this time to the statement by counsel as to the legal effect of it or as to any other matter of its contents, other than mere identification of the letter. The letter, itself, would make the best evidence.

The Examiner: Is there any objection on your part to introducing the copy of this letter in evidence after you have completed your statement?

919

Mr. Browning: I have no objection to introducing it in evidence for the limited purpose of showing that such a letter was received by us as a statement by the Commission. If I may offer it for that limited purpose, I will be glad to do so.

The Examiner: Does that meet your objection, Mr. Binford?

Mr. Binford: I have no objection on that ground.

The Examiner: All right, you may proceed with your statement and later we will receive the letter with the reservation which you made.

920

—100—

Mr. Binford: May it please the Examiner, what I am objecting to principally at this time is a statement by counsel as to the contents of the letter. The letter, or a copy thereof, is available to be introduced in evidence.

Mr. Browning: I think I go along with Mr. Binford on that and that the letter will speak for itself in the record.

The Examiner: Well, of course, the letter will speak for itself, but I will let you read from the letter if you need to do so in connection with the statement you are making.

921

Mr. Browning: My suggestion is simply this, that since the position of counsel is now a part of the record, I would feel it was the best procedure to have this letter a part of the record and I offer this letter simply to show the step that was taken by the Commission, itself.

The Examiner: All right, the letter is admitted in evidence as Respondent's Exhibit 1.

Mr. Browning: The record shows, Mr. Examiner, does it not, that it is offered only for the limited purpose of showing the Commission's statement to us?

922 *Colloquy*

The Examiner: Yes. That is the reservation under which it is offered and received.

(The document referred to above was marked Respondent's Exhibit No. 1 and received in evidence.)

Mr. Browning: As the Examiner has noted from this letter, Respondent's Exhibit 1, the Respondents were called

—101—

upon or requested to furnish a statement to the Commis-
923 sion on or before July 5, 1940. In accordance with that request the Respondents did furnish a statement which is contained in a letter from Sullivan & Cromwell, addressed to the Commission, dated July 5, 1940, and I should like to read this letter, if I may.

Mr. Binford: I object on the ground that the letter, itself, is the best evidence. Further, counsel should have an opportunity to examine the letter and see if there are other grounds for objection.

(Document passed to Commission's counsel.)

924 Mr. Binford: Without conceding that the letter offered in evidence, to be more exact the carbon copy of the letter offered in evidence, having been addressed by counsel for the Respondent to the Commission, is in any respect a correct statement of the issues, and without conceding that the introduction of any evidence along the lines suggested by the letter is permissible, in view of the fact that The North American Company has heretofore filed an answer, as have the other Respondents, as a matter of law in connection with the notice and order filed by the Commission to determine

925

the issues in this case until one or the other is admitted, I have no objection to the letter going in evidence as the reply sent on behalf of the Respondents to the letter of the Commission which has heretofore been offered in evidence.

—102—

The Examiner: Is that the purpose for which you produce the carbon copy, Mr. Browning?

Mr. Browning: In the first place as regards the carbon copy, the original of the letter is in the Commission's files. I should be very glad to——.

926

The Examiner: As I understand, counsel has withdrawn his objection on the ground of the best evidence rule, have you not?

Mr. Browning: I understand he is reserving——

Mr. Binford: (Interposing) Insofar as this is a carbon copy, I am making no reservation.

The Examiner: All right.

Mr. Browning: If I understood counsel correctly, he wanted to reserve his right to compare this with the original in the Commission's files and make any correction from that original.

927

Mr. Binford: You have no objection to that?

Mr. Browning: I have no objection whatever to that.

As to the second point which counsel makes, there now appears in the record a statement by the Commission's counsel on this subject and I am offering this letter for the purpose of showing the statement which we have made on the same subject.

Mr. Binford: If it is offered for that sole purpose I have no objection.

928 *Colloquy*

The Examiner: Very well. With that exchange of your gentlemen in mind, the letter is received as Respondent's Exhibit No. 2, subject to the right to compare it with the original and correct it if any corrections are necessary.

—103—

(Document referred to was marked Respondent's Exhibit No. 2 and was received in evidence.)

Mr. Browning: Mr. Examiner, this letter deals with cer-
929 tain fundamentals of the case and accordingly I should like to read it.

"Securities and Exchange Commission,

Washington, D. C.

"Re: The North American Company and its Subsidiary Companies—File No. 59-10

"Dear Sirs:

"This is in reply to your letter of June 27, 1940.

930 I.

"In its order instituting the present proceedings, dated March 8, 1940, the Commission stated that the purpose of the hearing was to determine

"'(1) such issues, if any, as may arise from the allegations of Parts I to V hereof, inclusive, and the answer or answers filed thereto by the respondents herein or any of them as hereinabove provided, and by any other party or parties hereto as hereinafter provided; (2) what action, if any, is

necessary and shall be required to be taken by the respondents herein, or any of them, to limit the operations of the holding company systems of each of the registered holding companies hereinbefore named to a single integrated public-utility system, and to such other businesses as are rea-

—104—

sonably incidental, or economically necessary or appropriate to the operations of such integrated public-utility system; (3) pursuant to such application as may be made herein, the extent to which each of the registered holding companies hereinbefore named shall be permitted to continue to control one or more additional integrated public-utility systems as provided by Section 11(b)(1) of the Act; and (4) pursuant to such application as may be made herein, the extent to which any of the respondents will be permitted to retain any interest in any business (other than that of a public-utility company as such) as provided by Section 11(b)(1) of the Act'. 932 933

"The material issues arising from the allegations of Parts I to V of the order and notice of hearing dated March 8, 1940, and the respondents' answers thereto, arise from the allegations of paragraph 63 of the order and notice of hearing and paragraphs 2 and 7 of the answer of The North American Company (and corresponding sections of the answers of the other respondents).

"Paragraph 63 of the order and notice of hearing states that it appears to the Commission that

934 *Colloquy*

"'The holding company system of The North American Company is not confined in its operations to those of a single integrated public utility system within the meaning of the Act, and to such

other businesses as are reasonably incidental, economically necessary or appropriate to the operations of such integrated public utility system.'

935 "Paragraph 2 of the answer of The North American Company states:

"'2. In answer to paragraph 63 of said order, respondent alleges that the provisions of the Act are so vague and uncertain that the respondent does not have knowledge or information sufficient to form a belief as to what constitutes a single integrated public utility system within the meaning of the Act, or as to what constitutes such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such system within the meaning of the
936 Act.'

"Paragraph 7 of the answer of The North American Company states in part:

"'The respondent, on information and belief, alleges that Section 11 (b) (1) of the Public Utility Holding Company Act of 1935, and any other provisions of said Act which may be used to implement the purposes of said Section 11 (b) (1), if and to the extent that they purport to require action to

be taken by the respondent (including the divestment of control, securities or other assets) to dispose of its valuable investments or any substantial part thereof or to limit the operations of any of the registered holding companies named in said

—106—

order to a single integrated public utility system, and to such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public 938 utility system, are invalid, void and of no effect in that they violate and contravene the provisions of the Constitution of the United States and the Amendments thereto, * * *".

"Thus the issues, broadly stated, arising from the order and notice of hearing and the answers thereto, and Section 11(b)(1) of the Act, from which all of the Commission's authority to institute and maintain the proceedings must be derived, are:

"1. Whether the holding company system of The 939 North American Company is or is not confined in its operations to (a) those of a single integrated public utility system within the meaning of the Act, (b) such additional integrated public utility systems as meet the requirements of Section 11(b)(1) of the Act, and (c) such other businesses as are reasonably incidental, or economically necessary or appropriate to the operations of such integrated public utility system within the meaning of the Act.

940 "2. Whether, if the provisions of Section 11(b)(1) are to be or can be applied to the holding company system of The North American Company, and if the Commission shall so find, and that their application

—107—

requires The North American Company or any of its subsidiaries to divest itself of any valuable investment, any order of the Commission for such purpose under Section 11(b)(1) is constitutional.

941 II.

"Accordingly, the first issue, as we understand the proceeding, and therefore the first step in the administrative process, is a defining of The North American Company system's utility properties in terms of single integrated systems; with the further determination of whether any of such systems, if it be found there is more than one, meet the requirements for 'additional' systems.

"The statutory definition in Section 2(a)(29) furnishes the following characteristics of 'a single integrated public-utility system':

942 "(i) *Capability of physical interconnection.*—'physically interconnected or capable of physical interconnection',

"(ii) *Economy of operation,*—'under normal conditions may be economically operated as a single interconnected and coordinated system',

"(iii) *Single region,*—'confined in its operations to a single area or region, in one or more states', and

"(iv) *Size,*—'not so large as to impair (considering the state of the art and the area or region affected) the advantages of localized management,

—108—

efficient operation, and the effectiveness of regulation'.

"Manifestly, the application of these norms or characteristics of a 'single integrated public-utility system' to the operating subsidiaries and groups of subsidiaries of The North American Company, if they can 944
be applied at all at this time, requires the most careful and exhaustive investigation into the facts concerning the physical properties, nature and method of operation, area or region of service, type of management and effectiveness of state regulation for each company in the North American system.

"If the Commission should find that there are two or more single integrated systems it must next apply the (A), (B) and (C) standards of Section 11(b)(1) in order to determine whether any such systems may 945
be retained as 'additional integrated systems', and evidence as to the properties and activities of the respective companies would be requisite on this issue.

"The next issue arising in any attempt to apply Section 11(b)(1) to the North American system is a determination of what businesses are found in the holding company system, in addition to 'a single integrated public-utility system' and such 'additional integrated public-utility systems' as meet the requirements of Section 11(b)(1), and whether such other busi-

nesses 'are reasonably incidental, or economically necessary or appropriate' to the operations of the 'integrated public-utility system'.

—109—

"The North American Company owns a controlling interest in The North American Light & Power Company, and there is, therefore, involved in the case also the question of whether the operating properties of The North American Light & Power Company system,
947 or any of them, can be combined with any of the properties of The North American Company system. The definition of a single integrated public utility system in paragraph 2(a)(29) provides that electric properties may constitute a single integrated system *'whether owned by one or more electric utility companies'*. Accordingly, if any of the properties in The North American Light & Power Company system meet the statutory tests, alone or in combination with any of the properties or groups of properties of The North American Company system discussed above, such
948 properties of The North American Light & Power Company could be deemed a part of The North American Company integrated system or systems.

III.

"Should the Commission hold that Section 11(b)(1) requires the North American Company to dispose of any of its assets, there is raised by paragraph 7 of its answer the fundamental issue as to whether Section 11(b)(1) is constitutional. This necessarily involves the issue of whether the North American

949

Company and its subsidiaries are subject to the jurisdiction of the Federal Congress and the Commission, whether Section 11(b)(1) is not an unlawful delega-

—110—

gation of legislative power, whether without violating due process of law, Congress and the Commission may require The North American Company or any other respondent to dispose of any of its valuable assets lawfully acquired, and whether such action is not a usurpation of the powers reserved to the states under 950
the Tenth Amendment and otherwise in violation of the Constitution. The determination of such constitutional issues, both by the Commission and by the Courts upon any subsequent appeal, should be made upon a record giving all the necessary facts.

"Accordingly, on the constitutional issues alone the evidence should show all of the facts concerning the property, business and operations of The North American Company and each of the companies in its holding company system and the intercorporate relations between them, so that it can be determined 951
whether any of them is engaged in interstate commerce and, if so, the extent thereof, and whether their operations directly affect interstate commerce and are therefore subject to the jurisdiction of the Federal Congress or of the Commission, and whether the continued ownership by The North American Company of all of the assets now comprising its system burdens or harmfully affects interstate commerce, and whether, in the event the Commission should order The North American Company or any of its subsidiary com-

panies to divest themselves of any of their assets, such order is a proper and reasonable exercise of jurisdic-
—111—
tion, whether any abuses or problems exist among the companies in The North American Company system which would justify such a divestment order, the extent to which any such divestment would harm The North American Company and deprive it of property without due process of law, and whether any such
953 divestment is reasonably and appropriately designed to accomplish any legitimate Federal objective, and whether Section 11(b)(1) does not in any case constitute an unlawful delegation of legislative power.

IV.

"The foregoing, as we understand it, sets forth substantially the basic issues. In addition, it should also be noted that certain issues of fact arise from paragraph 1 of the answer of The North American Company. There will also arise, of course, from time
954 to time, incidental issues as to matters of interpretation and the like, to which we do not refer at this time.

"The program set forth in Part III of The North American Company's answer cannot be considered as limiting or narrowing the scope of the issues in this proceeding. That program is based entirely upon the hypothesis that the steps therein set forth would be voluntary, with the executives of The North American Company enabled to devote their full time to such matters and without fixed limitations of time in which the steps might be completed. The Company proposed

such voluntary program in good faith, and in the hope of a constructive disposition of this proceeding, and

—112—

still believes that such voluntary action would be preferable. However, the Commission, by denying respondent's motion to hold these proceedings in abeyance pending the consummation of such voluntary program, refused to permit respondent to proceed therewith and instead elected to litigate the issues. The Commission has no power to require The North 956
American Company to take any step except as provided in Section 11(b)(1), and any such order, under Section 11(c) must be complied with within one year, or at the maximum two years, of the date of the order. Such procedure, namely by order rather than voluntary, and with time limitations rather than when conditions permit, is wholly foreign to the procedure suggested by The North American Company when it stated in Part III of its answer certain steps which it proposed to take if, as and when they could be consummated. Accordingly, the program in Part III of 957
The North American Company's answer cannot be regarded as limiting the scope of the issues in the present hearing.

"It may be further noted that counsel for the Commission has taken the position that, as a matter of law, The North American Company's investments in The Detroit Edison Company and Pacific Gas & Electric Company may not be retained by it. As set forth in paragraph 6 of the Commission's notice and order, such Companies have filed applications for exemption

958 under Section 2(a)(8) of the Act and such applications are pending and undetermined. Accordingly,

—113—

neither of such Companies can be regarded as a subsidiary of The North American Company for any purpose at this time. Since Section 11(b)(1) refers to 'such action as the Commission shall find necessary to limit the operations of *the holding company system* * * *' and 'holding company system' is defined in Sec-

959 tion 2(a)(9) as including 'any holding company together with all *its subsidiary companies* * * *', it would seem clear that the investments in The Detroit Edison Company and Pacific Gas & Electric Company are not involved in the present proceeding, nor could they be dealt with appropriately until the primary question of their status has been determined. Accordingly, while we do not agree with the legal position of counsel for the Commission, it is the position of The North American Company that in any case the status of such investments is not at issue in the

960 present proceeding.

V.

"We believe that the foregoing statement, which is made on behalf of respondents, The North American Company and its subsidiaries, covers the four questions contained in your letter of June 27, 1940. However, such questions may be taken up in order, as follows: As to question 1, we do not consider that the issues have been correctly stated by counsel for the Commission in his statement submitted for the record on June 21, 1940, except in so far as certain

961

issues specified by him are included in the issues set forth in this reply. As regards questions 2, 3 and 4, respondents consider to be at issue the retention of

—114—

all the utility properties of The North American Company system and all of the businesses which the Commission finds to be in such system, whether as a single integrated system or as additional systems, and all questions which may arise under Section 11(b)(1), including the (A), (B) and (C) standards thereof."

962

963

964

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

965

Hearing Room 1102-A,
Securities and Exchange Commission Bldg.,
Monday, August 5, 1940,
Washington, D. C.

Met, pursuant to recess at 10:00 o'clock a.m.

Before: W. W. SWIFT, *Trial Examiner.*

966 Appearances:

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, N. Y., Attorneys for the Respondents.

S. PEARCE BROWNING, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, N. Y., Attorneys for the Respondents.

RALPH C. BINFORD, and E. M. CALKIN, Attorneys for the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Lindseth!

Whereupon, ELMER L. LINDSETH called as a witness on behalf of the Respondents, being first duly sworn, was examined and testified as follows:

Direct Examination by Mr. Hamilton:

968

Q. Will you give your name to the reporter? A. My name is Elmer L. Lindseth.

Q. And your address? A. Hudson, Ohio.

Q. You are connected with Cleveland Electric Illuminating Company? A. Yes, I am; I am technical assistant to the President of the Cleveland Electric Illuminating Company.

Q. Will you describe your various functions and services with the Cleveland Electric Illuminating Company since you first began your connection with the company? A. I began working for the Cleveland Electric Illuminating Company in 1925, temporarily employed, while still in college, on a 969 job testing power plant equipment.

At the completion of my work in college I returned to the company in a permanent capacity as a junior tester in the

Production Department, and in that job worked in the testing of power house equipment, the calculation of system efficiencies and economies, the design calculations of heat balance, and other engineering calculations of power plants, and similar duties—strictly a subordinate position.

970 *Elmer L. Lindseth—By Respondents—Direct*

In 1927 I was made production engineer for the company in which position I was in charge of the technical engineering for the operation of the power plants of the system.

The production engineer was responsible for the efficiency of operation of the system; the economical allocation of load between power plants; certain of the design phases, particularly those influenced by efficiency and economy; the maintenance of certain types of equipment; and in that capacity I had, at various times, a staff of from 20 to 30
971 engineers, assistants and the like.

In 1937, I became assistant to the executive engineer for the company. The executive engineer of the company is in charge of all phases of the company's engineering, mechanical engineering, electrical engineering, civil engineering, design, construction, research, joint wire relations with other utilities, and the statistical departments of the company.

I served as assistant to the executive engineer.

During this period I made a comprehensive investigation of the company's sales and advertising policies, the accounting therefor, the results obtained, the methods pursued, the
972

measure of results—in short, all phases of the sales promotion and advertising business of the company.

During 1938 and 1939, in connection with an investigation of the company by a firm of engineers employed by the City of Cleveland, in connection with a report to be prepared for the basis of a rate ordinance, I was in charge of the company's parallel report on all phases of the operations of the company, its accounting, its fixed asset accounts, depreciation, business promotion, rates, service, all phases of the

company's business as would be necessary to form the basis for an adequate ordinance to regulate the rates of the company.

Shortly thereafter, in 1939, and the early part of 1940, I was in charge of a staff of engineers which at times reached more than 200, in connection with an inventory and appraisal of the property of the company devoted to the service of the City of Cleveland, and in that connection participated in the conferences with the Public Utility Commission of Ohio and the Council of the City of Cleveland, since this 974
inventory and appraisal was being performed in accordance with the requirements of the Public Utility Commission of Ohio and the City Council of the City of Cleveland.

This investigation, too, embraced all phases of the company's business, operating expense, fixed assets, depreciation policies, rate-making and similar phases.

I participated in the hearings and negotiations, the con-

ferences with the Public Utility Commission and with the City Council of the City of Cleveland, and this culminated in a rate ordinance which terminated the case. 975

During this period I became technical assistant to the president of the company, in which capacity I now serve, in an advisory capacity to the president in technical and operating matters.

Q. Your service with the company has been continuous since 1926? A. Yes, since August, I think, 1926—yes, August, 1926.

Q. Now previous to your service with the company, what had been your business experience? A. Well, I had worked

976 summers while going to college, for the New York Central Railroad Company and for the National Acme Company. In the former of those, I had been in electrical maintenance and construction work, in line gangs, and had served as a ground man in a line gang: and in the latter of them, the National Acme Company, I had been a machine operator.

Q. Will you state your education? A. I was educated in the public schools in Cleveland. I was graduated from Miami University in 1923 with an A.B. Degree; from Case
977 School of Applied Science in 1925, with a degree of Bachelor of Science; and from Yale University in 1926, with a degree of Master of Science.

Q. You are a registered professional engineer in Ohio?

A. Yes, I am a registered professional engineer in the State of Ohio, No. 2656.

Q. In order that we may identify the names of the companies as to which your testimony will be directed, would you give the names of the companies comprising the Cleve-
978 land group, and in a word or two state the business which they do? A. The companies in the Cleveland group are three in number, the Cleveland Electric Illuminating Company, which is engaged in the electric utility business, and incidental thereto, the steam heating business in the City of Cleveland.

There are two subsidiaries of the Cleveland Electric Illuminating Company—the Power & Light Building Co., which owns title to the office building in which the offices are located, and the Ceico Company, which is an incidental subsidiary devoted primarily to the servicing and maintenance

of meters on consumers' premises, but incidentally holds title to real estate which is temporarily acquired for construction and is to be disposed of.

Q. Both of the latter two companies you have referred to are direct subsidiaries of Cleveland Electric, is that right? A. Both are wholly-owned subsidiaries, and neither is a public utility.

Q. Now in order to get an overall picture of the area which the Cleveland Electric Illuminating Company serves, would you indicate briefly the territory served by its electric 980
service? A. Hereafter, in referring to The Company, I

will mean the Cleveland Electric Illuminating Company; and when any of the subsidiaries are referred to, I will refer to them by their complete name.

The Company serves a compact industrial and agricultural area in the Northeastern part of Ohio, centering around Cleveland, but including three other Lake cities, Conneaut, Ashtabula, and Fairport.

Mr. Hamilton: I ask that this document be marked 981
for identification as Respondents' Exhibit No. 21.

The Examiner: That may be done.

(The document referred to was marked Respondents' Exhibit No. 21, for identification.)

By Mr. Hamilton:

Q. Will you explain what Respondents' Exhibit 21 for identification portrays? A. This map shows the territory served by the Company, it being the area outlined by the heavy black line.

982 *Elmer L. Lindseth—By Respondents—Direct*

Q. Has the map been prepared under your supervision? A. Yes, it has.

Q. The facts shown are taken from the records of the Company, is that correct? A. Yes, the data are definitely from the records of the Company.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit 21.

—596—

Mr. Binford: No objection.

983 The Examiner: All right, it is received in evidence under the number assigned.

(Respondents' Exhibit No. 21 was received in evidence.)

By Mr. Hamilton:

Q. Please refer to the map wherever necessary in your testimony. A. The territory shown is along the South shore of Lake Erie in the Northeastern portion of Ohio, and the vertical line at the right of the map is the Pennsylvania-

984 Ohio border. The territory extends Westward from this Pennsylvania-Ohio line about 100 miles, to the point marked Avon, and it has an irregular Southern border, yielding an average depth for the territory of about 17 miles in an aggregate area of about 1,700 square miles.

Q. Now would you explain the significance of the double cross-hatched area which contains the legend "Cleveland and suburbs", on Exhibit 21? A. At the left center of the map, there is a double cross-hatched area labeled, "Cleveland and suburbs", and in parenthesis, "Cuyahoga County". The double cross-hatched area comprises the municipalities shown

in the list of cities and villages up in the legend, a substantial number, probably 50, which comprise Cleveland and immediate environs. In fact, that list includes all of the cities and villages in Cuyahoga County.

—597—

The portion double cross-hatched, not only in Cleveland but throughout the map, is territory in which the distribution facilities are so many in number as to make it impractical to portray the facilities in the one-line diagram and it is intended that double cross-hatched areas be regarded as 986 having facilities available to all portions of the city.

The single cross-hatched areas, that is, lines going in only one direction, are incorporated municipalities, but are not necessarily of such population density as to justify lines of such frequency that they can not be portrayed. So that there, the distribution facilities are shown, even though the area is an incorporated municipality.

Q. Now there appear on the map a number of letters, such as LD and HR. Would you mind explaining the significance of those letters? A. If you will refer to the left center of the map again, the portion which is Cleveland, those symbols 987 of two letters are the symbols for distribution sub-stations, or transmission sub-stations, or power plants, and are a part of the company's code of identifying properties and lines.

For example, the symbol "LS", near the large circle, labeled "Lake Shore", is the abbreviated symbol for Lake Shore power plant.

Similarly, just below, the symbol "SC" is the abbreviated symbol for St. Clair sub-station.

—598—

988 *Elmer L. Lindseth—By Respondents—Direct*

Throughout the map this code is embodied, and it conforms with the Company's records for identifying property.

Now Cleveland is the commercial and trading center of this area. The population of the entire area is about 1,400,000 people.

Q. That is, the entire area served by the Company? A. The entire area in which the Company serves.

Of this 1,400,000, about 1,215,000 is in Cuyahoga County alone, in which is located the city of Cleveland, the popula-
989 tion of which is 875,000.

Cleveland distributes to the territory, and the territory in turn produces some products marketed in the Cleveland markets.

Of the total area served by the Company, a little over 500 square miles is shown cross-hatched, and is incorporated territory. The uncross-hatched sections are about 1,156 square miles, and are, by our definition, rural, although it should be pointed out that certain of the territory which is cross-hatched and is an incorporated municipality, is in fact rural in the popular conception of what is rural.

990 Q. If we may go back for just a moment, are your population figures based on Census figures? A. The population figures are preliminary 1940 Census data.

Now this territory served comprises a little over 4 per cent., 4.2 per cent. of the area of the State of Ohio. The

population contained therein, 1,400,000 people, is about 20 per cent. of the population of the State of Ohio. The electricity sold in the area by the Company and others aggregates about 1,785,000,000 kilowatt hours as of 1939, which is

25 per cent. of the energy sold to ultimate consumers in the State of Ohio last year.

The figures then reveal, first, a high population density, because 20 per cent. of the people in the State reside in 4 per cent. of the area; but more than that, those 20 per cent. of the people used 25 per cent. of the electric energy sold to ultimate consumers in the State of Ohio last year.

Q. Is Cleveland the economic center of the territory shown as being served by the Company? A. Cleveland, as would be expected, is the economic center of this territory. 992
The roads converge on Cleveland, the railroads, the bus lines converge on Cleveland, and the territory in reality is a single wholesale area, and in substantial measure a single retail area.

A substantial portion of the people who actually work in downtown Cleveland live in these surrounding townships, and even in adjoining counties, and with modern means of transportation they travel to work by automobile, bus, railroad, rapid transit, and other means of public transportation.

Cleveland, in keeping with the trend in certain other 993
large cities, is decentralizing, that is, population is moving out of Cleveland to the suburbs; industry, in some measure,

is building new plants not inside Cleveland, but in the industrial suburbs and adjoining communities.

For example, the population of Cleveland in 1930 was 900,000 people, by official Census; by 1940, that population had declined to 875,000 people in municipal Cleveland, which is the compact inner municipality.

994 *Elmer L. Lindseth—By Respondents—Direct*

Cuyahoga County, however, has increased in population in the same period, as have Geauga County, which is a county immediately to the East, and Lake County, which is a county to the East along the Southern shore of Lake Erie. These have increased—in Lake County, from 41,000 to 48,000; and in Geauga County—from 15,000 to 17,000 population.

These main highways which serve the territory are, the most important of them, 11 in number, United States and
995 State routes, which do converge on the center of Cleveland.

The distances are not great. From the center of Cleveland, which is mathematically that circle described as "PS" in the center of the map, right under the symbol "Lake Shore" that symbol is "Public Square sub-station" of the Company, and is located on the Public Square of the City of Cleveland. The distance from there to the Western extremity is about 25 miles, and to the Avon plant, 23 miles, a distance that is ordinarily covered in something less than 40 minutes.

To the extreme Eastern limits of the territory, the Penn-

—601—

996 sylvania-Ohio line, is about 75 miles, and to Conneaut, the city in the upper right-hand corner of the diagram, the distance is 72 miles, and is normally covered in something less than 2 hours.

Q. Now if you will explain the meaning of these various names that appear on the exhibit, No. 21; for example, the name "Geneva" appearing in the right-hand upper section? A. Names in the type face shown by the word "Geneva", or immediately above, "Geneva-on-the-Lake", those names are the names of incorporated municipalities. Some are cities, some are villages.

Q. These names don't represent all the towns and villages in the entire territory, but rather, the larger towns and cities or villages, is that correct? A. No, I think rather that every incorporated municipality outside Cuyahoga County does have located near it on the map, its name. The large number of them in Cuyahoga County makes it impractical to put them on the map, and they are shown in the legend. I think every municipality served is indicated on the map by title.

The distance to some of these other outlying communities, Jefferson, for instance, which is just below Ashtabula, is 59 998 miles from the center of Cleveland; Rock Creek, just below it, is 53 miles; Chardon, in the right center of the map, which is the County Seat of Geauga County, is 30 miles from the

center of Cleveland, normally about 50 minutes of travel.

Because this territory is one rather densely populated and has adequate roads, there are likewise numerous railroad facilities, and the territory is served by 7 railroads: the New York Central; the Baltimore & Ohio; the Big Four; the Erie; the Nickel Plate; the Pennsylvania, and the Wheeling & Lake Erie. 999

Four of these use a single passenger terminal in the center of Cleveland on the Public Square, and two of them, the New York Central and the Big Four, are electrified, taking service from the Company from, roughly, the Eastern limits of Cleveland to and through Cleveland to the Western limits of Cleveland.

While there are numerous private airports in the territory, a single mainline commercial airport serves the entire territory, and that is the airport located in Cleveland, from which some 214,000 passengers cleared last year.

1000 *Elmer L. Lindseth—By Respondents—Direct*

Q. What are the population characteristics of the territory served? A. These 1,400,000 people to which I have referred, of which 1,200,000 live in Cleveland, are families of industrial, commercial and agricultural interests.

Last year a survey showed that there were about 325,000 families in Cuyahoga County. The 1930 Census showed that 28 per cent. of the family heads in Cuyahoga County were native Whites, of native parentage; 26 per cent. were White, of foreign or mixed parentage; 40 per cent. were foreign-

1001 —603—

born White; and 6 per cent. Negro.

Now as indicative of the character of the community, the residential use of electricity in 1939 for these consumers was 924 kilowatt hours per consumer. In the United States as a whole that year, the average use per residential consumer was 897. So that the average use per residential consumer in this territory is slightly higher than in the United States as a whole.

Q. By "this territory" you mean the entire service territory? A. The entire territory in which the Company serves.

1002 Q. Shown on the map? A. Yes. And this is the more significant, perhaps, when it is considered in the light of the availability of natural gas in this territory where the development of the electrical cooking load and the electrical water-heating load is definitely less than in many other communities where natural gas is not available at low cost.

Further, as evidence of the character of this community, the average family income in 1929 was slightly over $2,000. By 1932 this had dropped to $1,400; and in 1933, it had further dropped to $1,243.

In Cuyahoga County, the number of residential telephone subscribers was about 155,000 last year. That is, the number

—604—

of telephone subscribers was less than one-half of the number of families in the community.

The number of direct relief cases this year, May 1940, was 33,900, or the ratio between the number of relief cases and the number of families was about one in ten.

The number of certified persons in Cuyahoga County employed by the W. P. A. in June of this year was slightly 1004
over 26,000, or a number which bears a ratio of 8 per cent. to the total number of families.

The estimated number of jobless people in Cuyahoga County on June 1, was 117,900.

Q. That includes persons on direct relief, does it? A. That does include the persons on direct relief. That is a number which equals roughly 10 per cent. of the population of Cuyahoga County.

Now in addition to Cuyahoga County, to which I have given considerable attention, the Company's territory em-
braces parts of four other counties. On the extreme West, 1005
a portion of Lorain County; immediately to the East and the Southerly part, Geauga County; to the East of the central part of the map, Lake County; and to the extreme right, Ashtabula County.

The territory includes 133 political sub-divisions, 15 cities, 67 villages and 51 townships.

Q. In order that we can get some idea of the relative size of the communities outside of Cleveland proper, would you indicate the cities or incorporated villages having a

—605—

important industrial enterprises; Garfield Heights, a city of 17,000, a middle-class residential suburb; Lakewood, along the shore of the Lake to the West of Cleveland, with a population of 69,000, principally residential, but including some industries; Maple Heights, population 6,700; Parma, population 16,000; Rocky River, 8,000; Shaker Heights, 23,000; South Euclid, 6,000; University Heights, 6,000.

This, I think, completes a description of the cities in the territory. There are a number of villages, 67 in fact, in the
1013 territory, ten of them of a population more than 2,500, and in their area are important centers.

With minor exceptions, the Company's service area is continuous, that is, the area enclosed by the outline of this map is served exclusively by the Company with four exceptions.

One is the City of Cleveland proper, in which there is located a municipal plant of 50,000 kilowatts, presently

—608—

installed capacity; and in which is being installed an additional 37,500 kilowatts, to bring the total capacity to 87,500
1014 kilowatts. This plant serves 54,000 customers in a spotty area within the corporate limits of Cleveland, had an annual revenue last year of about $3,500,000——

Q. (Interposing) That is gross revenue? A. That is gross electric revenue. I had better add that it would be gross revenue alone, because there is some revenue from the sale of steam.

A second exception, to which I have referred briefly, is the City of Painesville, of 12,000 population, served by its own municipal generating and distribution system, which has a capacity of about 8,000 kilowatts, and serves 4,500

population of in excess of 5,000, located, of course, in the territory outlined in the map? A. Outside Cuyahoga County, there are located in Lake County two cities of 5,000 population and above, both shown in the right center at the South shore of Lake Erie, Fairport; and immediately below it, Painesville. Each has a population of about 6,000. The territory indicated as Painesville is not cross-hatched, however, because it is not served by the Company, having a municipal plant within its own limits. It is one of three
1007 cities in the territory served by municipal generating plants, the other two being the City of Cleveland, and the third, a city by the name of Berea, shown on the map at the lower left-hand portion of Cuyahoga County, where is shown the symbol "BL".

These two communities, then, Fairport and Painesville, each of 6,000, are the principal cities in Lake County. Excuse me, there is another, Willoughby, shown again as a white area, where there is, however, no municipal generating plant, but a municipal distribution system which buys its energy for distribution from the Company. These are the three
1008 cities, then, in Lake County.

To the East, then, in Ashtabula County, is the City of Ashtabula, of 21,000 population, and the City of Conneaut, of 9,000 population.

In Ashtabula there are located docks and facilities for

Lake shipment; it is an important ore receiving and coal shipping center; with shops of the New York Central Railroad; canneries, manufacturing plants, and it is the center of a substantial greenhouse area.

1009

Conneaut is not different in its general character. It, too, is an important Lake shipping port for iron ore and coal, and has incidental manufacturing.

I have made a misstatement on the population of Painesville, and it should be 12,000, rather than 6,000.

Now the third of these counties, to the East, served by the Company, Geauga County, contains no community of 5,000 population.

Chardon is the County Seat of Geauga County, and has a population of 1,800.

1010

In these small communities shown, as Chardon, Burton, Middlefield and the like, the population is not high because they are definitely rural communities, although there is industrial and manufacturing enterprise.

In a town like Chardon, there is located the Chardon Rubber Company; in Middlefield, there is likewise a rubber company, the name of which I don't have available.

That, I think, includes the cities and important villages of the three counties to the East of Cuyahoga.

In Cuyahoga County are located 13 cities of 5,000 population and above. The City of Cleveland proper, about which I

1011

have already talked; the City of Cleveland Heights, of 55,000 population, a residential suburb; the City of East Cleveland, 39,000 population, a residential suburb; the City of Bedford, of 7,000 population, a residential and industrial suburb with several important plants in it; the City of Euclid, up against the shore of Lake Erie, population 17,000, classed as an industrial suburb, where are located such plants as the Chase Brass Company, the General Electric Company, the Addressograph and Multigraph Company, and a number of other

customers, and had a gross revenue from the sale of electricity of about $225,000.

Q. These figures on gross revenue are, of course, for 1939, are they? A. They are for 1939, yes.

The village of Willoughby, which owns a distribution system only, and purchases energy from the Company, serves 1,400 customers, with an aggregate load of 900 kilowatts, and distributed less than 4,000,000 kilowatt hours last year.

The fourth of these exceptions, the City of Berea, in Cuyahoga County, has a municipal generating and distribu- 1016
tion system and serves 1,750 customers, 2,125 kilowatts of capacity, and had an annual revenue last year of about

$114,000.

With these principal exceptions, the territory served is continuous. There are, however, minor additional exceptions in the City of Cleveland where there are three very small utilities, the Cleveland Light & Power Company, the Bradley Electric Light, Heat & Power Company, and the Euclid Doan Power Company.

The first of these, the Cleveland Light & Power Company, 1017
purchases all of its electric energy from the Cleveland Electric Illuminating Company, and distributes to consumers in buildings in a limited area downtown.

The second of them——

Q. (Interposing) Just a moment, if you will. Do you know how many customers the Cleveland Light & Power Company has? A. That company has between 300 and 400 customers in a limited area of this congested downtown district, an aggregate load of 1,200 kilowatts, and a sale of less than 4,000,000 kilowatt hours a year.

The second of them, the Bradley Electric Light, Heat & Power Company, purchases some of its electric energy from the Cleveland Electric Illuminating Company, and generates the rest of it. It serves a few more than 500 customers, again in a compact downtown area, largely in buildings owned by interests which own the power plant, with an aggregate load of 1,270 kilowatts, and an annual energy again less than 4,000,000 kilowatt hours.

—610—

1019 The third of them, the Euclid Doan Power Company, serves an area in the Euclid-East 105th Street district. The number of customers is less than 500, the revenue last year from the sale of energy was about $150,000.

Q. Does it generate its own power or buy it from the Company? A. It does generate some of its own energy, but that which it buys it does not buy from the Company, but buys from the Cleveland municipal light plant.

Now in this area then, with the discontinuities which we have noted, the Company serves a total of 330,000 customers. These customers, as of last December 31, comprised
1020 286,000 residential customers, 42,000 general commercial customers, about 1,800 large commercial and industrial customers, about 100 street-lighting customers, two railways, two other utilities, and about 400 miscellaneous customers.

The Examiner: Does the Cleveland Electric Illuminating Company go into the areas served by these smaller companies which you have mentioned; in other words, does it compete with them?

The Witness: In the case of two of the municipal plaints, Painesville and Berea, the answer is no, we

1021

do not, that in those two municipalities the municipal plants serve exclusively.

In the third of them, in Willoughby, where the new municipal distribution system is owned by the

—611—

village, we do not compete for residential consumers, they serve them exclusively, but we serve the industrial and the large commercial coustomers, such as a factory which the distribution system owned by the municipality is not in a position to serve.

1022

In the City of Cleveland, proper, the municipal plant owned by the City serves a few limited areas exclusively, in which we have no facilities, in which the Company has no facilities, but generally speaking it serves in a competitive area with the Company, where they both have facilities.

In these territories, then, served by these various small private companies, such as I mentioned last, those are in some measure in buildings privately owned, to which, obviously, we have no access, being served by the owners. They are cases of private plants within a single building having been expanded to take care of the adjacent building, and then a third building across the street, perhaps.

1023

In the Euclid Doan Power Company's area, the Company and the Euclid Doan Power Company, compete for some business, and in some buildings wholly served by Euclid Doan Power Company we do not compete.

1024 *Elmer L. Lindseth—By Respondents—Direct*

By Mr. Hamilton:

Q. Now with the exception of these limited spheres serviced by others, the entire area shown on the map is served solely by Cleveland Electric; in other words, there are no

—612—

other utilities in that area selling to others, is that correct? A. That is correct, there are no other public utilities that——

Q. (Interposing) Speaking of electric? A. In the terri-
1025 tory served by the Company, electric public utilities.

Mr. Hamilton: May this document be marked as Respondents' Exhibit 22 for identification?

The Examiner: Let it be so marked.

(The document referred to was marked Respondents' Exhibit No. 22, for identification.)

By Mr. Hamilton:

Q. Will you explain what Respondents' Exhibit No. 22 for identification portrays? A. This sheet shows certain
1026 statistics of the growth of the company. The lowermost curve, the dotted line, is the number of electric customers as of the end of each year, shown in the legend below.

The line immediately above it, the full line, shows the annual peak load in kilowatts. Excuse me, the scale for the lowermost curve is to the extreme right of the chart.

The second curve from the bottom, instantaneous peak load, has its legend likewise at the extreme right.

The third line is the installed aggregate generating capacity of generating plants, with the legend at the extreme

—613—

right.

The fourth, the dash and dot line, shows the total fixed assets of the Company as of December 31, electric and steam, and has its legend the innermost one at the right.

The topmost line shows the net kilowatt hour output from the generating plants on the system, and has its legend at the extreme left of the sheet.

Q. This diagram has been prepared under your supervision? A. Yes, it has.

Q. And the facts shown therein are taken from the Company's records? A. They are. 1028

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 22.

Miss Calkin: No objection.

The Examiner: It is so received in evidence under that number.

(Respondents' Exhibit No. 22 was received in evidence.)

The Witness: We have just referred to the fact that the number of customers of the Company at December 31, 1939, aggregated 330,000. 1029

It will be noted from reference to that lowermost curve that ten years ago, as of 1930, the number of customers was 308,000; about 20 years ago, in 1920, the number of customers was 165,000. That is, in the last 20 years, the number of customers of the company

has doubled.

In the ten-year decade prior to that, however, the number of customers increased from 30,000 in 1910, to 165,000 in 1920, an increase of 5½ times.

1030 In the ten years prior to 1910, the scale is here no longer such that we can tell precisely, but the number of customers as of 1900 was probably on the order of 1 or 2 thousand, an increase of 10 or 15 times in the number of customers between 1900 and 1910.

By Mr. Hamilton:

Q. Has the development shown by the chart in number of electric customers and also in kilowatt hours of output, been
1031 due solely to the growth of the Company's own facilities? A. No, that isn't quite the case. This growth in number of customers and in output is very largely due to an increase in the company's facilities by growth into theretofore unserved areas, but in some substantial measure is due to the acquisition of properties by purchase.

I say "substantial". In the course of the Company's history there have been acquired by purchase public utilities privately owned or municipally owned in an aggregate amount of about $6,000,000.

The present total electric property of the Company is of
1032 the order of $140,000,000, and including retirements, it has comprised about $160,000,000, of which total about $6,000,000

have been acquired at various times by purchase.

So it may be said that of the total property which the Company now owns, or at various times has owned, 4 per cent. has been acquired by purchase, and the other 96 per cent. has been built by the Company and extended into theretofore unserved areas.

The number of these purchases, however, is substantial, 29 systems, either small distribution systems, or in several

cases generating plants, with distribution systems; in some cases transmission lines, such as along interurban lines, or electric railways, have been acquired by purchase.

The nucleus of the system, however, was Cleveland, and the growth was a radial outward growth from Cleveland; as communities surrounding Cleveland began to be more densely populated, as there were demands and requirements for electric service, the system just grew.

Mr. Hamilton: May this document be marked as Respondents' Exhibit No. 23 for identification? 1034

The Examiner: Yes.

(The document referred to was marked Respondents' Exhibit No. 23, for identification.)

By Mr. Hamilton:

Q. Will you explain what Respondents' Exhibit No. 23 for identification portrays? A. This series of three maps shows the relative size of the area served by the Company

—616—

as of three periods. 1035

Q. Now this series of three maps has been prepared under your supervision? A. Yes, it has.

Q. The facts which are the basis of the maps have been taken from the records of the Company? A. Yes, from the Record Department records.

Mr. Hamilton: I offer this exhibit in evidence as Respondents' Exhibit No. 23.

Miss Calkin: No objection.

The Examiner: The three maps may be received as Respondents' Exhibit No. 23.

(Respondents' Exhibit No. 23 was received in evidence.)

By Mr. Hamilton:

Q. Are all three maps, Mr. Lindseth, to the same scale? A. Yes, these three maps are to the same scale, which is about 6 miles to one inch.

The lowermost map, the territory as of 1940, is precisely the area shown on Exhibit 21, the territorial system map
1037 which we discussed earlier in the testimony.

As of 1911, which date was chosen because it represented the point at which the Company changed from a single power plant company to two power plants, transition was from a radial distribution and transmission center with a single plant as the center, to two power plants jointly serving the territory, in which the area served is about 200 to 250 square

miles, or one-eighth of the present territory served.

The middle map shows the territory served as of 1925,
1038 when the company built another of its generating plants, and marks the transition between radial system in these original two power plants, where the transmission and distribution was radially outward, to the point at which the Company began to build a high tension transmission ring surrounding the territory, and began serving customers radially inward as well as radially outward. That area is about 400 square miles, on the order of one-quarter of the present territory served.

The last map, of course, represents the system as it is today.

Q. Have you given your approximation as to the number of square miles in the area shown for 1911? A. Oh, yes; 200 to 250 square miles, about one-seventh to one-eighth of the present territory.

Q. Did the territory shown as served in 1911 comprise the entire Cuyahoga County? A. No, it did not; Cuyahoga County has an area of 450 square miles. The estimated 250 square miles served in 1911 is then something of the order of 55 or 60 per cent. of Cuyahoga County. The facilities of the Company did not extend beyond Cuyahoga County, 1040 but did not cover all of Cuyahoga County.

By 1925, the limits of the Company's facilities had not

—618—

yet extended beyond the county line, but neither, yet, had those facilities covered the entire county. 400 square miles were served in 1925, and the aggregate area of the county was 450 square miles.

Very shortly after 1925, the Company served not only all of Cuyahoga County, but began a process of expansion which, within four years, expanded the Company's territory from that shown as existing as of 1925, to the area below it. That 1041 is, all of the territory served in 1940 was likewise served by the end of 1929.

Now this period of expansion began in accordance with a well-defined and rather well-developed plan for expansion enunciated just before 1925, and was of two important types.

One was this acquisition of ear by purchase; second, was a tremendous expansion of facilities in the territory that had theretofore been unserved.

To go back a little to the character of this territory, Cleveland was the trade center of this entire area. The dol-

lar volume of sales was very substantial. Last year the wholesale trade in Cleveland was $700,000,000; retail sales were $400,000,000; and the people in the territory trade in Cleveland for department store sales, wholesale jobbers, factory branches, and the like; and similarly, Cleveland is a substantial market for the products raised in these counties to the East, the agricultural products finding their market in Cleveland.

—619—

1043 The Cleveland newspapers are circulated throughout the territory, and serve substantial portions of it. It was realized by the Company that this was an economic unit which could best be served by a company, a single company, preferably The Company, the Cleveland Electric Illuminating Company, and so it began in 1925 with its plans for expansion.

Shortly after the North American Company acquired control of the Cleveland Electric Illuminating Company, these plans to extend service were made. As early as 1924, a site was purchased at the extreme Western end of the ter-
1044 ritory for the building of the Avon plant. This site was acquired before that territory was served by the Company.

Similarly, right-of-way was acquired for a high tension transmission line to run to the South and to run over to the West.

Events then followed rather rapidly. It was the middle 20's, and the needs for electric service were extremely great in the territory. The potentialities for business were very marked. The exent to which the territory was served was

negligible, and that service which was there was, by today's standards, of the very poorest class of service.

—620—

Customers were served from either very small, isolated generating plants or, in keeping with the times, customers bought energy from the electric interurban electric railways running through the territory and distributed that energy through systems which they, themselves, had built and they were strictly bailing wire systems.

So that the standard of service was bad, the level of 1046
rates was high and the need for unification of the facilities was very, very marked.

By this process of acquisition of properties the Company in about four years acquired all of this territory, built high tension transmission service lines, built the necessary substations and distribution system and altered the service picture completely.

Q. By this period, "four years," are you referring to 1925 to 1929? A. Yes, I refer to 1925 to 1929.

The nature of these properties acquired may, perhaps, 1047
be shown by statements as to the size of some of these properties.

Mr. Hamilton: Mr. Examiner, would it be appropriate to have a recess at this time?

The Examiner: I think so. We will have a short recess.

(Whereupon, a short recess was taken.)

The Examiner: You may proceed.

—621—

1048 *Elmer L. Lindseth—By Respondents—Direct*

By Mr. Hamilton:

Q. You testified, Mr. Lindseth, that the Company made a number of acquisitions to the electric property during the period you referred to. What was the character of this electric service in these territories so acquired? A. Actually, the Company bought many of these properties during this expansion period of 1925 to 1929 at the specific request of either the consumers served by these properties purchased
1049 or in some cases by the owners of the properties. The period was one when the decline of electric interurban and railroad transportation had already set in.

These interurban lines were in weak financial condition as a result of which the revenue obtained from the sale of electric energy was not even devoted solely to the electrical portions of the business, but was in part bailing out of the transportation phases.

For example, one of the properties purchased, the Cleveland, Painesville & Eastern Railroad had its generating plant at the extreme west end of the system and extended eastward
1050 along an interurban line for fifty miles. All the power customers were served from a single transmission line along that right of way and in the event that that line had to be taken out of commission for maintenance, all customers to the east of the maintenance point were without service until the line was fixed.

—622—

Numerous private small companies built distribution lines down roads and into villages adjacent to that interurban right of way, but the character of their construction was very poor, their personnel was decidedly limited because of

the number of customers and the gross revenue just couldn't justify a maintenance or a service organization.

In almost no case did any of these twenty-five acquired properties have twenty-four hour maintenance service. If a transformer were burnt out, it would be repaired the next day by the construction personnel. In the event a primary line was down, it was not even cut loose; it probably just burned itself clear and they let it be until the next day. This Cleveland, Painesville & Eastern Railroad operating through a subsidiary in its electric business, handled its 1052
trouble work and consumer service work by the regular construction crew, either before they went to the job in the morning, at noon, or after the construction job was finished in the evening.

There was no trouble organization through the night. There was no trouble organization on Saturdays and Sundays. In the event of major storms, substantial lengths of pole line would be blown down because the construction standards were poor and the period required to restore service was necessarily great because the personnel was so decidedly limited. 1053

—623—

In certain cases, it is recorded in the records of the Company that they pressed into service wiring contractors to help them clear up major cases of trouble. It was strictly a low class of service. As a result requests came to the Company because of the knowledge of consumers of the character of service rendered by the Company, there came these requests for the Company to acquire these distribution systems and put them on the Illuminating Company's standard of service basis.

1054 *Elmer L. Lindseth—By Respondents—Direct*

As illustrative of one of these purchases, I think we can talk about the very first one in this series. That occurred in 1925, in October of 1925. The Company acquired the West Claridon Light & Power Company. The number of customers was just a few more than twenty. They were served on a rural highway leading into Chardon and the purchase price for the entire company was $4,095.00.

The next purchase in December of that year, the Middlefield Electric Light Company, was bought for $20,700.00. Ob-
1055 viously the size of the companies and the character of their equipment could not have been of very high caliber for those prices in those days.

One of these plants that was acquired—the Orwell plant—had a small oil engine serving it and after the Company had acquired the plant, but before the property could be taken over, the engine caught fire and burned.

Numerous purchases followed in close sequence. In February of 1926, the company purchased the Burton Public

Service Company serving the Village of Burton at a price of
1056 $12,500. In April, 1926, two months later, the Thompson Light & Power Company serving Madison and Montville townships, for about $15,000.00. This company had nine and a half miles of transmission line, a little over five miles of distribution line, a hundred and five customers, and 55 k. v. a. of transformer capacity. The price paid was about $150.00 per customer.

Shortly after, in the same month, the company acquired the Suburban Utilities Company serving Geneva and Saybrook townships, at a little less than $30,000.00. This property had fourteen miles of transmission line, nine miles of

 1057

distribution line, 350 customers and about 400 k. v. a. transformer capacity.

The company, then, in March of 1926, made a major purchase—the Municipal Light Plant in the City of Conneaut. Conneaut, you recall from the map, is at the extreme northeastern portion of the system, near the Pennsylvania line and on the south shore of Lake Erie. The Municipal Plant in Conneaut served Conneaut City, the township, and North Kingsville Village, for which the company paid $455,000.00 and acquired a generating plant, transmission line and dis- 1058
tribution facilities.

The Conneaut plant, as shown from the inventory, had thirty-one miles of transmission lines, thirty-six miles of distribution lines, thirty-four hundred customers, and 2,700

—625—

k. v. a. of transformer capacity. This was a rather significant purchase and was classed as a major one in the period.

In the fall and winter of that year, 1925, the company purchased the Chardon Plant, the Village of Brecksville, the Village of Independence, the Village of Mayfield—that is, the distribution facilities in these villages—the Village of Rich- 1059
mond Heights, the facilities in the Village of Valley View, and bought the plant of the Chesterland Light & Power Company.

Q. Now, would you indicate the relative importance of those purchases by giving us the maximum purchase price of any of the systems or distribution lines you just referred to? A. The price paid for this series of five purchases ranged from $10,500.00 for the distribution facilities in the Village of Mayfield, to $39,000.00 for the distribution facilities in the Village of Brecksville. These were practically contiguous

1060 *Elmer L. Lindseth—By Respondents—Direct*

suburbs in the Cleveland suburban area, and were areas in which the municipality had built the distribution system while buying energy from the Cleveland Electric Illuminating Company.

There then followed, in 1926, the important purchase of the Cleveland, Painesville & Eastern Railroad Company about which I have discussed the service, together with a subsidiary of it, the United Light & Power Company.

—626—

1061 This was purchased for $1,400,000.00. In addition to the distribution facilities, the company acquired right of way along the railroad for a 33,000 volt line, to serve that territory east of Cleveland in Lake and part of Ashtabula Counties.

The inventory of the United Light & Power Company shows sixty-one miles of transmission line, twenty-seven miles of distribution line, about 2,400 customers, and more than 2,100 k. v. a. of transformer capacity. The parent company, the Cleveland, Painesville & Eastern Railroad Company, had 179 miles of transmission lines, 75 miles of distribution line,

1062 5,000 customers and 4,400 k. v. a. of transformer capacity.

This was a rather substantial purchase and extended the company's territory very quickly far into this eastern territory by having acquired the right of way for transmission line and the customers along the transmission line practically to the eastern extremity of what now is the entire territory served.

Shortly thereafter, the company acquired—and this is in April and May of 1926—the Grand River Electric Light & Power Company property, the East Ohio Power and Light Company property, for $145,000.00 and $36,000.00, respec-

tively. Then followed in the summer of 1926, the Village of —facilities owned by the Village of Jefferson, the facilities or properties of the Lake Erie Power & Light Company, and some customers of another railroad—the Cleveland, Paines-

—627—

ville & Ashtabula Railroad.

Then, in the fall of 1927, the company negotiated for the purchase of the municipal plant in the City of Ashtabula. The company, by this time, had begun to serve practically all of the territory with the exception of the City of 1064 Ashtabula.

Q. Practically all of the territory shown on Exhibit 21, is that what you mean? A. Yes. On Exhibit 21. It should be understood that they served it quite inadequately because the facilities hadn't yet been extended, but it was the sole supplier of energy in the territory.

By July of 1928, after an election of the voters in the City of Ashtabula, the company bought the municipal plant for $2,340,000.00. The company then took over the plant's customers, took over the generating plant, and all of the distribution system. 1065

A few years after, in 19—late in 1930, the company built a very important generating plant in the Ashtabula township and after that plant was built, the former municipal plant was dismantled.

The acquisition of the Ashtabula municipal plant added 6,900 customers, 115 miles of transmission lines, and 11,600 k. v. a. of transformer capacity.

There then followed, in this area, the purchase of a few

—628—

1066 more properties, the Chagrin Valley Electric Company, quite close to Cleveland, and then a second or third interurban line, the Cleveland Southwestern Railway Light & Power Company. The price paid for the latter was $300,000.00.

Q. The last named company you referred to supplied electric service as well, did it A. Yes, it did. It served not only its own operations, but consumers as well.

Now, the company, at the time of these purchases, had been selling energy throughout its territory at a maximum
1067 rate of five cents per kilowatt hour. The company had, prior to that, for a great many years, adhered to the practice of having a single uniform rate structure throughout the territory, and, of course, the immediate effect of the acquisition of these numerous small properties was to immediately put into effect the company's uniform rate schedule, so that in these years, the reduction in rates to these customers transferred to the company's lines was very, very marked.

For example, in the Village of Chardon, consumers had been paying as high as eleven cents per kilowatt hour when
1068 the company took over the Chardon plant. This rate was immediately reduced to five cents. Similarily, the consumers of the Cleveland, Painesville and Ashtabula Railroad Company in Madison and Saybrook, had been paying eleven

cents subject to a discount of two cents for prompt payment. Their rates were reduced to five cents. Customers of the Northeastern Ohio Power and Light Company had been paying 12½ cents per kilowatt hour maximum. They were reduced to five cents.

1069 Consumers of the Grand River Electric Light and Power Company, serving rural communities in Ashtabula County, including Austinburg and Rock Creek, paid thirteen cents per kilowatt hour for the first twenty kilowatt hours. That rate was reduced to five cents.

Similarily, the maximum rate for customers of the Lake Erie Power & Light Company, serving Avon Village and Avon Lake and Bay Village, had been ten cents prior to purchase, was immediately reduced to five cents.

1070 In Burton, the consumers of the Middlefield Electric Light Company, one of the very first companies acquired, had paid seventeen cents per kilowatt hour, up to twenty-five hours, less a five per cent. discount for cash payment.

Now, obviously, under such rates, and with the class of service that had been furnished in this territory, the average use per residential consumer was necessarily low because, first, the price was prohibitive; second, the service was inadequate; and third, generally speaking, there had been no promotion.

1071 Even quite adjacent to Cleveland, in residential suburbs such as served by the Chagrin Valley Electric Company and the Solon Light & Power Company, consumers had paid ten

—630—

cents per kilowatt hour.

In Dover, Fairview and North Olmsted—those are just adjoining suburbs in the City of Cleveland—consumers of the Cleveland Southwestern Railway & Light Company had paid ten cents for the first kilowatt hours purchased.

In Geneva, Madison and Unionville, rural communities rather far removed, they had paid ten cents. At Jefferson,

1072 the rate for the first ten kilowatt hours had been a dollar and a quarter. At Orwell, where the company bought the oil engine plant, the starting rate had been 14 cents for ten kilowatt hours and 11 cents for the next sixty-five.

The Suburban Power Company, the initial rate was 20 cents per kilowatt hour for the first ten kilowatt hours. However, in these adjoining suburbs, where the village had built its own distribution system and bought energy at wholesale from the company, the maximum rate was identical with that
1073 of the company; namely, five cents per kilowatt hour.

This rate prevailed in Brecksville, Independence, Mayfield, Richmond Heights, and Valley View.

Now, immediately on acquisition of these properties, the company rehabilitated the distribution lines, replaced obsolete, overloaded, and inadequate equipment, and linked the territory together with a 33,000 volt transmission line.

Q. Were the reduced rates which the company then had

in effect, made applicable to service in these cities and towns
1074 you have referred to, immediately upon acquisition of the properties? A. Yes, immediately. On the acquisition of title and the transfer of the property and consumers from the former owner to the company, the rates were made immediately applicable, even in advance of the reconstruction of the facilities or the replacement of the obsolete property.

The uniform rates of the company were made effective throughout the territory, automatically, as a matter of fact. Now, in this territory, the response to the improved service rendered by the company, the lowered rates, and the excellent opportunity to improve the extent to which electricity

 1075

was used by the consumers through adequate promotion, the effect of these things was immediately evident.

At the end of 1926, the company had, in these three territories, shown at the extreme right of one of these maps, Exhibit 21, for example, the territory to the right of a point marked in the lake, Willowick—this territory comprises three counties—the number of customers in those three counties at the end of 1926 was about 10,700.

Q. Those are customers of all classes? A. Those are customers of all classes. By the end of 1929, when the acquisition of new territory was complete, the number of customers in this area had reached 19,100. By 1939, ten years later, 1076

without the acquisition of any additional territory, the number of customers had increased to 24,500, which increase was 28 per cent.

Now, during this same ten years, from 1929 to 1939, the residential sales of energy in this territory had increased from 11,000,000 kilowatt hours to 25,000,000 kilowatt hours —an increase of 127 per cent. The average use per residential consumer in the same period and in this territory increased from 577 to 1,021—an increase of 77 per cent. 1077

Q. Your figures are number of kilowatt hours, are they? A. Yes, the figures are numbers of kilowatt hours per residential consumer per year. The latter value—1,021 kilowatt hours per consumer for these three rural counties is in excess of the corresponding average figure for the company as a whole, which value, as of 1939, was 924 kilowatt hours per consumer.

1078 *Elmer L. Lindseth—By Respondents—Direct*

That is, the average use of 25,000 residential consumers in these three rural counties was in excess of the average use per residential consumer throughout the territory.

This is quite the more striking when it is realized that in a city like Ashtabula, during the interval from 1930 to 1940, the population declined about 8 per cent., again due to decentralization of population. During that period the number of customers served by the company in the city of Ashtabula, however, increased 4 per cent., from 6,900 to about 7,200.

1079 —633—

That is, with a decrease in population, the number of customers served was increased, illustrating the making available of service to people in the lower income brackets and people with inadequately wired houses at the beginning of the period.

The total number of company's meters in the eastern division in 1939 was 32,500, of which the number of residential consumers was 24,500.

Q. Here, at the end, Mr. Lindseth, you are speaking of the eastern three counties in the territory? A. Yes, sub-

1080 stantially the eastern three counties. The boundary is a little bit irregular.

Q. Are there geographic factors in the territory served which have encouraged the growth of industry in the territory? A. Yes, generally speaking, my discussion up to this point has related to residential consumers, but it is important to note that this is primarily an industrial territory. Even in these rural communities, the cities like Ashtabula, Conneaut and Fairport are important industrial and manufacturing centers.

1081

Each has important coal and ore docks; each has important factories and not only that, but the conditions in the territory are favorable to the increased industrial expansion within the limits of the company's area served.

Cleveland is primarily a town, the industrial activity of which centers on the metal trades, the making of steel, the

—634—

fabrication of steel and steel products, of brass and other metals, with incidental and associated industries making machine tools and the like. Within a radius of five hundred 1082
miles of Cleveland is this important industrial market, and many of Cleveland's customers for its industrial products are located in such cities as Detroit and Pittsburgh.

Cleveland is a very large manufacturer of automotive parts, for example. As a result of these conditions in the territory favorable to industry, and although the emphasis may be said to be on metals and metal working industries, Cleveland does enjoy a wide diversity of manufacture.

Q. Now, are there other factors, other geographic factors, which encourage the growth of industry? Is the lake, 1083
itself—Lake Erie, itself, a factor in the encouragement of industry? A. Yes, the transportation facilities afforded by Lake Erie have definitely contributed to this industrial development by making available at very low cost, iron ore, which with the availability of suitable coal from western Pennsylvania and West Virginia, has made rather natural the development or iron and steel in this northeastern Ohio territory. The rail facilities are such as to contribute to the development industrially, the proximity to markets

1084 *Elmer L. Lindseth—By Respondents—Direct*

makes it attractive for industry to locate in this area, centrally located to its markets.

—635—

In the 1937 Census of Manufacturers were listed three hundred and fifty types of industry, of which 220 are represented in the territory of the company.

Cuyahoga County has about 1 per cent. of the nation's population. Yet it produced almost 2 per cent. of the products manufactured in the United States in 1937. The total
1085 value of the products of the manufacturing industries in Cuyahoga County in 1937 was more than a billion dollars, being a billion and seventy-two million thousand—a billion, seventy-two million dollars—and in the City of Cleveland
1 $967,000,000.00.

In Cuyahoga County, the center of the district, there are more than 2,200 manufacturing establishments and, as we noted in connection with population statistics, although this is a very high concentration of industrial activity within Cleveland, there is a well-defined tendency for industry to
1086 decentralize by acquiring sites in industrial and manufacturing suburbs, where land is available, where home sites are available for workers and industry is decentralized through the entire territory.

The diversity is, of course, an advantage to the company in affording opportunities to serve loads in an aggregate load factor beneficial to the company and conducive to reduced costs.

As indicative of this diversity, there may be noted the character of the company's largest consumers. The largest

—636—

customer of the company is the Cleveland Railway Company which is the street railways serving the City of Cleveland, whose demand last year was in excess of 38,000 kilowatts and the kilowatt hours of energy purchased, 124,000,000.

Q. Cleveland Railway Company is a non-affiliate of the company, is that correct? A. Yes. The Cleveland Railway Company is owned by interests quite separate from those owning the Cleveland Electric Illuminating Company. The second largest customer is the American Steel & Wire Company, a steel products and a steel manufacturing company, making wire, rods, bars, sheets, strips, and the like, with a demand in excess of 17,000 kilowatts and energy purchases in excess of 85,000,000. 1088

The third largest customer was the Republic Steel Corporation, making similar steel products, and iron and steel, with a demand of 21,000 and an energy use of about 70,000,000 kilowatt hours.

Then, there follow such companies as the Chase Brass & Copper Company, making brass and copper products; the Cleveland Union Terminals Company, operating the electrified railroad terminals; the Otis Steel Company, making steel and steel products, strips, sheet and plate steel; the Aluminum Company of America; the Fisher Body Company, the City of Cleveland—the Easterly sewage disposal plant is one of the company's very largest customers—the Willard Storage Battery Company; the Industrial Rayon Company; 1089

the Standard Oil Company; the General Electric Company, the wire works; the Republic Steel Corporation, their Upson works; the Ohio Rubber Company; another plant of the

General Electric Company, their Nela Park offices and laboratories, the Thompson Products Company, making automotive and aircraft parts; the White Motor Company, making trucks; a third plant of the General Electric Company, the Incandescent Lamp Bulb Works; and the Eaton Manufacturing Company, making automotive parts.

These are representative of the diversity of industry and a substantial number of these plants that I have mentioned are not within the municipal limits of the City of Cleveland.

1091 Q. Even with this diversity of industry of which you have spoken, is there a similarity of service needs among your industrial consumers? A. Yes, there is. That is, although the products of industries are widely diversified as to character, industry needs dependable electric service with adequate control of voltage and frequency for precise manufacturing operations, prompt restoration of service, and although these industries are diversified, they do require rather uniform standards of service.

The diversity is of distinct advantage to the company in reducing costs by improving load factor which advantages

1092 redound to the customer in the form of improved service at

reduced rates. This uniformity may be seen, for example, from the fact that as far east as Conneaut, the character of Conneaut is not essentially different from the character of Cleveland. It is a lake port with docks as has Cleveland. It has small manufacturing plants as has Cleveland. It has railroad shops as has Cleveland, and the same may be said for such cities as Ashtabula and Fairport.

So that this is a territory which is homogeneous to the point of being throughout industrial minded, with incidental

agriculture, but it is diversified by having a wide variety of industrial and commercial needs.

It enjoys the benefits of diversity, but it enjoys the benefits of uniformity.

I mentioned, for example, the cities of Geneva—excuse me—of Conneaut, Ashtabula and Fairport, but in some of the smaller cities such as Geneva, the population of which is much less than that of the others, there are located such plants as the Geneva Metal Wheel Company, and the American Fork & Hoe Company and the Champion Hardware 1094
Company, whose needs and requirements are identical with enterprises even much larger in the City of Cleveland.

Even in some of these very rural territories, such as, for example, the City of Middlefield down near the lower end of the limits, a town of a very small population, in the middle of strictly a rural community, there is a rather sub-

—639—

stantial manufacturing plant—the Johnson Rubber Company—whose demands for energy last year were almost 2,000,000 kilowatt hours; and not only is industry now in that territory, but industry is definitely moving more and 1095
more into the territory and it is extremely likely that the trend will continue because there are many advantages in the territory.

This territory is uniform as to climate, being quite close to the south short of Lake Erie, and this climate encourages the sale to residential consumers of winter air-conditioning. It is not especially favorable to summer air-conditioning. Cleveland has a——

Q. (Interposing) Why is that? A. The number of days in the year in which air-conditioning is required in Cleve-

land—I am speaking now of summer cooling—is somewhat less than thirty and the economic attractiveness to owners of property in which it is contemplated to install air-conditioning is not such that they can afford to install very substantial amounts for as few as thirty days in the year, so that the summer cooling air-conditioning market is probably rather limited in Cleveland.

In the winter time, however, since Cleveland is in one of the cloud belt areas—one of the two important cloud belt
1097 areas in the country—and sunshine is decidedly limited in the winter time, there are distinct needs for adequate lighting in the community and the use of winter air-conditioning

—640—

in the form of filtering, humidifying and similar needs.

The normal mean temperature in Cleveland is 49 degrees and the mean maximum temperature is 56. These are data from the weather bureau.

In this rural territory to the east and a small portion to the west, the company has 1,300 miles of rural distribution line, 16,000 rural customers, of which 4,600 were rural
1098 farm customers.

In these statistics, rural is defined as the area outside these incorporated municipalities. This rural area is traversed by 2,200 miles of highways over which 1,300 miles of rural distribution line have been built and maintained by the company, representing a coverage of about 60 per cent. Including urban farms, that is farms in incorporated areas, the aggregate number of farm customers served was 7,700 as of December of last year

Based on the company's statistics, the number of potential farm customers, urban and rural, now taking service in

the areas served by the company, is 50 per cent. and the number of potential farm customers, urban and rural, to whom service is available in the territory is 63 per cent.

There we see as a summary of the territory served by the company, a compact area, 1,700 square miles; maximum dimension, one hundred miles; highly industrialized, with about 60 per cent. of the area unincorporated municipalities, defined as rural in which there is a very substantial avail-

—641—

ability of electric service to these rural customers. 1100

Mr. Hamilton: This is a convenient breaking point, Mr. Examiner.

The Examiner: All right.

We will recess for lunch until 2:00 o'clock.

(Whereupon, at 12:15 o'clock p. m., the hearing was recessed until 2:00 o'clock p. m. the same day.)

—642—

1101

1102 *Elmer L. Lindseth—By Respondents—Direct*

AFTERNOON SESSION.

(The hearing was resumed in room 1102 at 2 o'clock p. m.)

The Examiner: Let us resume. You may proceed, Mr. Hamilton.

Whereupon, ELMER L. LINDSETH resumed the stand and testified further as follows:

1103

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Lindseth, in order to get a general overall picture of the properties which comprise the electric service properties of the Company, would you give us a brief general description of the electric facilities owned and operated by the company? A. Referring again to the system map, Exhibit 21, the electric facilities for the service of this area aggregate, in book cost, about $140,000,000. These properties consist of a generating system with three power plants, one
1104 as shown in the left center of the map at the point Lake Shore, the symbol "LS"; a second, at the westerly edge of the system marked Avon, symbol "AV"; and a third near the eastern terminus of the transmission system, near the Pennsylvania border, Ashtabula—the power plant is so named and has, as its symbol—"AT". These three generating plants aggregate in capacity 520,000 kilowatts and represent an in-

vestment in excess of $44,000,000. All of them are located on the shore of Lake Erie.

1105

These three generating plants are interconnected by a 132,000 volt transmission system shown as the heavy diagonal line running southwest from Ashtabula plant around the lower edge of Cleveland and up into the Avon plant.

Q. Now, in order to locate that clearly, would you state whether that line runs through the section marked South Russell? A. Yes, that begins at Ashtabula, the Ashtabula plant, circles the city of Ashtabula, runs diagonally southwestward and just to the northwest of the village of Chardon; proceeds downward through the village of South Russell, 1106
and thence westerly through Avon Lake and Avon. This is the 132,000 volt transmission ring.

Near the center, or the left center of the map, there proceed to Lake Shore plant two lines from the point indicated as "PV", the Pleasant Valley switching station, by two routes, to the two points labelled by their symbols—"KO" and "GT", which are, respectively, Oak Street and Grant, step-down transmission stations.

From these two points into Lake Shore, as shown by the heavy dotted line, there is a 66,000 volt underground system which completes the interconnection between the three power 1107

plants.

The underground system is made necessary by the requirements of a heavily built up urban center where overhead, high voltage transmission lines, are impracticable.

Q. That is in the city of Cleveland proper? A. That is in the city of Cleveland proper.

The point marked "KO" on the map, the Oak Street switching station, is on the city limits borders. This 132,000

volt transmission line comprises 454 circuit miles of steel tower line and the underground portions shown, comprise 20 miles of underground cable.

The switch house at the Lake Shore plant also serves as a bulk load supply center to numerous sub-stations, and the switchhouse at the Avon plant, at the westerly end of the system, likewise serves to feed certain sub-stations shown, one of them right adjacent to the site, with the symbol "LK".

The Lake Shore sub-station, in addition to supplying dis-
1109 tribution sub-stations, also serves some industrial customers directly and some railway customers. There are located in this major transmission system 6 step-down transformer stations, located beginning again at the easterly end of the system, one at a point marked "SN" which is Sanborn; a second one, again at the center of the map in the southeast portion of Cleveland, marked "NF"; and the third and fourth we have discussed, Oak Street and Grant; the fifth, Clinton, on the west side of Cleveland, symbol "CL"; and the sixth shown on the underground system into Lake Shore as "NB",

—645—

1110 Newburgh.

This system then comprises generating plants, transmission lines, and transmission step-down sub-stations, and constitutes the main interconnected generating facilities.

The next step in getting the energy to the customers is a sub-transmission system at lower voltage, to get energy from the interconnected power plant system, with its associated transmission lines, to the sub-stations themselves, and this sub-transmission system consists of 11,000 volt underground cable, and 33,000 volt underground cable and overhead transmission.

The next step in getting the energy then to the consumer is the sub-station system itself, which comprises 53 alternating current distribution substations and four direct current sub-stations. These have an aggregate capacity of 52,000 k. v. a. and have a wide range of capacity from 30,000 kilowatts down to 300 kilowatts.

From the sub-stations there then radiate distribution facilities to the ultimate consumer, consisting of a 2,300 volt and a 4,600 volt alternating current distribution system, 60 cycles, three-phase, and in the densely populated downtown 1112
section of Cleveland, a small area of 1¼ square miles of direct current distribution within the city itself.

There is also served a street lighting system, or a number of such. The company has 99 street lighting customers.

—646—

The aggregate number of street lamps is some 21,000, and these are in turn served from either distribution sub-stations or the distribution system itself.

We see then as physical property the generating plants, connected by a transmission system, with step-down transformer sub-stations, from which, through a sub-transmission 1113
system, the sub-stations themselves are served. From the sub-stations the service is carried to the consumers through the distribution system.

To supplement these electrical properties there are required a substantial amount of general purpose facilities, offices at nine locations, warehouses and storerooms at 16 more, garages at 10 locations, tests and research laboratory, 7 in number, and 4 shops.

Further than this, the physical property includes a substantial amount of transportation and construction equip-

1114 ment, principally used in service, embracing, for example, more than 200 trucks, more than 100 trailers, air-compressors, cranes, diggers and the like. It is this property that I will describe under the electric facilities and the miscellaneous purpose facilities.

Q. All right. Turn now, specifically, to the generating stations? A. I have mentioned the three generating plants, the oldest of which is the Lake Shore plant, originally built in 1911, but the oldest portions of which now surviving were

1115 —647—

first built in 1914.

This plant is at East 70th Street in Cleveland, at the lake front, and now aggregates 180,000 kilowatts of capacity.

The Avon plant, next built, had its first section put into service in 1926. Additions in 1928 and 1929 now make it aggregate 140,000 kilowatts of name plate capacity.

And the newest station, Ashtabula, four units of 50,000 kilowatts capacity each, or a total capacity of 200,000 kilowatts. The machines were installed in 1930, 1931, and 1938.

Q. Do you have any other additional generating capacity

1116 outside of the three plants you specifically named? A. There is one incidental source of energy at a plant in downtown Cleveland, the Canal Road station, which, in the early period of the company's history, was an important generating plant, but which today is primarily a supply point for steam heating, but in which does survive a single direct current generator of 3,750 kilowatts capacity. This capacity has not been included in the system figures which I have listed, primarily because it is an adjunct to the steam heating system and is not regarded as firm capacity for the electric system.

Q. Is it actually operated? A. Oh, yes, it is. When requirements for steam are such that it is economical to run this generator, it is operated. The period of its operation

—648—

is almost entirely confined to the wintertime when the steam can be utilized for the steam heating distribution system.

In a system of this character, the dependable capacity at which the plants can operate is of at least as great importance as the nominal capacity of those plants. The figures which I have given are name plate ratings on these machines, 1118
but in conformity with the practice which has prevailed for some time in the company's system, these machines are rated for operating purposes at their dependable capacity, as revealed by periodic tests, and their dependable capacity exceeds the name plate capacity.

Q. By how much? A. The machines are bought on rather a conservative basis, and the 520 kilowatt of name plate capacity, which I have mentioned, is, for operating purposes, 590,000 kilowatt of dependable capacity; making allowance for the loss of equipment at time of peak load, in an amount
equal to the largest turbine on the system, 60,000 kilowatts 1119
at Ashtabula, based on its dependable capacity, and the further loss of a 30,000 kilowatt machine in Lake Shore plant, the present equipment in the power plants is adequate for a peak load of 500,000 kilowatts—this after providing the necessary spare.

Q. The name plate ratings you have given are of units

—649—

now actually serviceable and available for operation, is that

correct? A. Oh, yes. The oldest of those units was installed in 1914 and was rebuilt in 1929. The capacity mentioned is all definitely available and is all dependable and up-to-date capacity.

Q. It does not include any units which may be under construction or which may be contemplated? A. That is correct. There are planned to be installed in an extension to the Lake Shore plant now being built, a 60,000 name plate rating generator to be installed in the spring of 1941, and a
1121 second similar unit to be installed in the spring of 1942. This addition of 120,000 kilowatts of capacity will make the system capacity as of 1942 total 640,000 kilowatts of name plate rating of equipment.

The peak load experienced to date has been 436,000 kilowatts in the fall of 1939. It is expected that the load to be realized in the fall of 1940 will be of the order of 465,000 to 475,000 kilowatts.

As I have explained, the dependable capacity of the system at the moment is adequate to carry loads of 500,000 kilowatts. So that the system is adequate, not only for the loads
1122 anticipated for the fall of 1940, but it is likely that the system capacity now installed would be adequate for loads to be encountered in the fall of 1941.

—650—

However, capacity additions which I have described will be available definitely by the fall of 1941, at which time the system capacity will be definitely above the 500,000 mark.

Q. What are the factors, Mr. Lindseth, leading to the location, the choice of the actual location of these generating plants, the sites? A. The important raw materials in the

1123

generation of power are coal and condensing water, and with the water sources available in Cleveland, there is no location for a large power plant other than on the shore of Lake Erie.

Rail facilities are important, as are facilities for the storage of coal, and although the Lake Shore plant is within the corporate limits of the city of Cleveland, it is in an industrial area in which is available adequate space for the storage of coal and it is located in close proximity to adequate railroad facilities.

1124

Similarly, the Avon plant is located for availability of water, proximity of railroad connections, and adequacy of space for storage of coal.

Ashtabula is similarly chosen. There are additional factors having to do with the suitability of the site from a foundation point of view, and the necessities of excavation. The Ashtabula site happened to have been chosen in some substantial measure because of the foundation and excavation conditions. It was at a point where piling, sheeting or other

—651—

expensive foundations would be unnecessary, where the ex- 1125
cavation would be a minimum because of the erosion of the cliff at the shore of the lake, and at a point where railroad connections could be made to the plant from the main line of the New York Central Railroad with a minimum number of highway crossings.

These generating units that we have described have been built, all of them, between 1914 and 1938. The single unit installed in 1914 of 20,000 kilowatt size was later rebuilt to modern steam conditions and is more modern in its characteristics than the date would indicate.

Q. Did you say 1940? A. 1914, I meant to say. That unit is Lake Shore No. 7.

Q. Will you state now the size of the individual units now serviceable at each of these three locations? A. The first of those at the oldest plant would be this unit just described, Lake Shore No. 7.

Two other units in the same station, Nos. 8 and 9, were installed in 1919, and are each of 25,000 kilowatt size.

Two additional units in that plant, installed one in 1921
1127 and one in 1923, are each of 25,000 kilowatt size and are station units Nos. 10 and 11.

Two units, both installed in 1924, known as Nos. 12 and 13, in that station, are each of 30,000 kilowatt size.

—652—

The aggregate of these 7 units then is 180,000 kilowatts at Lake Shore plant.

Avon plant was built in 1925 and 1926. The first two units, Nos. 1 and 2, began operation in the fall of 1926 and each is of 35,000 kilowatt capacity.

Unit No. 3 was installed two years later in 1928, and
1128 unit No. 4 in 1929, and each of the latter two is similar to the first two.

The station then comprises 4—35,000 kilowatt units with the aggregate name plate capacity of 140,000 kilowatts.

Ashtabula plant was built in 1929, and 1930. The two units, Nos. 1 and 2 in the plant, each 50,000 kilowatt name plate capacity, began service in November of 1930.

Unit No. 3 began only a few months later, in February of 1931, and is of similar size.

The last unit was installed in February, 1938, and is a duplicate of the first three in capacity, so that the aggre-

gate capacity of the plant is 200,000 kilowatts on a name plate basis making the aggregate capacity for the system 520,000 kilowatts.

These plants, by virtue of the substantial capacity of the transmission system that I have described, are operated and designed to be operated as a single interconnected system. That is, the spare capacity available in any one plant is

—653—

capacity available not only to that plant itself, but is capacity available to the entire system. 1130

In this way, the spare capacity required in the aggregate for the entire territory is reduced and distinct economies result from a closely interconnected system of this character, with transmission lines of adequate capacity to take care of the outage of the important units and important lines, thus operating as a closely connected system.

At the moment, because capacity at Avon and Ashtabula plants exceeds the needs in the portion of the territory served from step-down stations on the transmission line which, coupled with the fact that the economies at Ashtabula and Avon are better than the economies in the older Lake Shore plant, the usual operation is to transmit substantial amounts of energy north into Lake Shore plant, through the 66,000 volt underground system that I have described. 1131

When, however, these two units now being installed at Lake Shore plant are actually in operation, the picture is to be reversed and the transfer of energy during normal operations is likely to be southward from Lake Shore plant, rather than northward into Lake Shore plant.

1132 *Elmer L. Lindseth—By Respondents—Direct*

The presence of a high capacity transmission system, interconnecting the power plants, makes possible these reversals of flow of energy for economy at times when an individual power plant, for example, may, by virtue of new capacity, be changed from a low capacity station, or low

—654—

economy station, to one of substantially higher economy.

Similarly, the capacity made available, in Lake Shore plant by virtue of these new plant additions, will be made
1133 available throughout the system from Avon to Ashtabula, again due to this very substantial transmission system.

For example, in 1926, the very year in which the Avon plant was being started, in December of that year, before operation was thoroughly shaken down, needle ice formed in the lake and plugged the screens through which all the water comes into the plant. The plant was shut down and rendered unavailable to the system. Because, however, of the substantial capacity of the transmission system, because of the availability of the generating capacity at Lake Shore plant able to be utilized throughout the system, no customer suffered
1134 an outage because the loss of capacity at Avon was made up immediately at Lake Shore. This was a case of shutdown of an entire station, the last time such a disaster has befallen our system. This was in 1926, and it occurred during the preliminary operating period at Avon plant.

Normally, this system is neither operated nor designed to enable all customers to be served in the event of the loss of an entire generating station. The possibility of the loss of an entire generating station is so remote, the record of performance is so good, that it is not good engineering and

—655—

1135

not good economy to provide adequate capacity to protect against the loss of an entire plant.

The usual provision on our system which has prevailed now for a number of years, as design criterion, is to be able to carry the peak load of the system with the two largest units, not in the same plant, out of commission, either because of emergency outage or routine maintenance outage.

Q. Are there other principles of design which have entered into the construction of this generating system? A. Yes. A system of this class must be designed from principles 1136 backed up by long range thinking. The necessary part of the design of a system serving a territory as industrialized as is this, is the requirement that capacity be planned well in advance of need. Delivery of equipment takes a rather long period. Construction necessary before any equipment can be installed in the way of marine facilities and foundation, railroad sidings and buildings, require rather substantial times; so that it is a fundamental principle in the design of this system that capacity requirements be anticipated far in advance of needs.

For example, the capacity is now already on order, con- 1137 struction is now under way, for a turbine to be installed, not only one in 1941, but a second one to be installed in 1942, to be available for load, roughly two years hence.

So it is a fundamental principle in the design of this

system that those needs be anticipated at least that far in advance and the capacity be so scheduled.

Further, it is necessary in the design and development of a system of this class, that the choice of steam cycles to

1138 be employed be consistent with the type of fuel available, the cost thereof, and the character of the load to be served.

In this area the average load factor at the generating plants is of the order of 50 per cent. In this area for a great many years there has been available coal at what would usually be regarded in the utility business as relatively low cost.

As a result of these two factors, relatively low cost of coal of quite good characteristics, and a load factor of 50
1139 per cent., it is the economical choice of steam pressures and temperatures,—and that choice is practically controlling in the operating expense determination of a generating plant—these factors have made it prudent for this system to design and build relatively low pressure, low temperature plants.

For example, the older Lake Shore plant operates at 250 pounds, 600 to 700 degrees steam temperature. The Avon and Ashtabula plants operate at 375 pounds, 725 degrees steam temperature.

Because of changed conditions, however, partly in the location at which the new capacity is to be installed at Lake
1140 Shore plant in the center of a high load density district,

and partly because the two machines to be installed there are to, for many years, be the best two machines in that load area, the temperature and pressure chosen for the plant addition at Lake Shore, the 1941 extension, is to be 850 steam —850 pounds steam pressure—900 degrees. This choice of temperatures and pressures will make these two units quite the most economical units on the system in the generation of power.

A further principle as to which I have already referred in part, in the location of power plants, is that one having to do with the availability of coal, the proximity to railroads, and the adequacy of cooling water. But further than this principle, since the transmission line joining power plants is a very major element of a system, the choice of a power plant site must be carefully made from the point of view of the availability of transmission line right of way and access to the plant by these high lines.

For that reason plants, the output of which is to be trans- 1142
mitted over high tension transmission lines, are no longer able to be located inside of cities, for example, because of the lack of availability of overhead transmission line right of way.

Further, in the building of this system, the size of units chosen may be said to be moderate. The system now comprises 520,000 kilowatts of installed name plate capacity,

—658—

the largest unit of which is 50,000 kilowatts, or about 10 per cent. of the size of the system.

The two new units being installed are each 60,000 kilo- 1143
watts, and at the completion of the installation of the second one, the system capacity will be 640,000 kilowatts, on which the largest unit will be 60,000 kilowatts, again about 10 per cent. of the aggregate capacity of all power plants.

This principle has for some time controlled in the choice of the size of units, in the Cleveland system.

This choice of units, or unit size, provides a reasonable balance between fixed charges and operating costs, and at the same time reduces to what are regarded as reasonable limits, the amount of spare capacity required to be installed

1144 *Elmer L. Lindseth—By Respondents—Direct*

or operated on the system as protection against the loss of the largest one or largest two units.

Plant auxiliaries on the system, in the newer plants, are largely electrically driven. In the older plants, they are, in varying amounts, steam and electric driven.

For example, in Lake Shore plant to which there is now being added additions, in the older portion all the boiler feed pumps are steam driven. In the newer portions, however, while there will be installed for each turbine a steam
1145 drive boiler feed pump, this steam drive unit will be used only in the event of major emergency, since there are being installed also for each turbine three electric drive pumps, two of which are adequate to carry full capacity of the

—659—

machines, and the third electric drive being spare to be used in the event of emergency or routine maintenance.

This steam drive pump, as a matter of fact, is expected to be used so little, that the exhaust from that pump is to the atmosphere and is to neither a condenser nor to a heater.

1146 From the electrical point of view, the part the auxiliaries play becomes very important, because the operation of a turbine is not possible without the operation of all of the auxiliary pumps, fans, and other auxiliary equipment made a part of that unit.

As a result, in the design of the auxiliary supply to a station of this class, there is usually available to any auxiliary not only a normal supply of electric energy, but in the event of failure of that normal supply, an automatic provision to throw over the supply to an adjoining panel or feeder. Thus, in the event of loss of a normal supply,

it will still permit the operation of the unit without shutdown.

Further, in the design of this system, switchhouses have been designed as practically integral parts of the plants themselves.

At Avon and Ashtabula, the switchhouses are located within the same building as that which houses the boilers and turbines. At Lake Shore plant there is a separate switchhouse.

—660— 1148

Associated with plants of this class, where the load is supplied primary through a high tension transmission system, there are step-up stations, outdoor switching, transformer yards, and the associated equipment made necessary by supply to a high tension transmission system.

In the electrical design of these switch houses and main circuits, at plants like Avon and Ashtabula, to insure reliability and minimum disturbance to failure of equipment, there is vertical isolation of phases. Further than this, there is substantial protection horizontally, both between adjoining units and between phases of the same units and substan- 1149
tial isolation between different pieces of equipment serving the same unit, such as, for example, an oil switch and its associated disconnecting switch.

Isolation, then, of electrical equipment, is fundamental in the design of these plants.

Similarly in the matter of duplication of bus facilities so that in the event of failure of a single bus, a duplicate bus may be immediately pressed into service to reduce the duration of the outage caused by the necessary maintenance.

1150 *Elmer L. Lindseth—By Respondents—Direct*

Safe standards, of course, are used throughout. By "safe standards" I refer not only to safe standards for the protection of equipment, but safe standards for the protection of employees, and where the public is likely to be in hazard, safe construction from the point of view of the public.

—661—

In recent plants at Avon and Ashtabula, for example, in their entirety, and Avon is 14 years old, the most modern available equipment for the reduction of atmospheric pollu-
1151 tion is employed. These plants, both of them, are pulverized coal fired, and in their construction all reasonable precautions have been taken to insure reduction to a reasonable minimum of the discharge of objectionable dust to the atmosphere.

—662—

Smoke is no longer a problem in the operation of power plants. Economies of generation are such that smoke is only, under most unusual conditions, present at all.

Q. Do you generate any direct current at all at the three
1152 principal stations? A. Direct current is generated at each of these three stations only as incidental to the generation of alternating current. The control circuits in these plants are all direct current operated. Certain of the auxiliaries, notably those requiring variable speed motors, are direct current operated. Emergency lighting is direct current operated from a battery system. So that, in each of these three main generating plants there is capacity available for direct current generation, but none leaves the generating plant itself.

In the oldest of these plants, the steam heating plant to which I have referred as Canal Road Station, there is a single direct current 3,750 kilowatt machine, which is now operated incidental to the steam heating system, and sends its energy out to the direct current downtown system.

Q. At what frequency is alternating current generated? A. This system throughout is and has been, since its inception, operated at 60 cycles, 3-phase. The generation at Lake Shore plant is at 11,000 volts; generation at Ayon and Ashtabula plants is at 13,000 volts. All the plants burn coal as 1154 fuel.

—663—

Ohio and Western Pennsylvania are important coal-producing centers, and no fuel is competitive for steam generation in the Cleveland area with coal.

At all three of these plants, the coal is burned in pulverized form; at Avon and Ashtabula, exclusively so; but at Lake Shore plant only in part, as such.

There are also installed at the Lake Shore plant stoker-fired boilers in which the coal is burned in solid form on 1155 stokers, the number of which is 32. Turbines are, in all cases, horizontal turbines; with two exceptions all are straight impulse turbines, 17-stage, by-pass governed, running at 1,800 r. p. m.

Boilers in all classes are of bent tube construction, Stirling boilers.

The pulverized coal burning equipment at these three stations is essentially similar at all locations. The central storage system is employed in which the coal is pulverized in a portion of the main plant, transported to bunkers, from

1156

which it is fed to the boilers at a rate which is wholly independent of the rate at which it is pulverized.

At all three plants, refractory furnaces are used, with air-cooled walls. The boilers in all cases have capacities from 300,00 pounds per hour to 400,000 pounds per hour.

These generating plant facilities, as I have described them, are wholly adequate for present loads, and in no case

—664—

is there any deficiency of boiler capacity below the installed
1157 turbine capacity in the plant, and as I have testified, the present installed capacity is adequate for a load of 500,000 kilowatts, contrasted with which the maximum thus far experienced has been 436,000 kilowatts.

Q. How is that load distributed on the line? A. At the time of its generation?

Q. Yes. A. Well, I don't have data available on the actual generation which took place at each of the plants at the time the peak load was being carried.

Q. At all events, it was distributed among the—— A. (Interposing) But the capacity which was on the line at
1158 the time of this load was distributed in a manner for which I do have the data.

At the time the capacity at the Ashtabula plant was 190,000 kilowatts; the capacity of the Avon plant was 160,000 kilowatts; and the capacity at the Lake Shore plant was 165,000 kilowatts. These aggregate 515,000 kilowatts of capacity, which were on the line at the time that the load was 436,000. The subtraction yields a spare capacity at the time on the line of 79,000 kilowatts. That is, at the time of that peak, the capacity was adequate to handle 79,000

1159

kilowatts more load than was actually experienced, or, 79,000 kilowatts of the capacity on the line could be lost from service without impairing the ability to carry the peak load.

—665—

The generation is likely to have been approximately in the ratio of the capacities on the line, about one-third at each of the three generating plants.

Similarly, however, the loads distributed from Lake Shore plant was probably substantially in excess of the load generated at the Lake Shore plant, and energy being generated at 1160
Avon and Ashtabula was, without question, coming in over the transmission line, being fed into Lake Shore power plant, from which it was sent out over the sub-transmission system to distribution sub-stations.

The allocation of load between generating plants is a problem of considerable magnitude and is, in large measure, controlling in the resulting economies realized in the generation of power, and I should like at a later time to go into, in some detail, the principles employed in the allocation of energy between generating plants to carry a given load or a peak load. 1161

Q. Is your present capacity adequate to take care of the normal load growth during the next year? A. Well, normal load growth in the next year or two is a very difficult thing to forecast, with defense activities being what they are. As a result of engineering studies which have been made by the engineers of our Company, it has been decided that it will be economical and prudent to increase our capacity by 60,000 kilowatts in 1941, and by 60,000 kilowatts in

—666—

1942, even though the presently installed capacity appears adequate, in the face of normal load increase, to carry the

1941 load. There are many factors which contribute to engineering decisions of this character, the availability of equipment, the availability of capital, the potential economies which may be realized from high efficiency equipment installed even in advance of its need for carrying load; and it may be said that although the existing equipment is adequate to carry those loads reasonably to be expected, even in the fall of 1941, that capacity is being installed in excess of that estimated by the Company.

1163 Q. Will you refer now to Exhibit No. 21, and describe the transmission lines connecting the generating stations, to which you have already referred? A. I have referred a number of times to the essential importance of this transmission system, interconnecting these power plants, not only from the point of view of availability of power supply to all portions of the system, but similarly, for economy of operation and economy of fixed capital investment.

This line throughout, from Ashtabula to Avon, is steel tower, double-circuit construction, with two such steel tower lines paralleling each other on a single right-of-way, joining

1164 Avon and Ashtabula with four circuits.

Q. That gives you a total of two circuits? A. Two cir-

cuits on each tower line, two such tower lines, making a total of four circuits joining the plants.

Q. All right. A. In this transmission system are located six bulk power supply centers or transformer step-down stations, from which sub-transmission carries the energy from the inter-connected power system to the sub-stations. This 132,000-volt system comprises slightly over 450 circuit miles of this line and makes a type of system in which Cleveland,

1165

the high density load area, is circumscribed by a ring from which there is fed radially inward, at six points now, and soon to be seven, the main supply of energy.

Years ago, when systems were small, and specifically in Cleveland when the system was substantially the Lake Shore power plant, the supply of energy was radially outward from one power plant. Today it is radially inward from a closely interconnected ring into which the energy is fed, and from which the energy is carried into the load centers through radially inward lines.

1166

From this point in the lower left center portion of the map, designated as PV, known as Pleasant Valley sub-station or switching station of the Company, two lines, each of double-circuit steel tower construction, are built Northward into the Cleveland area. One terminates in the transmission sub-station indicated as GT and known as Grant; and the second one adjacent to it, Oak Street.

—668—

Q. What is the voltage of those two lines? A. Those lines likewise are 132,000 kilowatts.

1167

Q. 132,000 volts, you mean? A. Excuse me, yes, 132,000 volts.

The construction of the line from Grant sub-station North to Newburgh is 66,000 volt, 3-conductor, oil filled cable, the first of its kind used in this country.

The lines from Newburgh North into Lake Shore are double-circuit, 66,000 volt construction, single-conductor, 500,000 circular mil, compound filled cable, which, when they were installed in 1924, were likewise the first of their type

used in this country for transmission of energy in any substantial amount.

From this point, designated as Pleasant Valley switching station, the line which goes Southward to the edge of the Company's territory, is a single-circuit, steel tower line to the Ohio Edison Company, through their South Akron substation, forming an interconnection between the Company and the Ohio Edison Company.

Similarly, to the West, at the point designated LR, and
1169 known as Lorain switching station, a line extends to the Westward, to South Lorain, and is an interconnection, now unused, with the Ohio Public Service Company.

Q. And what is the voltage of that line? A. Each of these lines is 132,000 volts, single-circuit, steel tower construction.

—669—

From the point designated FW, and known as Fowles switching station, on the line between Avon and Pleasant Valley, there extend Northerly, into the West side of Cleveland, a double tower line with four circuits of similar 132,000
1170 volt construction.

Proceeding then to the extreme East end of the system, and Southwest of Ashtabula, the point designated SN on the map and known as Sanborn switching station, or better as Sanborn transmission step-down station, there is transformer capacity installed to supply sub-transmission at 33,000 volts.

The next point at which energy is taken off the transmission system is down in the Southeast portion of the territory at a point designated NF at about the lower edge of the Company's territory, and in the center of the map, and known

as Northfield transmission step-down station, and where, similar to Sanborn, energy is transformed from 132,000 volts to 33,000 volts for the supply of a sub-transmission system to feed distribution sub-stations.

It will be noted that with the exception of the station designated Clinton in the City of Cleveland, in the West side, all of these transmission line transformer step-down stations may be fed from either of two directions. For example, the sub-station designated Northfield, in about the center of the transmission system—— 1172

Q. (Interposing) Excuse me, in referring to these sub-

—670—

stations, would you mind referring to them by the letter designation? A. Yes, excuse me. This station to which I have referred as Northfield bears the symbol "NF", and it may be seen that that sub-station may be supplied with energy either from the West or from the East. Similarly, Sanborn, on the main ring, may likewise receive energy from either of two directions.

Q. And the letter designation of that sub-station? A. Is SN. 1173

Likewise, Grant, designated as GT, Oak Street, designated as KO, and Newburgh, designated as NB, may be energized from either direction.

Capacity is not, in all cases, adequate so that the complete loss of a transmission line on one side of a sub-station will still permit the complete operation of that sub-station, but energy can be, in part at least, supplied to that sub-station from these two directions.

The design of this system throughout is such that full capacity can be carried with the outage of one of the existing

1174 circuits. That is, the full output of Ashtabula plant may be transmitted Westward on the system, with but three of the existing four lines in service.

Similarly, from Avon plant Eastward, the full capacity of the plant may be carried with a single line out for either routine maintenance or emergency outage.

—671—

Q. You have explained the heavy black line which, in effect, encircles a major portion of the territory, and that is
1175 the 132,000-volt line. There appear at a number of points black lines slightly less in width. Will you explain the significance of those lines; in other words, for example, the line running from Avon, lettered AV, on the Western extremity, to the sub-station lettered KB. At what voltage is that line? A. That line shown as a solid line of intermediate weight, is a 33,000-volt overhead construction line. The line of similar weight which runs Northward from Northfield station, designated NF in the center of the ring, shown as a dotted line, is a corresponding voltage line of underground construction. These are part of the sub-transmission
1176 system rather than the main transmission system, the distinction being that the sub-transmission system conveys energy from this main backbone system to the distribution substations.

This ring which I have referred to as result of this evolution from a single plant system from which the feed is radially outward, to a multiple plant system from which the feed is radially inward, is result of some 30 years or more of growth, 35 years of growth, in the transmission and sub-transmission of the system.

The first plant of the company, Canal Road plant, served all of its customers directly from the power plant. There were no sub-stations, there was no transmission, there was no sub-transmission. This situation prevailed in Cleveland

—672—

until 1905, when the first sub-station was built at a point substantially removed from the power plant, some 5 miles, and to which energy was transmitted with 11,00-volt underground cables, and from which, then, the distribution lines radiated. 1178

This marked the beginning of transmission on the system. The development from then on was rather rapid. The number of customers and the amount of load acquired grew very quickly, and in 1911 the Lake Shore plant was built, from which the sub-transmission of energy was again radially from the power plant. There is associated with the electro-generating plant a switch house with a substantial number of 11,000-volt circuits in it, more than 120, and during that period of growth of the Lake Shore plant, from 1911 to 1924, all of the system load was able to be handled by the addition of more and more 11,000-volt cables, feeding radially 1179 out of the power plant.

Then came the transition from a radial system to a ring system, and in 1923 a contract was entered into with the Ohio Edison Company for the sale of a substantial block of energy, 15,000 kilowatts, at the Cuyahoga County line, at the terminus of the line which we have designated from Pleasant Valley, indicated as PV, and going Southward.

To supply this load, there was then developed, first, the 66,000-volt underground system from Lake Shore through Newburgh, with the symbol NB, to Oak Street, symbol KO,

and thence Southward to Pleasant Valley and Akron, and

—673—

because, for engineering reasons, transformers of this character, namely, from 66,000 to 132,000 volts, required tertiary windings, this tertiary voltage in that initial transformation was chosen at 11,000 volts, and additional sub-stations were and still are supplied from Oak Street transformer step-down station.

In this evolution period from 11,000 volts to 132,000 volts,
1181 there were intermediate periods where lines were operated at 22,000 volts, and in 1924, at about the time when the first 132,000-volt construction was being made, there were then existent 50 miles of 22,000-volt line supplying four sub-stations.

With the increase in load, however, and because of the inadequacy of 22,000 volts to carry the necessary loads, this standard was abandoned and sub-transmission is now at but two standard voltages, 11,000 volts and 33,000 volts, and today, this 33,000-volt system now embraces more than 300 circuit miles of pole line.

1182 Shortly after the construction of this line Southward from the Lake Shore plant to the interconnection with Akron, a contract was likewise entered into with the Ohio Public Service Company, to the West, and the 132,000-volt system was extended Westward to the point designated as Lorain switching station, symbol LR, and the tap Westward. Actually, the Lorain switching station was not built until shortly after, when the Ayon plant was built, but the line was definitely constructed.

—674—

By Mr. Hamilton:

Q. You have testified that that line is no longer in use at this time? A. Yes, as I have mentioned, this interconnection is available for use but is at the moment unused. The reconnection of the line would require about twenty minutes of work.

All of this system is designed for independent operation of the circuits. That is, these circuits are not parallel on the high voltage side, but rather are parallel on the low voltage side. As a result, a short circuit in the 132 kv. 1184
system results in a much reduced fault current, due to the fact that series impedance of the step-up transformers, themselves, is interposed between the point at which the fault occurs and the point of supply, whether it be power plant or additional supply from the 132 kv. system.

Construction is all of 4/0 copper. The ground wires, which are used on all steel tower circuits, are one-half inch copper weld. Standard span lengths are seven hundred feet between towers. Parallel tower lines on single right of way are spaced at a minimum distance of sixty feet to protect 1185
against flash-over in the event of serious side sway of conductors due to high wind or other disturbance.

The system is designed and the conductors are so drawn up that the design tension of 4,500 pounds per square inch will be realized when the conductors are loaded with a half

inch of ice at zero degrees Fahrenheit with the wind intensity such that the loading is eight pounds.

Under these conditions, the factor of safety of the conductors, themselves, is two. The ground wires are similarly

sagged, but because of the superior strength of the wires, the corresponding factor of safety under similar loading conditions is of the order of four. Insulation throughout with normal suspension strings is ten insulators, ten inch discs on five inch centers, and on strain towers the number of insulators is twelve instead of ten.

Q. What are "strain towers"? A. In the carrying of 132,000 volt circuits, if the towers be in a straight line, the load on the tower is only to hold the weight of the conductor
1187 up and the insulator is termed a suspension string. Its job is to hold the wire up. In the event that line, however, turns a corner, a strain—a sidewise strain is imposed on the tower and the insulators are then termed "strain strings" and are likely no longer to be only holding the conductor vertically upward, but are likely to be displaced at an angle from the tower so that the conductor will enter from one direction and leave at a second.

The insulator is termed a strain string and the tower is termed a strain tower. In accordance with administrative order No. 72 of the Public Utilities Commission of Ohio,
1188 —676—
the number of insulators is increased from ten to twelve. These 66,000 volt underground circuits carrying energy from this transmission system are run in separate subway from all other circuits and this subway carries no other circuits other than relay and control circuits additional to the main conductors.

The subway is buried at greater depth than the normal subway to minimize temperature variation in the ground and these circuits are either 500,000 circular mils solid cable,

the older design, or 400,000 circular mils three conductor oil filled cable of the new design.

The aggregate capacity of these transformer step-down stations is 470,000 k. v. a. at these six points I have described, as against the 520,000 kw. of generating plant capacity. This capacity of the transmission sub-stations, which I have given, is the normal self-cooled rating which is increased to 520,000 k. v. a. with airblast.

The smallest of these stations is Sanborn, with capacity 30,000 k. v. a. 1190

Q. Could you locate that on the map, please? A. Sanborn, again, at the easterly end of the system and designated as SN, serving a low-load density area; it is the smallest of transformer step-down stations. The largest of them is on the west side of Cleveland, known as Clinton Sub-Station and designated CL, just below the caption "Cleveland and

—677—

Suburbs." It has a capacity of 144,000 k. v. a., self-cooled, 192,000 k. v. a. with airblast. The average capacity is 80,000 k. v. a. and the number of circuit breakers required for this system is fifty-eight. 1191

Just as the power plants, themselves, are of adequate capacity for the handling of loads, now experienced or expected to be experienced, the capacity of the transmission system and the transformer step-down stations is, with a minor exception, likewise adequate for present loads. The single exception to which I have referred is that at Oak Step-Down Station with symbol KO in the center of the map, joining 132 kv. system with the 66 kv. system and which last year carried a maximum load in an amount equal to 115 per cent. of the nominal capacity of the equipment. This is,

1192 *Elmer L. Lindseth—By Respondents—Direct*

however, a temporary condition which will be relieved by the installation of the new units at Lake Shore Plant and must not be regarded as a condition which would be permitted to continue for any substantial period.

The average relationship between the maximum load experienced last year and the designed capacity is at Clinton sub-station, 65 per cent.; Grant, 75 per cent.; Newburgh, 70 per cent.; Northfield, 74 per cent.; and Sanborn, 70 per cent.

As I have mentioned, Oak Street, however, carried a load
1193 equal in amount to 115 per cent. of its nameplate capacity.

—678—

Q. How do you determine the adequacy of these stations for future load? A. The adequacy not only of a station but of a line of a transformer, of a subway, a power plant, is a matter of constant engineering check in order that requirements may be anticipated sufficiently far in advance of their being experienced, to afford opportunity to install the equipment in orderly fashion.

The engineering department keeps constant check on the loads carried in all portions of the system and curves are kept
1194 on which are indicated the actual loads being experienced and the maximum capacity of the particular facility, whether it be line or transformer or sub-station.

When it becomes apparent that the increased load will in reasonable time reach the capacity of the plant, then there is installed either additional capacity at that point to provide for the expected increased load or the load on the existing unit of equipment, line or plant is so reduced by transfer to another source that the equipment will not be overloaded at a point in the near future.

1195

This is a matter of continuous engineering check and is the only plan which makes possible the continued and orderly development of a system without developing serious overloads and inadequacies.

Further than this, it became apparent, because of the

—679—

rapid industrial growth in the territory immediately to the east of Cleveland, and which I mentioned in some detail this morning in describing the territory, that the present transmission facilities to the portion of the map in the northeastern portion of Cleveland would, in the next few years, be inadequate.

1196

Therefore, there is in progress of engineering design now, a new transformer step-down sub-station to be located in the main transmission line between the village designated South Russell and Chardon, the transmission lines from which will run northwestward at 132,000 volts into Cleveland for the supply of this industrial area, and the relief of those lines now shown going northward from Northfield designated on the map as NF, and running up to the present East Cleveland Sub-Station designated EC.

1197

This line now expected to be built, is an outgrowth of long-range engineering study of the character to which I referred where it became apparent that in the next few years the capacity of existing facilities would be over-taxed.

Q. The proposed line, of course, is not shown on the map? A. The proposed line is not indicated on the map. The map indicates the facilities of the Company as of July 1, 1940.

The Examiner: Let us have a recess of five minutes.

1198 *Elmer L. Lindseth—By Respondents—Direct*

(Whereupon, a short recess was taken.)

—680—

By Mr. Hamilton:

Q. You referred to the 66 kv. underground system in Cleveland. Will you describe that system for us? A. The development of this system was a significant contribution to the art by the Company in 1923 and '24, when the installations were made.

Prior to that time there had been some 33,000 volt, three
1199 conductor cables in operation in some of the larger systems of the country but operating difficulties had made it necessary to reduce their operating voltage to 27,000 volts.

It was decided that since the amount of energy to be transmitted was rather substantial and the distance rather great, that higher voltage would definitely be required, and 66,000 volts was chosen; but because of the newness of the design, the joints to connect the cable having theretofore not been developed were required to be developed by the Company.

Later, in 1937, when the capacity of this system was
1200 added to, 66,000 volts was again chosen, but three-conductor oil-filled cable was used and there again, although cable of that voltage and type had previously been used in short unjoined lengths, the cable joint required to be used had not theretofore been in common usage, so that this section of transmission line was largely developed by cooperation between engineers of the Company and those of the manufacturer.

—681—

This, I think, substantially describes that transmission system.

Q. You have no 132,000 volt transmission lines in the City proper? A. There are no 132,000 volt transmission lines in the City of Cleveland either overhead or underground.

Q. Will you now describe the sub-transmission system of the Company? A. The third step in the transmission of energy between the power plants and the consumer is the sub-transmission system carrying energy from the main transmission system to the distribution sub-stations.

This sub-transmission system, in the case of the Cleveland Electric Illuminating Company, comprises 485 miles of 1202
11,000 volt cable, 76 miles of 33,000 volt cable, and 378 circuit miles of 33,000 volt overhead lines.

In general, underground construction is confined to urban densely populated areas, overhead construction is possible in less densely populated and rural areas, and in certain cases, over private right of way, in rather densely built-up areas.

This sub-transmission system is a substantial portion of the company's property and aggregates in first cost $19,000,000.

Referring again to the map, the portion of the system designated as "Cleveland and Cuyahoga County", in general 1203

is the area in which 11,000 volts sub-transmission is employed. In this area are five points at which energy leaves the main generating and transmission system and these are—referring to the center of the map—Lake Shore Plant, symbol LS; south the Newburgh transformer station, symbol NB; Oak Street Sub-Station, symbol KO; to the left the Grant Sub-Station, symbol GT; and Clinton, symbol CL.

From these twenty-two distribution sub-stations in Cleveland and the immediate vicinity are served by 142 under-

ground circuits of two types or sizes; namely, 4/0 and 600,000 circular mils.

Since the voltage adopted in 1905 is still the standard sub-transmission voltage in the City of Cleveland, subway and cable which might otherwise have been rendered no longer useful by the transition in system design from the radial outward system to the ring system, feeding radially inward may be used. There have been substantial economies in re-using the cable rendered just temporarily idle
1205 by the change.

The supply from Grant Step-Down Station, symbol GT, is primarily to only two customers, both of them steel mills, the American Steel & Wire Company and the Republic Steel Company, to whom energy is supplied directly at 11,000 volts. From the transmission sub-station designated as Northfield, symbol NF, there are supplied five sub-stations through underground cables at 33,000 volts.

—683—

These are the sub-stations in Cleveland and its immediate environs. Thirty other sub-stations are fed by overhead
1206 sub-transmission circuits at 33,000 volts, twenty-four of them in the three counties to the east of Cleveland, and six of them in the portion of the system to the west and southwest of the City of Cleveland.

Three of these sub-stations are fed directly from Avon Plant from the line to which I referred running through Lake Sub-station, symbol LK; through Bradley, symbol BR; and Knickerbocker, symbol KB, along the shore of Lake Erie.

Again, reliability has been a controlling factor in the design of this sub-transmission system and although it is obvious that the reliability of service in an area with overhead sub-transmission can not be as great as in areas served

from underground construction, still the density of load and the requirements of service are such as to make it entirely feasible, and the resulting service entirely adequate in those areas served from 33,000 volt overhead construction. All sub-stations which are served from underground cables are able to maintain their peak load even after the outage of one circuit in the supply system.

In most cases, overhead spare capacity is likewise provided in the supply of sub-stations at 33,000 volts overhead and again the loss of one circuit does not result in outage 1208
of the sub-station, and just as the main transmission system

—684—

was closely interconnected for operation, as a single unified system, so the sub-transmission system is similarly closely interconnected for operation as a single unified system.

In general, these sub-transmission feeders supplying a given sub-station are operated in parallel, both at the sending and the receiving points. To protect the sub-station supply, however, these feeders are usually connected to different buses or bus sections at the sending end and to sectionalized bus at the receiving end. 1209

Cable loading is conservative. These 4/0 cables at 11,000 volts, which predominate in the Cleveland area, are loaded to 160 amperes in summer time, 175 amperes in the winter time. 600,000 circular mils cables are similarly loaded to 300 and 325 amperes. This conservative loading makes for safe operation and insures long life under normal operation.

Under emergency conditions, these normal ratings provide a rather adequate reserve capacity and ability to carry a normal load without failure or severe damage. The load

that a cable circuit may carry is in general limited by the temperature to which the conductors will rise, and in areas of extreme concentration of subway and cables, artificial means are sometimes required to cool the cables and the surrounding subway and ground through which the cables run.

—685—

1211 In the proximity of the Lake Shore Plant, as shown in Cleveland and designated by the symbol LS, there are, in a rather concentrated area, 79 sub-transmission feeders running quite close to each other. The amount of heat evolved is substantial and to meet this condition a ventilating system is installed in the subway comprising seven exhaust fans.

Running north from Northfield Sub-Station, designated as NF on the map, to which I have referred as the 33,000 volt underground system, there is 76 miles of three conductor 350,000 circular mil, paper insulated, lead covered cable, rated 37,000 volts, for sub-station supply, and in addition, twelve miles of similar cable for industrial plant supply.

1212 The 33,000 volt overhead system, which I have described, comprises 251 miles of pole line made up just about one-half of single circuit line and one-half of two circuit line. Because we haven't specifically located that, we might trace its path, in order to reveal the extent to which the territory is covered, and commencing with Sanborn Sub-Station, designated as SN, in the main transmission system, just below Ashtabula, there is seen to be a line running almost due east joining a line running north and south from Pierpont Sub-Station designated as PR, vertically north into Conneaut.

This line then comes back westward, parallel with the shore of the lake through Kingsville Sub-Station designated KV, and then circles around the outer and lower limits of Ashtabula, through sub-station SB, known as Saybrook, through

—686—

Geneva, through the town of Madison, supplying Eagle Sub-station designated EG, westward to Painesville, supplying Erie Sub-Station designated ER, and from which there is a tap north to Fairport and supplying Fairport Sub-Station designated FP, continuing southwesterly to Mentor, supply- 1214
ing Mentor Sub-Station designated MT, thence in the same direction to Willoughby, supplying sub-station Glenn and designated GL and into East Cleveland, symbol EC.

This loop then moves out from East Cleveland in a southeasterly direction to a sub-station designated MW and known as Maywood, and for that short distance from East Cleveland to Maywood, the circuit is at 11,000 volts.

Q. Underground? A. Underground. At Maywood—excuse me. In the short portion indicated, there is a solid line just to the West of Maywood—that 11,000 volt circuit does become 1215
11,000 volts overhead construction. The 33,000 volt system then proceeds due east through Gatesmills Sub-Station, designated GM, south of Chardon to Orwell and up to Rock Creek and Jefferson and back into Sanborn with taps southward to supply Burton and Middlefield, and at about South Russell a line is seen to run south to a sub-station designated AB and known as Auburn.

In the southwest part of the system supplied from Clinton Step-Down Station, designated as CL and located just under the caption "Cleveland and Suburbs", a similar 33,000 volt

—687—

1216 *Elmer L. Lindseth—By Respondents—Direct*

line supplies three sub-stations designated RD and known as Ridge, supplying Bagley, with symbol BL, and a third one southeast from Bagley designated RL and known as Royalton.

This, then, is the 33,000 volt sub-transmission system and is seen to be closely interconnected and complete in its coverage of the entire territory.

The system is now quite adequate for loads presently imposed on it as is in fact all of the sub-transmission system. The general principle employed for the checking of capacity
1217 which I described in connection with the main transmission system is similarly used in the case of the sub-transmission system and as of 1939, even heavily loaded sub-stations were in no case loaded above their nominal design rating at maximum load.

Sub-stations of the class of Lakewood, which is a 1925 design and has a nominal capacity of cables feeding it of 28,800, in nine 11,000 volt circuits, which I have described, was loaded at peak to 92 per cent. of the capacity of these cables and, of a substantial number of sub-stations which I have on the table, Lakewood is the highest loaded of the
1218 group.

The 33,000 volt cables from Northfield are of such capacity that the entire load may be carried with one cable out of service, and three of these cables are tapped for the supply of other sub-stations en route. The aggregate loads on the five cables undiversified, is, as of 1939, about 63,000 kilo-

—688—

watts, which loading is about 86 per cent. of the five cable groups' normal capacity.

This 33,000 volt ring sub-transmission system, which I described in the eastern portion of the company's system, is

usually not operated as a closed ring, but is sectionalized and energized from either half. That is, energy is supplied to the eastern portion of the ring through Sanborn Sub-Station and energy is supplied to the western portion of the ring through East Cleveland and Northfield Sub-Stations.

The total circuit capacity from Sanborn alone is of the order of 60,000 k. v. a., which, when increased by the capacity of the Bedford and the East Cleveland lines, becomes more than 80,000 k. v. a., and the aggregate load from this system is of the order of 30,000 k. v. a. 1220

The sub-transmission system is likewise being added to in the plans for the near future. One sub-station was installed just in the early part of this year and is adjacent to downtown Cleveland—Payne Sub-Station—and designated symbol PA on the map, for the carrying of alternating current load in the downtown district normally supplied by direct current. This sub-station will relieve two others and required additions in sub-transmission. Additional sub-transmission facilities are being provided for Willson Sub-Station, Doan, Lakewood, and Warner.

—689— 1221

The purpose of this sub-transmission system as described is to convey the energy from the main transmission system to the distribution sub-stations. These are fifty-seven in number, fifty-three of them being alternating current sub-stations and four of them direct current sub-stations.

The aggregate capacity of these is 520,000 kilowatts. The range is in size is from 30,000 down to 300 kilowatts, and the aggregate investment represented is in excess of ten million dollars.

1222 *Elmer L. Lindseth—By Respondents—Direct*

Q. In the sub-stations, themselves, is that right? A. The investment of ten million dollars represents investment in land and structures and in equipment. As was common practice in the days when the electric facilities were first being extended downtown Cleveland, direct current was used. This system has continued and is still an important part of the downtown electric facilities in Cleveland.

Over an area of about one and a quarter square miles, service is primarily direct current supplied through four
1223 sub-stations, which are in the center of the City of Cleveland, immediately below the designation Lake Shore and are shown by the symbols PS for Public Square and CN for Canal, BV for Bolivar, and DG for Dodge.

The A. C. or alternating current distribution sub-station systems range from Conneaut, supplied through an alternating current sub-station known as Jackson and designated JS

—690—

on the map, to the extreme western portion of the system to Lake Sub-Station designated LK, adjacent to the Avon Plant. The distance between these two points is somewhat over
1224 ninety miles.

One-half of the alternating current distribution sub-stations are located within the area comprising Greater Cleveland. The others are widely scattered and are largely covered in the testimony in connection with the circuit followed by the 33 kv. sub-transmission system which I have described.

Of these distribution sub-stations, a wide variety of types is required, since some of them are primarily residential, others are primarily industrial, some house street-lighting equipment, some serve customers at sub-transmission voltage,

1225

some serve street railway sub-stations, some are at 33,000 volts, some are at 11,000 volts.

Supply to distribution sub-stations is in all cases received through the sub-transmission system at either 11,000 or 33,000 volts. Of the fifty-three alternating current sub-stations, eighteen receive their supply at 11,000 volts, one is supplied at 13,000—and that by the way is an exception to a previous statement that I made—and thirty-five receive their supply at 33,000 volts from the transmission step-down stations.

1226

This wide variety in service conditions is a condition prevailing as of the present, but in the course of the thirty-

--691—

five years during which distribution sub-stations have been employed, there have been, of course, substantial developments in type and design so that the types of sub-stations represented are six and these range from attended sub-stations where men are in attendance, either one or two persons per shift throughout twenty-four hours of the day, to completely automatic sub-stations in residential and outlying areas, where no persons are required in attendance, but where inspectors get the necessary data and make inspections of equipment on routine visits.

1227

These alternating current distribution sub-stations are within the types standardized in design and arranged to permit feeders of a given type or class to be interconnected for reliability between adjoining sub-stations. That is, just as the main and sub-transmission systems were designed and are operated as a single interconnected system, so the distribution sub-stations are so located, are so designed and so

operated, as to realize the maximum benefits from this close interconnection.

As a matter of fact, in the event of outage of a feeder supplied from a given sub-station, in many cases emergency supply for that feeder may be obtained from an adjoining sub-station through a cross-tie or an emergency tie. This is only possible when the system has been carefully designed for interconnected operations as a single unified whole.

—692—

1229 Again, as was the case in the main transmission system and the sub-transmission system, the capacities of distribution sub-stations are adequate for loads now experienced or those immediately in prospect.

To the extent that capacity additions are suggested by the engineering studies from which are projected expected future loads in the next year or two, when such additions are suggested, they are built well in advance of need. Sub-stations are not inherently limited as to capacity, but from practical reasons are usually limited in size, and it is the policy of the Company to provide relief for sub-stations be-

1230 fore they actually reach their full load capacity.

In every sub-station there are switchboard panels provided for increase in service. Sub-stations are usually built in sections and nine of the existing distribution sub-stations have been built to two sections, two have a single section—and I am referring now to the attended type of sub-stations of which there are eleven in toto, and, while it is not advisable or may not prove advisable to extend these to three sections in all cases, there is land duct space and provision in the design for such an extension.

1231

The sub-stations distribute energy to the consumers at three voltages: 2,300 volts, 4,600 volts, and 11,000 volts, and although certain customers are served at 33,000 volts, in general they are served from the sub-transmission system.

—693—

This then concludes the discussion of the sub-station system.

Q. When you say that the customer takes current at these three voltages, you don't mean that it actually goes into the customer's premises at those voltages, except, perhaps, in the case of industrial? Isn't it actually stepped down to a lower voltage before it goes into a residential consumer's premises? A. That is definitely true in the case of residential and the smaller commercial customers. Of the 330,000 customers served, the number who would receive energy at a voltage as high as 2,300, woud be definitely less than 2,000 or of the order of one-half of one per cent. of the customers.

1232

Q. So that, after the energy leaves the distribution sub-station and before it gets into the customer's premises, the voltage is further reduced? A. That is correct. It is these facilities between the distribution sub-station and the consumer, himself, which are described as the distribution system. The distribution system represents a rather substantial investment, $57,000,000 of property in the service of these 330,000 customers.

1233

Of the 330,000 customers, about 1,750 are supplied with direct current, the rest with alternating current. The alternating current is in all cases sixty cycles. It is supplied from primary feeders which are in all cases three-wire pri-

—694—

1234 mary, three phase current, although in the case of the vast majority of customers, the service is single phase. The distribution for direct current customers is substantially all underground construction, a three-wire Edison network with voltage standards 115 to 230 volts, and the number of such feeder circuits is 216.

Also supplied from this distribution sub-station system are more than 20,000 street lights, which are served either from series circuits which feed out of the distribution sub-
1235 station or from circuits supplied from pole type regulators.

The alternating current system for consumers at 2,300 and 4,600 volts comprises two classes of feeders: Light feeders and power feeders. Lighting feeders, in general, as the name suggests, are for lighting load and small motor loads. Lighting feeders are, in all cases, regulated. That is, the voltage control is rather close.

Power feeders, as the name suggests are generally designed for carrying of power loads, voltage control is not so precise, although many are regulated.

In industrial and urban areas, when lack of regulation
1236 of power feeders might result in voltage deviations more than plus or minus five per cent. from normal, these feeders are equipped with voltage regulators of the three-phase type. The regulation of voltage on the lighting circuits is designed to be maintained to within plus or minus 3 per cent. at the

—695—

customers services, and while these circuits are not entirely free of motor load, the motors are in general below five horsepower in size.

Continuity of service to consumers is an important aspect in the design and operation of a distribution system, and

since these lines from the distribution sub-stations to the consumer are exposed, are in most cases overhead and in territory such as that of the Cleveland Electric Illuminating Company, in areas where there are a substantial number of trees the vulnerability of the distribution system to service outage is greater than any other portion of the system.

Continuity of service is protected by the provision of numerous emergency tie-feeders which, in the event of loss of one feeder, or at least the supply to that feeder, permit of cross-connection or interconnection with emergency feeders 1238 from other areas, thus permitting restoration of service prior to the time that it might otherwise be restored were such an emergency feeder not available.

This system, then, too, is designed for operation as a single unified and interconnected whole, where a given area —a given customer, in fact—may be supplied at times from more than one sub-station.

As indicative of the substantial size and the far-flung character of this distribution system, the mileage of overhead wire in the distribution system exceeds 16,000 miles of

—696— 1239

line.

Q. Throughout the entire territory? A. Throughout the entire territory. This distribution system comprises then 115 volt, 230 volt cables, about 350 miles. In 2,300 and 4,600 volt cables, almost 700 miles. 11,000 volt cables to industrial plants, 180 miles. 11,000 volt cables to railway sub-stations, 63 miles, and 33 volt cables to industrial customers twelve miles.

The amount of underground subway required is 410 miles of multiple duct subway, and the equivalent single duct, or

1240 the length of tube in which the cable runs is 3,350 miles on the system.

The number of distribution transformers is 33,500. The number of poles, 192,000; the number of manholes in the underground system is about 9,000; and the number of electric services—the service is a facility between the distribution system and the consumer—is 233,000.

Again, the same system of constant check is employed by the engineering department to insure adequacy of facilities
1241 and adequacy of capacity in advance of load growth. Weekly maximum readings are kept of load on every feeder, every cable, every line. These are plotted and when the trend of these is such as to suggest in the near future or in the definite future, an inadequacy of capacity, design steps are taken to either relieve the particular facility of part of its load,

—697—

transfer its load, or else to increase the capacity of the facility by construction and design.

As evidence, however, of the extent to which these facil-
1242 ities were loaded last year, the average direct current network feeders were loaded to 74 per cent. of their capacity. The average alternating current lighting feeders, 2,300 and 4,600 volt lines were loaded to 76 per cent.; the power feeders of similar class loaded to 79 per cent.; the 11,000 volt industrial cables, 75 per cent.; the 33,000 volt industrial cables, 64 per cent.

In keeping with the requirements of the company that loads are adequately anticipated and construction undertaken in advance of actual need, two new outdoor sub-stations are now definitely being built or about to be put into

service. These are Park sub-station near Painesville, and Thompson sub-station south of Madison, and at two others, Payne sub-station and Heights Sub-station, facilities have just now been completed for increasing the service.

Q. The two sub-stations you referred to as being under construction are not shown on the map, Exhibit No. 21, is that right? A. That is right. No facilities not yet in service are indicated on the map.

In addition to these—or these additions, rather, will provide eight new 4,600 volt feeders and one additional 11,000 1244

—698—

volt industrial feeder is being installed.

A significant development in this system in particular was the very early choice—as early as 1898—to use the distribution voltage at 2,300 volts in three-phase, sixty-cycle, three-wire feeders. That standard, chosen more than forty years ago, is still used in a very substantial portion of the system and was at the time rather a farseeing design in engineering judgment.

That, I think, concludes the discussion of the distribution system. 1245

Q. Do you have other facilities in addition to those that you have already referred to which are devoted to your electric service? A. Yes. As I mentioned in the summary of the facilities which the Company employs, there are, in addition to the electrical facilities, the supplementary properties required to make the electric system work, and these embrace nine offices, a general or main office of the Company in the City of Cleveland, and eight additional offices, largely for the convenience of customers, and since the maintenance and construction of a system of this size requires a sub-

1246 *Elmer L. Lindseth—By Respondents—Direct*

stantial number of items of equipment, warehouses and storerooms are maintained at sixteen locations.

Since transportation is a vital element in restoring and rendering service and in construction, garages are maintained at ten locations, research and test laboratories for

—699—

coal, for materials, for water, for meters, and the many other items employed in the design and servicing of this system; such laboratories are seven in number, and these
1247 in general are of widely diversified types. Most of them are in quarters owned by the Company, but some have been located in leased quarters. Some have been built specifically for the use to which they are put; some are in factory type buildings converted and rebuilt—in general, have been purchased—and here, the warehouses, garages, shops and general offices are used substantially to the limit of their present capacity, but there the inconvenience is to the Company rather than to the consumer and in general such a situation is not so serious as a situation in which consumers' facilities are used to their maximum capacity.

1248 Q. Where is your main office located? A. The main office of the Company is located in the center of Cleveland at the Public Square, and is designated on the map, only as a coincidence, at the point bearing the symbol PS, which is a sub-station located in the basement of the general office building.

Then, to supplement these fixed properties, the Company maintains its own fleet of transportation and construction equipment which embraces 231 trucks, 111 trailers, numerous tractors, pole setting machines, cranes, trenchers, concrete

—700—

mixers, air compressors, pumps, and numerous other portable items of equipment, the aggregate value of which represents about a million and a half dollars.

The Company, in general, does its own construction work of lines, both transmission and distribution. The Company does its own construction in equipping sub-stations, as a result of which this rather substantial amount of portable construction equipment is required.

Q. You are not in the transportation business, however, are you? A. The Company is in the electric utility business 1250
and only to the extent that transportation equipment is required in the business does the Company own its own transportation equipment.

Q. So that when you refer to transportation equipment, you are referring to equipment devoted to electric service? A. That is right.

Mr. Hamilton: This again, Mr. Examiner, is a convenient breaking point.

The Examiner: All right, we will recess until 10:00 o'clock tomorrow morning.

1251

(Whereupon, at 4:30 o'clock p. m. the hearing was recessed until 10:00 o'clock a. m., August 6, 1940.)

1252 *Elmer L. Lindseth—By Respondents—Direct*

Whereupon, ELMER L. LINDSETH resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Lindseth, yesterday you described generally the properties owned by the Cleveland Electric Illuminating Company. I would like to have you now describe the manner in which those properties are operated. Would you therefore begin with a description of the method of opera-
1253 tion of your power plant system? A. In the operation of the system which I described yesterday, embracing the property included in the territory served by the Cleveland Electric Illuminating Company, a three-fold function is designed to be fulfilled; that is, the company seeks adequately to serve

—724—

the customers, it seeks to fulfill an obligation to its employees, and it seeks to meet its requirements to its stockholders.

In the fulfillment of this function of serving adequately its customers, it is necessary that service be reliable and con-
1254 tinuous, that the rate structuure affording this service to the consumers be at reasonably low cost, with safety adequately provided, and under conditions which foster increased use of electricity in the territory, and the promotion of industrial and commercial development.

In serving its employees, the functions of the company are to insure fair remuneration for the services those employees render, to insure them some reasonable stability of employment, opportunities for advancement, and the provision of safe and favorable working conditions with reasonable provision for retirement.

In the fulfillment of the third of these objectives, the obligation to the stockholders and equity owners of the business, there is the requirement that the investment made in the business be protected against loss, and that there be provided on that investment a reasonable rate of return.

In the operation of the power plants, the sources from which the energy ultimately distributed is obtained, the objectives are to provide at the source this required continuously available adequate source of energy.

—725— 1256

Q. Do you have any figures on the number of men employed in the operation of these power plants? A. For the operation of these three plants which comprise the power generation system of the company, there were employed as of 1939, 575 men of whom 497 were engaged in the operation of the so-called Steam Departments of the plant, those engaged in the generation of steam, and the operation of the turbines and other associated equipment. And there were 78 concerned with the operation of the Electrical Departments of the company.

These plants last year generated about 1,885 million kilo- 1257
watt hours of energy in accordance with the system plan of operation as a single unified system, and this energy was distributed among the several plants in amount of 43 per cent. at the Ashtabula plant, 31.9 per cent. at Avon plant, 24.6 per cent. at Lake Shore plant, and 0.5 per cent. at the Canal Road plant.

The annual system load factor on the peak experienced was 49.3 per cent., and the capacity use factor based on name plate capacities was 40.8 per cent. The resulting fuel economy expressed as B. t. u. per kilowatt hour was 14,707, and the fuel required was about 1,050,000 tons.

1258 *Elmer L. Lindseth—By Respondents—Direct*

Q. I believe you mentioned yesterday that your system load factor was 50 per cent. or thereabouts. The precise figure is 49.3 per cent. as you have just testified today?

—726—

A. The precise figure for 1939 was 49.3 per cent., and the connection in which the 50 per cent. was referred to was a long time picture as an average overall value as the criterion for system design.

Q. Is your 49.3 per cent. figure an average annual figure
1259 of 1939, or is that at a given time which you may specify?
A. Load factor by definition is the ratio between the actual kilowatt hours generated and the product of the peak load generated by the number of hours in the year. That is, it is the ratio between the actual generation and the generation which would have prevailed had the plant run at its top load throughout the entire year.

Mr. Binford: The period is a year?

The Witness: The period is a year.

The significance then is that the average load of the company bore a relationship to the maximum load
1260 which was 49.3 per cent. The peak load was not made within that definition but variously established. It might be a one-hour peak, it might be a half-hour peak, it might be a 15-minute or an instantaneous peak. In this case, it is the instantaneous peak carried during the year, so it is the load factor as related to instantaneous peak.

By Mr. Hamilton:

Q. What department is in charge of the operation of your power plant system? A. The operation of these power

—727—

plants is a combined function of the Steam Department and the Electrical Department with certain supplementary work under the direction of the general safety committee and the safety department of the company. The turbines and boilers of the entire system and their associated equipment in the way of auxiliaries are operated and maintained by the Steam Department under the centralized supervision of the superintendent of power, with an assistant and several associates who direct the supervision of all power plants from the general office in Cleveland. 1262

Under the direction of this Superintendent of Power, however, at each of the power plants, is a plant superintendent who is in charge of the Steam Department activities in this plant.

The production department is under the direction of a production engineer. This is a division of the Steam Department, whose function is to serve all of the power plants throughout the system with technical advice, to furnish assistance—to actually perform the work as a matter of fact, and the testing of power plant equipment, the calculation of necessary system economies and reports, design calculations 1263 involving problems in matters of heat balance, and similar technical problems involved in operation.

The electrical equipment in the individual power plants throughout the system is operated and maintained by the Electrical Department, with again supervision under the

Superintendent of the Electrical Department whose office is in the general office building.

Q. What are the functions of the Electrical Department?

A. The functions of the Electrical Department—are you

referring to the operation of the power plants and referring to those functions?

Q. That is right. A. Stationed in the main office, in the office of the Superintendent of the Electrical Department, is the division known as the Load Dispatcher's Office, where is located the centralized control for the switching and operation of the power plants of the system. This is under the direction of a load dispatcher whose efforts are supplemented by a general dispatcher as well.

1265 Stationed at each plant is an electrical foreman, and under this electrical foreman are the various operators and maintenance men. It is the function of these latter groups to operate the equipment and to regulate voltage and frequency, to maintain plant equipment, to record operating conditions, and carry out the orders under the directions of the central supervising office through the load dispatcher.

Q. You testified that you have three principal sources of power, Avon, Lake Shore and Ashtabula. Are these principal generating stations operated under a general plan of unified control and operation? A. Yes, that is correct. Just

1266 —729—

as the system is designed as a single interconnected, unified whole, so is it operated as a single interconnected system. In matters of economy, for example, plants are operated for best economy not of the plants individually but for the resulting best economy of the system as a whole. Individual plants, for example, might if given favorable loads operate at economies better than are now being experienced, at a sacrifice, however, to the economical operation of a second plant and resulting loss in economy on the system even with an improvement in economy at an individual plant. As a result,

it is the function of the persons charged with the operation of the system in the scheduling of capacity, that that capacity be brought on the line and taken off the line in such a manner as to yield the maximum system benefits, that spare capacity in excess of the load actually being handled be in accordance with system requirements rather than the requirements in an individual station, and the operation in its entirety results in the lowest overall system cost.

I have described the functions of the Electrical Department in accomplishing this, but there are parallel functions 1268
performed in the Steam Department, plan personnel, who likewise act in some substantial measure under instructions from the system load dispatcher. For example, the actual generation of electricity, the operation of the turbo-generators is under the direction of the steam department through

—730—

the turbine operating personnel. These, however, start machines and stop machines under the direction of the load dispatcher, who is an individual in the electrical operating department.

Similarly, boiler room operating personnel charged with 1269
the responsibility of burning the fuel and generating the steam for the operation of the turbines is likewise a department of the Steam Division. Auxiliary departments are the pulverizing mill operating force, the maintenance department for the Steam Department, the mechanical maintenance personnel, the yard personnel charged with responsibility of insuring a continuous supply of coal to the plant.

Then in addition, the Production Department maintains at each plant a skeleton personnel in charge of the routine problems currently encountered, the keeping of the efficiency

1270 *Elmer L. Lindseth—By Respondents—Direct*

records, reports of operation and performance, the maintenance of certain control, and instruments, and other highly specialized equipment, but in a central office is handled the problem of system economies and system efficiencies.

Q. Do you schedule outages for inspection purposes on a system basis rather than on the basis of the consideration of the individual units? A. Yes, that is correct. In scheduling equipment required to be on the line, the first fundamental is that an accurate forecast of the load expected to
1271 be encountered shall be available and made. This is a diffi-

—731—

cult phase of system power plant operation, and one extremely important, because in the event that there is inadequate capacity carried on the line, the adequacy of service is endangered, and in the event of emergency, the generating capacity may actually be inadequate for load experienced.

On the other hand, if in the interest of conservatism or just plain cold feet there is an excess of generating capacity carried on the line, substantial loss in economy results and the situation is quite unsatisfactory.

1272 In the forecasting of peak loads then, considerable time and attention of the engineers is given. In the Cleveland system, this forecasting is done a week in advance on Thursday by the engineers of the Production Department in forecasting the loads expected to be encountered during the ensuing week on a basis of forecasting a load which will prevail in the event of clear weather, and having provided thereto, increments of additional load to be added based on the immediate outlook of weather to be expected. For example, the weather conditions for degrees of severity have different effects on the load to be experienced. In the Cleveland sys-

1273

tem, those weather conditions to which weight is given are cloudy, overcast, rain or snow and very dark. The Production Department then in forecasting the load for, let us say, today, Tuesday, made a forecast last week of the load which would prevail during the daytime peak and the evening

—732—

peak in the event of clear weather. The load dispatcher then this morning at about 6 o'clock based on the latest available weather information, Government forecasts, radio and airport reports, made a short time forecast of the weather expected to prevail at 8:30 this morning. Had the weather been what it is here, overcast, he would then add to the clear weather base predicted last week, the increment to correct for this degree of weather severity—a forecast—and the boiler room engineers then scheduled adequate boiler capacity, and the turbine room operators put on the line adequate turbine capacity to carry the expected load which would be realized.

1274

The weather increment on the Cleveland system for cloudy weather is a load 10,000 kilowatts in excess of that expected in clear weather. The corresponding increment for overcast is 20,000 kilowatts, for rain, snow or equivalent, it is 30,000 kilowatts, and weather classed as very dark is predicted to produce a peak load 45,000 kilowatts in excess of what would prevail on a clear day.

1275

The success in predicting loads is quite good, and it is quite unusual on the system that the actual load will deviate from the forecast assumed by amounts of more than 10,000 kilowatts in loads as high as 400,000, that is the load dispatcher is able with the system of forecasting and the weather

1276 *Elmer L. Lindseth—By Respondents—Direct*

data made available to him to predict the load within devia-

—733—

tions of the order of 2½ or 3 per cent. The usual experience is as small as 5,000 or even less.

Under the provisions of the system's principles of operations under which spare capacity is provided, an error of 10,000 kilowatts in load forecast does not result in any emergency condition resulting, because there is constantly provided on the system excess capacity above the forecasts
1277 by an amount of 10,000 kilowatts to take care of errors in addition to that forecast.

Q. The load forecasting is on a system basis? A. Yes; again, load forecasting is on a system basis.

The Examiner: We will take a short recess.

(Whereupon, a short recess was taken after which the hearing was resumed.)

—734—

By Mr. Hamilton:

Q. Mr. Lindseth, how is the spare capacity in the sys-
1278 tem calculated? A. After the load has been forecast, which is expected to be encountered, and after the margin for uncertainty, which I mentioned previously, of 10,000 kilowatts is added to the actual forecast, there then is required on the system, in aggregate capacity at the three power plants sufficient generating capacity to permit the emergency loss of certain equipment without impairing service.

That is, at any time the system must be so operated that the loss of a main generating unit, a turbine, will not result in an impairment of service or the loss of a boiler or of a transmission line or of a transmission cable. Those are the emergencies provided against in the operation of the system.

Those conditions are classed as emergencies and under the normal design and operation of the system, provision is made for the occurrence of only a single emergency, but provision is not made for the simultaneous occurrence of more than one emergency.

Q. Is the rated capacity of your generating units less than its dependable capacity? A. Yes. In the purchase of equipment for the system, ratings are in general quite conservative and although the nameplate capacity of a machine

—735— 1280

is definitely stated, actual experience in operation usually reveals the true capacity of the machines under normal operating conditions or test conditions, to be in excess of the nameplate capacity.

Recognizing these factors, the Company has rated its equipment—turbines, transmission lines, transformers—in accordance with available test capacities rather than specifically in accordance with nameplate capacities. Dependable test capacity is usually about 90 per cent. of maximum test capacity, realizing, of course, that ideal test conditions are not always, nor even usually, encountered in actual operation. 1281 Electrical equipment, of course, may be operated for short periods at sustained overloads without permanent damage. Boilers may usually be operated for short overloads without damage or impairment of capacities, under conditions usually described as not good conditions, but conditions permitting the loads to be carried.

Capacity is scheduled on and off the line in a manner such that excesses of capacity on the line will not prevail and on the other hand that capacities will be adequate. The number of boilers to be operated is usually more fixed than

is the number of turbines, primarily for economy reasons, however, since turbines are generally able to be started and stopped and usually consume no steam nor auxiliary energy when not operating.

—736—

Boilers, on the other hand, when not actually producing steam, are still consuming fuel in the form of radiation losses later to be made up with starting coal or in the case of certain types of equipment, actually banking coal to maintain
1283 the boiler in its banked condition.

Q. What principles are followed in distributing your system load among the various plants and among the various units in the three main plants? A. In accordance with data made available to the system load dispatcher through the production department, capacities are first operated on the system in accordance with their economy characteristics, and secondly, are loaded in accordance with clearly established principles based on their operating economies.

The principles employed are those of incremental economies. For example, in the system of three power plants
1284 connected by a transmission system, for energy to be delivered into the City of Cleveland, which is generated in Ashtabula Plant, for example, which is fifty or more miles away by transmission line, the economy of generation alone does not control the load imposed on the plant, but recognition is given to the loss which takes place in transporting the energy over so substantial a distance and in the transformation required at the receiving and sending ends of this transmission line.

The economy of generation, then, at the sending end, is

—737—

corrected for incremental line loss and the resulting economy of delivered energy is the criterion which controls the allocation of load between power plants to determine which of two or more power plants shall generate the load.

Similar data are recognized in connection with boilers, for example, and in the generation of the electrical energy, the boiler room economy is a decidedly controlling factor in determining where the generation of energy shall take place.

Q. What maintenance policy is followed with respect to your generating system? A. In order that capacity may be 1286
dependably available, it is, of course, quite vital to the operation of the system that preventive maintenance be practiced to a high degree. Equipment is routinely taken out of commission, inspected, overhauled, in advance of actual breakdown; boilers are scheduled for routine maintenance and cleaning, usually on a basis of operating hours of service, which range for the boilers on the Cleveland system, from fifteen hundred to two thousand service hours.

In the matter of turbines and generators, time of operation is again a factor, but usually because of the long duration of outage required for inspection and overhaul, they are 1287
put rather on a calendar basis and the present practice is thorough and complete overhaul once in three years at least.

Q. Your boilers at times are out of service for inspection as well? A. Yes, they are. They are out on a basis of operating service hours.

Q. So that on maintenance as well, the operation again is on a system basis? A. Yes, it is likely, for example, in scheduling the maintenance of main generators—it is not only likely, but definitely certain—that no two generators

would be out of service simultaneously for anticipated routine maintenance on the entire system.

The scheduling of equipment to be out of service is through the office of the Superintendent of Power who has jurisdiction over all of the power plants and because the system capacity on taking a unit arbitrarily out of service, the capacity of which is 10 per cent. of the system capacity—because under those conditions the system capacity is definitely impaired—the outage of machines is definitely scheduled on
1289 a system basis rather than an individual power plant basis.

The same conditions prevail to lesser degree in the case of boilers, because in all of the plants a boiler is able to be out of service under the present conditions of system rating, without reducing the maximum capacity of the station.

Q. What are the major service problems encountered in the operation of the generating system? A. The most serious

service problem in the operation of a power system of the character of that in Cleveland, with power plants interconnected with transmission lines, is the potential outage
1290 of transmission lines due to storm. A split system, for example, where a power plant is isolated, due to severance of all the transmission circuits, is a major operating problem.

It is one so serious, in fact, and so rarely encountered, that design provision is not made for so serious a casualty. The loss of a single transmission line is able to be encountered—is able to be taken in the normal stride of a system. The loss of a single line usually does not seriously upset operation. The loss of two lines often results in very major readjustments of load required to be carried on power plants, often requiring short time drastic overloading of boilers and

turbines in order to maintain frequency at such a level that the interconnected system can be re-tied, phased in, so to speak.

Q. What is your record on outages resulting from plant failure? A. Service outage resulting from plant failures on the Cleveland system is quite favorable.

Q. That is to say, you have very little of it? A. Since 1926 there has been no outage of a power plant which has resulted in the loss of service to any customer. Service has

—740— 1292

not been curtailed because of power plant failure in more than fourteen years.

Q. Your service problems, then, result, insofar as they exist, from circumstances arising outside the generating plant? A. Yes, that is a fair appraisal of the picture.

Q. Now, turning to the operation of your transmission system. What departments are charged with the operation and maintenance of the transmission systems? A. The transmission system, as I described it yesterday——

Q. (Interposing) If you refer to a map, would you identify it by exhibit number? A. Yes. Will you read what I 1293 have said?

(Whereupon, the answer above recorded was read by the reporter.)

A. (Continuing) ——as shown on Exhibit 21, embraces a substantial amount of high tension transmission line. The main transmission system is that which connects Ashtabula, Avon, and Lake Shore plants, and the sub-transmission system, which carries the energy from this main transmission system to the individual sub-stations, in its operation, is one of the functions of the Electrical Operating Department.

1294 *Elmer L. Lindseth—By Respondents—Direct*

The operation of this transmission system, its maintenance, its repair and construction, requires the services of

—741—

273 operators, 75 maintenance men, and 80 electrical construction men. These men function under the direction of a supervisory staff including the Electrical Superintendent, his assistant, a system operator, thirteen dispatchers and 36 foremen and supervisors.

Q. What are the functions of the Load Dispatchers with
1295 respect to your transmission system? A. Just as the Load Dispatcher's office is in complete charge of the operation and switching of the generating plants, so the system load dispatcher is in complete charge of the operation of the main transmission system and the sub-transmission system.

The switching of these lines, the scheduling of lines to be out of service, the handling of emergency conditions, both in transmission sub-stations and in distribution sub-stations, is the load dispatcher's duty.

During an average working day, a thousand telephone calls are handled by the load dispatchers during the three
1296 shifts.

Q. What is the nature of those calls? A. Those calls are either sent or received from the load dispatcher's office. They report data as regards loads. They report switching operations performed; they report clearance of trouble; they report the presence of trouble; they ask for instructions and, in cases of serious trouble, might even go so far as to require that lines arbitrarily be taken out of service for emergency

—742—

reasons.

In a month, the number of such calls might reasonably be in excess of 25,000 calls per month, five thousand switch-

ing orders are issued in the course of a month, and in this load dispatcher's office, in connection with the operation and maintenance of—principally the operation of this transmission and sub-transmission system, three thousand log sheets and charts are required per year.

Q. I think you testified that in addition to the load dispatcher, you had the General Dispatcher's office. What is the function of the General Dispatcher's office? A. Just as the system load dispatcher is in charge of minute to minute operations, the General Dispatcher is in charge of 1298
scheduled outage and maintenance of equipment for adjustment, for repair, for inspection, and overhauling. For example, the operation of electrical equipment, without adequate safety precautions, is extremely hazardous.

Safety is a very important consideration in the operation and maintenance of a system such as this. The General Dispatcher is charged with the duty—in the event a department would like to have a circuit taken out of service, for example, for maintenance—the General Dispatcher is charged with the duty of insuring adequate safety by providing against the accidental energizing of that circuit. Relays are 1299
a very vital part of the equipment for the operation of the system.

—743—

In the course of a year's time, this General Load Dispatcher makes requests for equipment out of commission in the amount of—during last year—2,400 such requests. Under the direction of this General Dispatcher, such duties as relay maintenance—and there were 1,050 cases last year of relay maintenance arranged for through the General Dispatcher's office—generator repairs, high line station maintenance, con-

struction, engineering department special test work and all similar functions are arranged through the office of the General Dispatcher.

Q. Where are the offices of the Load Dispatcher and the General Dispatcher located? A. Both the Load Dispatcher's office and the General Dispatcher's office are located in the general office building of the Company in the center of Cleveland.

Q. So that these functions are performed from Cleveland
1301 for the entire service area? A. The operation of the entire transmission system, the centralized control for all the power plants, and of the sub-transmission system, is controlled through the central office in Cleveland.

Q. How is contact maintained between the Load Dispatcher's office and your switch houses and generating plants? A. This contact is primarily by telephone. There are leased lines, private wires, from the Load Dispatcher's office to the power plants and to the principal transmission

sub-stations. The latter—sub-stations and power plants—
1302 are attended through the day with one or more operators continually in attendance.

In addition, at certain of the power plants, operators are located not only in the control rooms for the control of the main equipment, but are also stationed in the plant auxiliary control rooms where the power supply to auxiliaries is handled.

A typical power plant control room performs perhaps as many as 150 switching operations per month on main generating circuits, an operation which requires some degree of skill and experience and knowledge on the part of the operators.

Q. These control room operators have other functions, do they, than merely staying in contact with the load dispatcher? A. Yes, such control room operators are in charge of the electrical operation of the plant. It is their responsibility to maintain the load at the desired levels, maintain constancy of voltage in accordance with pre-established standards at the generating plants, to maintain frequency when frequency is within the control of the operators, to keep constant check on the temperatures of electrical windings, electrical equipment, record numerous items of data 1304
in the matter of loads, current, voltages, and the other numerous elements necessary for an adequate record of power plant

—745—

operation.

Q. Are all of your sub-stations manned by operators? A. No, that is not the case. Of the aggregate of sixty-seven sub-stations of all classes; namely, distribution and transmission, twenty-eight of the sixty-seven are attended sub-stations. As I testified yesterday in connection with certain of the distribution sub-stations, these are wholly automatic in their design and operation, being visited by maintenance personnel for inspection once a week, so that something of the order of 40 per cent. of the sub-stations have operators continually in attendance. 1305

Certain of these high line transmission stations require the services of two operators continuously; direct current sub-stations require two operators continuously on duty. In most cases, alternating current sub-stations of the distribution type, require but one operator on duty.

Q. These non-attended stations have to be inspected periodically? A. Yes, weekly. There are maximum reading

instruments in these sub-stations on all feeders, for example, so that at stated visiting periods, the inspector can, by reading the maximum reading on the instrument, determine the maximum load experienced during the week.

It is these data which are sent to the Engineering Department for check on the adequacy of the facilities.

—746—

Similarly, at these sub-stations, there are usually installed automatic reclosing devices, so that on a distribution
1307 feeder, for example, in the event of just momentary temporary trouble, although the feeder may, itself, trip out, the automatic reclosing device will reclose the switch after a stated period, arbitrarily determined—in our case twelve seconds—and in the event the trouble has then cleared the feeder will be restored to normal service.

On the inspection a week later, the fact of that tripping will be noted from a counter and the operation will be reported to the General Dispatcher's office.

Q. Do you have a relay division which has functions re-
1308 lating to the transmission system? A. Yes. The operation of a system of this character is—principally the switching operations, I should say—are performed through devices termed "relays" which do the thinking for the electrical system. Through the relays, switches are opened in the event the current exceeds a predetermined value—that is, the circuit is overloaded—or if there is lack of balance between the several conductors of a circuit, the relays, detecting this lack of balance, open the circuit breakers.

In the event a certain circuit is desired to operate with current flowing in but one direction, relays may be installed

to protect against the reversal of flow and will open the

—747—

switches on the circuit in the event of such reverse flow.

The relay division maintained during last year more than 16,000 relays and other devices of this character. That is, protective relays, oil switch and airbrake control devices, regulating and other control devices, and oscillographs. The number of individual jobs performed in maintaining these 16,000 devices is of the order of eight thousand. The crew required is eleven men. 1310

Q. Do you have a repair crew which operates on the sub-stations in the transmission system? A. Yes, the repair personnel for all the electrical equipment, whether in generating plants, transmission sub-stations, or distribution sub-stations, is under the supervision of the electrical superintendent, and at these high tension transmission sub-stations, maintenance of all outdoor electrical equipment is handled by these maintenance crews directed from the central dispatcher's office in Cleveland.

The operation on the main transmission system is done entirely with personnel with headquarters in Cleveland. 1311 The sub-transmission system, however—the 33,000 volt lines, in areas substantially removed from Cleveland, for example, as shown on Exhibit 21 in the area in the vicinity of Ashtabula, or in fact, any of these three counties east of Cuyahoga County—such maintenance of sub-transmission

—748—

stations, distribution sub-stations, is carried on with local personnel.

Q. I believe you testified that you have approximately 450 circuit miles of 132 kv. line located on steel towers. How

are those lines maintained? A. The maintenance of those lines is the function of another department and is performed by the Line Department as distinct from the Electrical Department.

The Electrical Department is concerned with the operation of the sub-stations and the power plants and the devices within those power plants and sub-stations for the operation of the line, but the actual maintenance of the towers, the insulators, the right of way and the like, is performed by
1313 another department known as the Line Department.

Q. Those towers have to be climbed periodically, do they, and inspected? A. Yes, in the routine patrolling of the system, those towers are climbed and whatever of maintenance work is suggested by the annual inspection of those towers, is performed.

Q. Do you have a transformer maintenance crew? A. Yes. In the transmission sub-stations and in the power plants, equipment of the character of transformers, power transformers, for changing the voltage of the energy, are under the jurisdiction of the Electrical Operating Depart-
1314 ment, and a specialized division of this electrical operating

department does maintain these main transformers, regulators, potential and current transformers, and similar highly specialized equipment required for the operation of main transmission system and the sub-transmission system.

The number of such units of equipment is 470 main transmission and sub-transmission system transformers, and the range in size is from 300 to 18,000 k. v. a. These, again, are under the jurisdiction of the system—the General Dispatcher's office.

1315

Q. You have station maintenance crews? A. Yes, just as the power plant maintenance personnel is handled centrally, so the main transmission maintenance personnel for main transmission sub-stations is centrally controlled.

Q. In the inspection of this equipment and its maintenance, are safety factors important in prevention of accidents? A. Yes, the hazard of careless operation is very great and the number of potential accidents is appalling. The actual number of accidents is very, very low, due principally to far-range safety planning, active and energetic work on the 1316
part of the safety department in stressing the necessity for safety to all men, and in the case of the Electrical Operating Department, the division charged with this high tension transmission line sub-station operation, a special safety man is a full-time employee of that department alone, whose duty

—750—

it is to investigate possible hazards, to investigate actual accidents, and, in the course of a year's operating, to make recommendations for the mitigation of hazardous conditions.

Q. I believe you testified that the company does the greater bulk of its own construction work. Do you have an 1317
Electrical Construction Division? A. Yes, in the matter of transmission sub-stations, for example, the construction of the building is in all cases performed by building contractors, but the installation of the necessary equipment, the wiring, the setting up of switch-boards, the actual placing of the equipment, is the job of the construction division of the Electrical Operating Department. All major repairs are virtually of the nature of construction and since the personnel must be maintained for such emergency repairs, construction is a natural adjunct to maintenance.

1318 *Elmer L. Lindseth—By Respondents—Direct*

The work done last year, for example, involved the construction of two whole new sub-stations, installing five new transformer banks, installing new lighting systems in eight sub-stations, the installation of a number of feeder positions in existing sub-stations, and the removal from one of the older power plants, Canal Road, of a 3,750 kilowatt generator that had been retired from service.

These were all functions of the construction division of the operating department.

1319 —751—

Q. What are the principal service problems encountered in the operation of your main sub-transmission system? A. These are the storms and loss of transmission lines to which I referred in connection with the power plants. When a storm of high intensity is experienced over a substantial portion of the entire system at a given time, very substantial damage can result, not so much from the effect of the storm on the transmission lines or sub-transmission lines, themselves, so much as the mechanical damage which results from a tree being up-rooted, for example, and just being driven against
1320 a line and mechanically just taking the conductors right out of service.

For example, in 1931, the most severe storm probably ever experienced on the Cleveland system occurred in June and the first reports of a disturbance in the territory were received by the load dispatcher at about 8:30 in the morning. Very elaborate facilities are available to the Load Dispatcher's office to determine the presence of bad weather—radio service, telephone service, United States Government weather reports, contact with Load Dispatchers in adjoining communities, other systems.

Since Cleveland is interconnected with the Ohio Edison Company, the Load Dispatchers of the two systems are in telephone contact. Immediately, on receiving reports of major disturbances in the territory, men are dispatched to these normally unattended sub-stations in order that

—752—

they may be there in the event of emergency resulting from storm. By 8:45 that day, a storm of mild intensity moved over the system, tripped a few feeders and high voltage lines, but these were restored substantially immediately. 1322

By 10:15, however, the storm had reached the eastern limits of the system, and several severe storm areas developed simultaneously over this entire northeastern section of the system. Wind velocity rose to forty miles an hour. The rain exceeded one inch in a very short time. Thousands of trees were damaged and uprooted, blown into the transmission and distribution lines; hundreds of feeders were tripped; many circuits could not be re-energized because the damage had either taken the lines right down or there had been permanent damage to exposed equipment.

Under such conditions, every employee available is put 1323 to work restoring service. Engineering Department engineers, for example, were drafted to assist in the Dispatcher's office in recording data from office records; sub-stations are serious trouble in many cases—or were in this case—because sewer capacities in the communities were inadequate and water backed up in the basements, flooding essential equipment.

During all this time, however, the generating plants were unaffected, and the main transmission system was unaffected.

—753—

1324 The sub-transmission system was that principally furnishing the problems primarily through the 33,000 volt exposed overhead lines.

It is cases of this class which are the major operating problems for a department like the Operating Department to contend with.

Q. Do you have a Lines Department which operates? A. Yes. The operation of the transmission system and the sub-transmission system from the point of view of the switching
1325 of circuits and the stations is controlled by the Electrical Operating Department, but the actual maintenance and patrolling and operation of the lines is by the Line Department.

These are in charge of not only overhead but underground lines as well, of all voltages, and in the case of distribution the same line department actually handles distribution as handles transmission.

Not only do they take care of operation and routine maintenance, but the Line Department is likewise charged with the responsibility in construction, in pre-construction field
1326 engineering, in construction of underground subways, installation of cables, the maintenance of the right of way, locating trouble, and a vast number of problems in connection with so far-flung a system as the lines of this company.

Q. All the maintenance of these lines is done through

your own facilities—through your own personnel? A. Yes, they were all built by the company's personnel and they are all maintained by the company's personnel.

Q. That involves periodic patrol work? A. Yes, the 132,000 volt system, itself, last year required for maintenance 41,000 man-hours of labor. This, in connection with

the maintenance of the lines, exclusive of the sub-stations. The 33,000 volt overhead lines similarly are under the jurisdiction of the Line Department, and there, too, the maintenance work, like the construction work, is done exclusively by company personnel.

Q. Does the inspection of your other lines require a substantial amount of hourage, and work a substantial personnel? A. Yes, the operation of the 33,000 volt system last year, in construction and maintenance, required 23,000 man hours of effort. 1328

In the maintenance alone of the underground transmission system, 10,000 man hours were required.

This latter covers the inspection of relays and pressure tanks for 66kv., 3-conductor cable, the monthly inspection of joints and terminals, and, in certain cases, a yearly inspection of certain single-conductor 66 kv. circuits.

Other work necessary to be done was caused by twenty-eight cable failures which occurred over the system.

Q. Now, have you told us how frequently these high ten-

sion lines are inspected? A. This high tension system is 1329 patrolled by operating personnel in this department actually walking over the entire length of the line twice a month. The distance from one end of the system to the other, including the branch circuits, is 128 line miles. This distance is walked, summer and winter, in all kinds of weather, every two weeks.

In the event of an emergency tripping or an unexplained case of trouble on a line, this patrolling is necessary to be carried out by night as well as by day.

The operating or maintenance personnel consists of two gangs of fifteen men, making up two crews in skeleton form

at least, and in order that all men may be thoroughly familiar with the entire system—because in emergency there is no opportunity for education; a person must be able to handle these things intuitively—these men are rotated in the sections of the lines which they patrol throughout the year. There are twenty inspection zones, so that the amount of patrolling required in a single day is not excessive.

This high tension transmission line in many cases is through farm type country, in many cases through woods,
1331 across some substantial gullies, valleys, rivers, creeks, and very often to get from one tower to the next tower, only seven hundred feet or at most a thousand feet away, may require going by a very circuitous route. The walking is not too bad,

—756—

neither is it good.

Access is available to all of these transmission towers—in order that trucks may actually drive up to the tower for the replacement of major equipment, but the patrolmen do not take the roads over which the trucks go, rather they take the direct route and patrol the line. They inspect with
1332 field glasses, insulators for flash-over and breakage, usually caused by lightning. They look for burnt spots in the line indicating flash-overs; they look for frayed splices, bad clamps, similar items of routine maintenance on the line.

Q. The right of way, itself, has to be maintained? A. Yes. One of the hazards to these transmission lines is trees growing into the lines, so that the presence of so-called danger trees it noted by the inspector on his patrol, and proper report is made out and the maintenance crew removes such hazards.

Where the company owns the transmission line right of way in fee, the brush is cleared and mowing is done, and where an easement is obtained and objectionable conditions are noted, the person from whom the easement has been obtained very often relieves the situation.

Fences are a real problem, since good relations require that we do not unnecessarily or unjustifiably damage any property belonging to others, so that gates are constantly kept in repair for these access lanes, fence wires are grounded

—757— 1334

in order that voltages are not induced which might result in danger, wash-outs resulting in erosion of land under foundations must be carefully watched lest the towers be weakened, broken culverts and similar problems are always a problem in the maintenance of such equipment.

Q. Have you had instances of loss of a whole tower? A. Yes. Through no cause of the Company's, in 1935 one of its transmission line towers was dynamited. The person, who was later apprehended, and who had been responsible for this, had thought he was going to disrupt the power supply to a factory in a community that we don't even serve, where 1335 he or others were out on strike, so that the company was an innocent victim, but a very real victim of this bombing—dynamiting, I should say.

The dynamiting occurred at night and it was one of two parallel transmission lines, and the dynamite had been so placed that the inner two of the four legs supporting the tower were, both of them, so damaged, that the tower fell over on to the adjoining or the adjacent line.

This resulted in the tripping out of the two inside circuits of the double circuit power lines. That is, there had

been two tower lines with four circuits and when the one tower line had tipped into the other, the inner circuit immediately tripped out. It was not until the next day that the cause of the trouble became known and then repair of the

—758—

damage was somewhat delayed until the authorities could investigate the damage, but by noon, reconstruction work was begun, the tower was hoisted into its normal position, new legs attached to the old tower, and by evening, the serv-
1337 ice was normally restored.

Q. Was there any service interruption as a result of the loss of the tower? In other words, you had the two additional circuits on your other line to carry the load, is that right? A. Yes. Whether there resulted the loss of any customer service, I can't say, in connection with that outrage. The fact that it occurred at about midnight would make very likely that no service was interrupted because system loads are normally very light, and I do specifically remember that day that very substantial excesses of generating capacity were put on at the Lake Shore plant, and it is
1338 not unlikely that the amount of service interruption was very slight from such a failure.

Q. Now, in addition to the maintenance and inspection work on the overhead transmission lines, you have similar work to devote to the underground cables, do you not? A. Yes. The underground maintenance foremen all serve as inspectors on problems of this character, and in connection with their construction or operating work, routinely report to the General Dispatcher any jobs suggesting maintenance to be done.

—759—

Such equipment in underground manholes as junction boxes, oil switches, similar equipment, are routinely inspected and tested every year.

Reservoirs of oil-filled cable are inspected each year. Pressure tanks on three-phase oil-filled cable are inspected every two weeks and manholes of this class are inspected every three months. Cables are particularly susceptible to damage from stray electrical currents, from the effect of electrolysis, and a special crew, routinely, on an annual basis, inspects cable sheets for electrolysis damage. 1340

In connection with the repair of such damage and the repair and construction of subways, excavation, of course, is a very important part of the job. Such excavation is, where possible, done by machine, but in densely populated and congested areas, machine digging is becoming increasingly difficult because of the number of obstructions encountered.

Q. Those obstructions, I assume, may be of varied nature —water? A. Of the widest variety. In any city, the number of utilities requiring space in the streets is very large. 1341 There are water lines, gas lines, sewer lines, telephone conduits, telegraph conduits, electric power conduits, certain other signal systems sometimes associated with the street railways, for example. Historically, these have been built in accordance with many standards. They are of varying depths and run in varying directions.

—760—

The greatest of difficulty is now experienced in any major city in putting an underground line through at any reason-

1342 able depths, because of these obstructions encountered. Some of them have been there for a very great many years.

For example, the first street lighting in Cleveland was installed well before the existence of the Cleveland Electric Illuminating Company as such. Yet, in a recent construction job, the foundation for an enormous street lighting tower was encountered underground which had never been removed. In the early days in Cleveland, fire protection was realized by fire engines pumping water from some kind
1343 of fire cisterns which were buried in the streets and these are even yet encountered in construction jobs occasionally.

Q. What are the major service problems encountered in the maintenance and operation of the underground system? A. Well, the major service problem encountered in the operation of the underground system is cable failure, burnout of the electrical conductors, and the location of the precise point at which this cable has failed often is a problem of considerable perplexity.

For example, a circuit may be five or more miles in length and it is known only that there is a defect some place
1344 in that ground from one end to the other. The ingenuity and the skill required to detect the location of that failure, in

order that good cable not be removed between manholes, but only the damaged cable be removed, that skill and ingenuity must be of a high order. That is the principal problem in connection with the operation of the underground division.

Q. These cables are located in conduits, are they? A. Yes, underground cables are carried in what is known as subway, which consists of one or a number of fiber tubes encased in concrete.

1345

Q. What width, roughly? A. The fiber tubes are in diameter, the very earliest of them, three inches; the more recent ones now being installed in our system, four and a half inches in diameter. These run between manholes which are spaced at varying distances and the cable is then pulled through the resulting—or the duct which is installed in this concrete-encased envelope. It is very often between manholes that the cable has failed and the cable must then be pulled out, a new, good length pulled in and spliced at the two ends in the manhole.

1346

Q. So that in making the repair, you don't take down the street, but operate from the individual manhole inward? A. That is right. The number of actual street openings required in the maintenance of the underground system is very, very small. It is only when due to wash-out through a leaky sewer or a burst water pipe, that the actual concrete envelope has lost its support and has actually sheared, that it is necessary to dig up the subway and repair the subway.

—762—

Deterioration of concrete-encased subway, buried under ordinary conditions, is very, very slight. The failures are usually failures of the cables rather than the subway containing the cables.

1347

Mr. Hamilton: This again is a convenient breaking point, Mr. Examiner.

The Examiner: All right, we will recess until 2:00 o'clock.

(Whereupon, at 12:30 o'clock p. m., the hearing was recessed until 2:00 o'clock p. m. the same day.)

—763—

1348 *Elmer L. Lindseth—By Respondents—Direct*

AFTERNOON SESSION

(The hearing was resumed at 2 o'clock p. m.)

The Examiner: You may proceed, gentlemen.

Whereupon ELMER L. LINDSETH resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

1349 Q. Turning now, Mr. Lindseth, to the company's distribution system, will you state what departments are charged with the maintenance and operation of the distribution system? A. The distribution system is in part overhead and in part underground. The operation and maintenance, however, both in the overhead and the underground phases is in charge of the Lines Department.

The distribution system comprises the portion of the property from sub-stations to customers, the circuits have a range of voltages from 2,300 to 33,000, with the latter in general used for the supply of industrial customers at sub-
1350 transmission voltage, the lower voltages, 2,300 and 4,600 being used for the primary distribution system from which numerous small customers, such as residential and general commercial would be served.

The maintenance of such a system involves the replacement of poles, damaged either by accident or by decay, re-

placement of wires due to deterioration or actual breakage due to storms, trees blowing across them and the like, transformers which have burned out, fuses which have burned out, underground cable which has failed due to electrolysis dam-

aging the cable sheaths or other causes, and in addition the maintenance of consumers' services.

The responsibility for the latter, particularly the service entrance equipment into a house and including the consumer's meter is the responsibility of the service department as distinct from the line department.

Within some limits of flexibility, the responsibility of the Lines Department would be between the sub-station and the pole serving the customer, and the responsibility of the Service Department would be for that portion of the facilities 1352 between the pole and the consumer's premises.

This system is far-flung and covers the entire 1,700 square miles of the service area, and requires for this maintenance the service of 4,800 miles of line and 16,000 miles of wire.

The entire distribution system with extremely minor exceptions was constructed by the construction forces of the company. The exception to which I refer is the portion of the distribution system that would still survive from properties which were purchased during the period of expansion of the company from 1925 to 1929. The aggregate property purchased was $6,000,000, of which, however, $1,000,000 1353

—765—

remains today in the fixed asset accounts of the company.

The property acquired was in general not of a standard of construction adequate to meet the company's service needs. In some cases, the standards were different from those followed by the company, and further than these, the property today is 10 or 15 years older than at the time of purchase, for which reason very substantial amounts have been retired.

With that single exception, then, the entire distribution system having been built by the company is maintained by

1354 *Elmer L. Lindseth—By Respondents—Direct*

the company as an integral or an interconnected single system.

As to the underground system, there are substantial parts of the distribution system which are built underground, particularly in the vicinity of distribution sub-stations where the number of circuits is very great and where overhead construction would be quite objectionable from a public relations point of view.

Q. The construction work and the subway distribution
1355 is done by your own personnel, is that right? A. Yes. As is the practice in other phases of the underground system, the distribution is by the company's forces.

Q. Is this large extent of distribution mileage and wire mileage subject to various hazards by storm and other circumstances? A. Yes, particularly storms. The territory of the Company is in a rather severe storm belt in the country.

—766—

The design is premised on rather severe wind and sleet loads, and while standards of construction are strictly first class,
1356 still the danger of mechanical severance of the circuits is so substantial that maintenance of service in times of storm is a severe operating problem.

Q. Can you illustrate that point? You spoke in your previous testimony of the storm in 1931 that had a direct bearing on the transmission facilities. A. Yes; in connection with the storm that I previously discussed of substantial intensity, throughout the company's service area, the effect of that storm on the distribution system was far more widespread than it was on the transmission system in connection with which I discussed.

1357

For example, the particular storm in June, 1931, which was in reality three storm centers in the company's system, at various times during the storm, one-third of all of the Company's feeders were out of service. Most of them were restored, however, on the first day of the storm, and practically all of them by midnight.

Under this severe case, and it is by no means to be regarded as a normal or casual incident, 60 poles were broken over, 187 transformers were replaced, 13 oil switches, 35 primary boxes, 26 lightening arrestors, 11 series transformers, and 1,075 transformer fuses were required to remedy the damage.

1358

—767—

That would be definitely an extreme case, but it is illustrative of the magnitude of an emergency for which a routine operating personnel must be maintained against the occasional hazard.

Q. A situation like that requires really then, does it not, the services of a large organization, is that right? A. That is definitely true.

1359

In connection with that, there is required in order that service interruptions be not too severe, that the system be interconnected to operate as a whole, with emergency crossties between one distribution area and an adjoining area. That is a fundamental of design in construction which is very vital to the adequate operation of the system of this character.

Q. What is the customer record on company outages? A. On the average over the entire territory, a customer of the company experiences an outage of once in five years.

1360 *Elmer L. Lindseth—By Respondents—Direct*

The average duration of such an outage is about 45 minutes, so that the average duration of outage per customer per year is something less than 9 minutes. These are the records computed for the year 1938. Corresponding records for 1939 have not been computed.

The figures must not be construed to be that this is the record for either a particular customer nor for every customer, but is the average effect on all customers. Many customers, of course, suffer no outage. Many customers, un-

1361 —768—

fortunately, suffer outages of considerably greater duration and considerably greater frequency, but in the aggregate, this is the composite effect.

Q. How much work is involved in maintaining these various distribution lines in the system? A. As of last year, more than 270,000 man hours were spent in emergency repairs and maintenance of the distribution system, and the restoration of the customer's services. Of this total, about 25,000 hours are spent on underground work and 245,000

1362 hours on overhead.

The jobs entailed the emergency replacement of 186 broken or damaged poles, 202 fallen wires, 142 burned out or damaged transformers, 110 cable failures, and the necessary additional emergency replacement of equipment arising during operations. There were required from the public to apprise the company of this service outage situation, 120,000 telephone calls to be received and handled.

Q. How frequently are the poles and the distribution lines inspected. A. You are speaking now of routine inspection?

1363

Q. What would you tell me on routine inspection? A. In accordance with the company's practice of adequately anticipating maintenance to avoid failure in emergency, the company practices a policy of continuous inspection of over-

—769—

head distribution facilities. The territory of the company is divided into a number of inspection areas to which individual inspectors are assigned, and the areas are so fixed in size that all of the facilities within the area may be examined each year.

1364

Q. And of course, in emergencies of the character you have mentioned, that extent of inspection or frequency of inspection may well be increased, is that correct? A. In the event of major emergency, there is likely to be after the emergency damages are repaired, an additional inspection of the system to detect residual damage which had not been repaired by the emergency clean-up crew.

Q. Is the purpose of the inspection not only to discover breakdowns that may exist, but also to estimate future life or anticipated life of particular segments of the line? A. Yes, in connection with the routine inspection of facilities

1365

by the district inspector, estimates are made of the estimated surviving life of the individual units of property.

For example, in the event that a major job is to be done on a pole, or to change a transformer or perhaps to change cross arms and air conductors and the remaining life of that pole were to be but two or three years as estimated from the condition, or perhaps that the ground line were rotting and ultimate failure takes place, it is economical to forego the two or three years of remaining life of that pole and re-

—770—

place it at the time the job is being done with a new pole, since the cost two or three years hence of then replacing the pole by expiration of its ultimate life would exceed the value of the two or three years of additional service which could potentially be realized.

For that reason, these inspectors in their district inspections, not only report on the condition of equipment which is in need of immediate replacement, but likewise are called upon to pass judgment on the economy of replacing
1367 equipment before the expiration of its ultimate life when major construction is being done in the vicinity.

The same prevails, for example, if two poles were being replaced, one on each side of a third, and the third were to have an estimated short additional remaining life, with the construction crews in the neighborhood, with the poles being transported to the job, the economics almost invariably suggest the replacement of the middle pole prior to the ultimate expiration of its life.

Q. In addition to problems created by storms in the service of these lines, are there any other service problems which
1368 require solution in maintaining the lines? A. The system of the company is in a rather heavily wooded section of the country, and one of the severe obstacles in maintaining continuity of service is the problem of tree troubles on overhead distribution lines.

For example, at 2,300 and 4,600 volts, although the conductors in the distribution system are insulated, the presence of a wet branch across two wires results in the outage of that line until the branch is either removed or the conductor is burned clear. This is a typical case of tree trouble. The

problem is solved in one of two ways—either by the erection of very high poles and the distribution is carried over the tree tops, or else the trees are trimmed and the pole lines carried under the tree branches to avoid this interference.

The second of these solutions is not as good as the first, since falling branches can drop on the wires. It is, however, much cheaper from an investment point of view. Construction of high pole lines over the tops of trees is first of all expensive, and secondly is often only a temporary expedient, because the trees are likely to continue to grow up into the 1370 wires.

Q. What has been your experience with wires down due to falling branches of trees? A. Again, in the aggregate, the outages due to wires down is only one outage per year per 100 miles,—a good figure. But in specific cases, individual feeders may have a very much poorer record.

For example, there has been experienced in the past a condition so serious on one feeder as to result in 35 outages per 100 miles of wire per year. This is a condition, however,

—772— 1371

more serious than the company can tolerate, and a line suffering so poor a record of service reliability is rebuilt and replaced with the problem eliminated by one of the two methods I have described.

In the trimming of these trees, the company does not use its own construction or maintenance personnel, but in all cases hires professional tree trimmer service companies to do the job.

This is obviously better from a public relations point of view because consumers prefer to have their trees trimmed

by experts. Actually, too, it probably results in an improved job due to the skilled persons of more experience in this problem.

In 1934, the entire problem of tree interference with distribution systems was studied and a comprehensive analysis based on which study it was determined that certain areas of the company should have the trees trimmed on a routine basis every year. In certain other areas, the trimming on a two-year basis was found to be adequate, and in
1373 the rest of the system on a three-year basis. Such areas are plotted on a map and the frequency of trimming is changed as experience shows of the conditions that have changed.

As the result of such a comprehensive approach to the problem, the feeder which I had mentioned which had suffered an outage of 35 times per 100 miles per year was reduced in the number of outages to 5 outages per 100 miles per

—773—

year.

For the system as a whole, prior to 1933, a three-year average of all cases of wire down due to tree trouble was
1374 7½ times per 100 miles per year.

As a result of these efforts, the aggregate effect has now been reduced to the figure I have mentioned of one wire down per 100 miles per year for all causes including tree troubles.

Q. In general, would you say that extensions are being made all the time in the distribution lines, in additions, and so on? A. Yes, that is correct. Because the area is in neither the urban sections nor the rural sections 100 per cent. served, and in accordance with the file schedules of the company, there are line extension schedules under which the service

1375

facilities are extended in either urban areas or rural areas and construction takes place each year.

Q. In other words, within the service area shown on Exhibit 21, a gradual process of increased saturation of lines is taking place, is that correct? A. Yes. Last year there were built 90 miles of new distribution lines. This construction of 90 miles of new line required the setting of 3,700 poles and 400 miles of wire. The jobs required 300,000 man hours of work, and resulted in substantial extension of the company's facilities.

1376

—774—

The rebuilding of lines is usually occasioned by the inspection reports of these district inspectors who had reported conditions of such a character as to justify substantial rebuilding or from load growth in a territory requiring the additional facilities to a pole line, such efforts requiring rebuilding of 110 miles of pole line, replacement of more than 4,400 poles, and the expenditure of more than 330,000 man hours. This work entailed the installation of 5,400 transformers, the removal of more than 4,200 transformers, and numerous supplementary items of incidental equipment, pole line hardware, guys, and the like.

1377

Q. Would you expect this tendency toward increased saturation of lines within the territory to continue? At least, with respect to your record in the past. A. For the immediate future, yes. The construction of new lines will definitely continue for the near future. The rebuilding of existing lines will likewise continue. In general, load density is increasing. The energy consumed per customer is definitely on the increase, and in the areas where distribution facilities are now existent, vacant lots are being built up

1378 *Elmer L. Lindseth—By Respondents—Direct*

with houses and apartments and small factories are being located, and in many cases the existing facilities will be found to be inadequate and require reconstruction or rebuilding. That effect will without question be with us for a long time. —775—

Q. Do you have a consumers' service organization? A. Yes. All contacts with the consumers are maintained and carried on through a consumers' service organization. Through this organization, the meters are read, the applica-
1379 tions for service are made, the requests to have service facilities increased are made, and it is through the many contacts of this consumers' service organization with the public that the company is able to maintain a high standard of public relations with the consumers.

This group in addition to the functions I have mentioned, handles the inspection services on consumers' premises, and in general is charged with the physical property of the company between the pole and the consumer, and the relations with that consumer.

Q. Does it answer inquiries as to lighting problems? A.
1380 Yes, all inquiries to the company, whether related to problems, bill complaints, applications for change of address in the event of moving,—all such inquiries and complaints are handled through the consumers' service organization. A very large number of telephone calls which I mentioned previously, 120,000 in number received by the company each year to report to service outage or similar problems are made through the consumer service organization. These outages calls are accepted and received through 24 hours of the day.

In addition to service calls of a trouble nature, 90,000 calls are received pertaining to meter transactions, 8,000 in-

—776—

quiries are received in regard to bills rendered. This is a substantial activity of the company and requires 9 per cent. of all of the employees in the service of the company. As of the end of last year, 337 employees were engaged in the service efforts of the company.

Q. You spoke of meter transactions. What do you mean by that? A. A meter transaction may perhaps be described as the request of a new consumer on moving into a premises to have the meter charged to his account, and similarly on his moving from a premises, to have such a meter discon- 1382
nected in his name and blocked, so-called.

Q. Now, as to these calls which relate to service to the consumers, that is customers' complaints, let us say, what is the nature of those calls? A. Of the 120,000 service calls received from customers, 90 per cent. 110,000 of them, are so-called no-light calls. A consumer calls the service department and says, "I am without light; will you fix them?" Of these No-Light Calls, 100,000 are from residential and small commercial customers, and all but 10 per cent. of these are caused by troublesome conditions over which the company has virtually no control, that is a loss of service has been 1383
occasioned from conditions arising on the consumers' own premises, such as faulty wiring, faulty equipment, overloads

on inadequate wiring systems, amateur wiring by the boy in the family, and similar problems. 6 per cent. of them are considered as street lighting calls, calls made by customers to report that the street light in front of the house is burned out. 3 per cent. of them are emergency calls of a serious nature reporting wires down, trees on the wire or other

problems requiring emergency action because the safety of the public is involved. About 1 per cent. of the calls are no-power calls from large commercial and industrial customers and others where different type of maintenance and trouble personnel is required to remedy the emergency.

Q. What is your record in meeting these emergency calls as to the time required? A. In connection with the statistics I gave on the average duration of outage of 45 minutes per year, that is the overall time required from the receiving
1385 of the service call from the consumer to the restoration of service to the consumer. It does, however, likewise include outage caused by failure of the facilities on the company's own equipment, such as the sub-station or a cable over which the consumer has no control.

Q. These meters on the customers' premises are tested, are they not, from time to time? A. Yes. In accordance with the Company's practice of routinely testing and inspecting meters in an average year, 80,000 meters are re-

—778—

1386 moved from the premises and are tested in the meter laboratory. During a similar period, a year, 9,000 meters are tested in the field.

Q. How is that done? A. Meters in the laboratory are tested on a meter test board in which are carried phantom circuit, so-called. The meter circuits and the meters are tested under conditions simulating actual service conditions of load, voltage power factor, and similar conditions. Service meters, as would be expected from the volume of the work—80,000 per year—are tested on a production basis. Special meters of the industrial type or handled in a some-

what individual manner and often each is a specialized problem.

Testing in the field is similarly against standards which are calibrated in the company's research laboratories. Some meters in particularly difficult service installation conditions are tested at rather frequent intervals. The others, when installed under service conditions such that the deviation from theoretical accuracy is not likely to occur and if it does occur not likely to damage such meters are tested on a much less frequent schedule. 1388

Q. Where do these calls which reach the consumers' service organization come? A. The major portion of such calls are made to the main office of the company in Cleveland.

—779—

In the outlying districts, such as the territory represented by the eastern portion of the system as shown on Exhibit 21, in such areas the calls are made to one of the 9 branch offices which serve this entire territory.

In quite rural territory, referring to Exhibit 21, such as Orwell, for example, a local service representative is permanently located there. Similarly, in the village just north 1389 of Orwell at Rock Creek, a service employee is permanently located there. Those are towns about 8 miles apart, but in order that the service may be made available on a 24-hour basis throughout the week, arrangements are made with the telephone company that in the event a service call is received in Orwell and the local representative is unable to be reached, that call is sent to Rock Creek, and vice versa.

Similarly, in relieving these persons, since 24-hour duty is arduous, these men exchange Sundays off, for example, and a problem of Sunday maintenance in one city or one

1390 *Elmer L. Lindseth—By Respondents—Direct*

town in the event the local representative is at the ball game, is handled by the telephone operator adjoining that town.

In this manner, while the control of the service policies throughout the system is largely centered in Cleveland, the advantages of localized service are realized.

The number of these local branch offices is 8, outside of the main office in Cleveland, of which 7 are in the territory outside and to the east of Cuyahoga County. One of these 7

—780—

1391 is right at the edge of Chagrin Falls. These local branch offices are located at Ashtabula, Chagrin Falls, Chardon, Conneaut, Fairport, Geneva, Jefferson, and Mintor.

Q. What is the function of the branch offices in each of these areas? A. From some of these branch offices, construction work is scheduled. The line foreman reports there, the scheduling of material has to be handled on the job is made through the office. In all cases, applications for service are received and handled through these branch offices. They afford opportunities for these consumers to pay bills, to make complaints if they care to, to have service increased

1392 or changed. Those, I think, are in general the functions of these branch offices.

Q. You have spoken of a so-called local representative. What is his function? A. The local representative in an area where there is no branch office is to represent the company in virtually all of its phases of contact with the consumer requiring local contact. The usual contacts between the customer and the company requiring so-called local management or local representation are in general to apply for service or to discontinue service, to pay a bill or to report a case of trouble or lack of service. Those three efforts con-

stitute the vast majority of the company's contacts with its customers.

—781—

Hence, in the territories where the volume of business is inadequate to maintain even a one-room, one-man branch office, there is still a local representative such as I have described in the villages of Orwell and Rock Creek.

Q. Who operates from his own home? A. He operates from his own home. He reads the meters in the territory, he has a car, a company car, and handles minor cases of 1394
trouble. To him are reported lights out on a farm or a home; he fixes them. He installs service as required within his ability. He in general is the Company in his territory.

The listing in the telephone book—and this is a local village telephone book in Rock Creek—the local service man is Mr. Henry Robinson, listed as C. E. I., trouble man, number, Rock Creek 2441. If no answer, call Orwell No. 122-A.

Off the record.

(Off the record.) 1395

Resuming now,—in this far-flung territory where load density is not great, service requirements are extremely difficult. However, although distances are great, traffic congestion is not a serious problem, and the average time required to handle a case of trouble reported in this eastern portion of this company's system where the distances are small and the lines are rural, the time required to handle trouble there is no greater than is required in the city of

—782—

Cleveland where the distances are much shorter but the traffic congestion much more severe.

In connection with this service activity, one of the opportunities for improvement of public relations between the company and its customers arises out of a situation where the consumer's bill is going to be awfully high. When the company on its routine meter reading finds that the energy used by a consumer has very drastically increased, the company in advance of sending out a bill to that consumer,
1397 sends an inspector to the premises to determine the cause of the drastically increased use. This has been very beneficial to the company in its maintenance of public relations. The inquiry by the inspector of the customer usually takes the form of a question whether that consumer has bought some new load consuming device or what it is that has brought about his greater energy consumption to a figure very markedly higher than it had been in the previous month. In many cases, the company is aware of this increased use that his meter has shown because of the purchase of a major appliance, because of increased use due to
1398 illness or other causes, but in many cases that is not at fault directly; the wiring may be faulty in the consumer's house, the consumption may be drastically increased because of a ground circuit in the wires; and a genuine favor has been done that consumer telling him of his increased consumption and the responsibility is his to fix the wiring and

maybe a wrathful customer has been saved in his good will to the company through the use of these inspectors.

The volume of this questioning of abnormal bills is rather substantial. 36,000 calls were made in 1939 at the

request of the Consumers' Accounting Department to determine this cause of abnormal use in advance of billing the customer. In addition to these 36,000 calls made at the request of the accounting department, 12,000 additional calls were made in response to consumers' requests to determine the cause of increased use after receiving bills.

Portable meters are sometimes installed on the consumer's premises to check the current consumption of new apliances, refrigerators or ranges or other energy consuming devices when the curiosity of the customer as to the energy consumed 1400 justifies his making the request.

Q. In Cleveland proper, how do you handle service complaints or inquiries? A. In Cleveland proper, and by Cleveland proper I refer to Cleveland and its suburbs shown on Exhibit 21 as substantially all of Cuyahoga County,—this area is divided into 12 districts, each of which is subdivided into sections ranging from 3 to 10 sections per district. Trouble crews working in overlapping shifts are assigned to these sections of districts. A trouble crew is a one-man or a two-man or a three-man crew, depending upon the local

—784— 1401

conditions and the character of the territory served. Trouble calls are received in the central service department of the company, they are received usually by telephone, and a notation is made in this service organization of the nature of the trouble, the location of the trouble, the service report is then turned over to a trouble department whose function it is to restore service in accordance with the requirements. The trouble dispatchers have before them also a large scale map of the company's areas on which there are continuously indicated the then present location of any trouble crew.

For example, if in response to a trouble call, crew No. 4 is dispatched to a certain address, such address is indicated with a tab on this map. Before leaving those premises that trouble crew calls in the office to inquire as to his next assignment, and it is this trick which results in cases of trouble being cleared up in these astonishingly short times that we like to talk about.

For example, not infrequently they will call up reporting failure of lights or loss of service, and the trouble man will
1403 be able to report to those premises within a short time as one minute or two minutes, quite bewildering the customer. The answer is, of course, that the trouble crew is just next door or just across the street, and has just completed a job and called in the office at the time that the new trouble call was

—785—

received, and the trouble crew was able to walk across the street and ring the door bell and say "We are here to fix your trouble."

We like to talk about those incidents. Unfortunately, we cannot handle all cases with quite that dispatch.

1404 Significantly, the majority of trouble calls is received during the daytime. 75 per cent. of the calls on lighting trouble are received during the daylight hours. The peak is about 8 in the morning, and they continue fairly high all during the morning, decrease at noon, rise to another secondary peak at twilight, and drop off to a very low level during the very early morning hours. Accordingly, the number of trouble crews or trouble trucks in service varies during the different hours of the day, and although during the 24-hour period there is an aggregate of 30 crews of all classes, it is not to be understood that these are equally divided all

of the time. During periods of storms, these trouble crews are supplemented with auxiliary or emergency crews, and during such periods, as many as 12 of these trouble dispatchers are required on duty to handle the substantial volume of incoming calls.

In general, 16 crews serve the company during the daytime, and during the early morning hours only 2 crews are required in substantially the Cleveland area where are located about 300,000 customers.

—786— 1406

Q. Have you indicated the principal causes of outages on customers' premises? A. The principal cause of outage on consumers' premises is the addition of load quite in excess of the capacity either of the wiring or the fuses. The consequence of such excessive load conditions is of course the burning out of a fuse, the replacement of which should be the responsibility of the consumer, but which is in reality the responsibility of the company in response to a call from the consumer saying that his lights are out.

In some cases, these excesses of load reach rather substantial proportions. One of the frequent cases is that of 1407
a small meeting hall or lodge or church where normal service might be of the order of a few kilowatts, but during a period of a social or a bazaar of some kind, very substantial increases in the load are made and right at the time when the business should be at its best, the lights go out. Such a situation is embarrassing alike to the company and the consumer. It usually results from negligence on the part of the consumer to provide for the increased service requirements in advance, and requires emergency handling on the part of the company.

1408 In some cases, this situation of amateur electricians fixing up the premises results in rather serious consequences to the company, since the consumer takes amounts of energy out of all proportion to the facilities on the pole to supply

—787—

that consumer. That is, the uses in the house are substantially increased, but the overload to the transformer on the pole is so serious to either blow the fuses there or actually to result in the burning out of a transformer.

1409 Q. Are there occasions where you find it necessary to loan equipment to consumers? A. Yes, in some cases equipment is loaned to consumers for their own convenience where the company can thereby render a real service and where it would be a real hardship on the consumer to buy or rent his own equipment.

For example, there was a recent case—this does not quite illustrate the point but is applicable in the matter of flexibility of service requirements—of a steamboat having burned at a dock in Cleveland. The boat sank and it was going to require pumping out of very substantial quantities of water 1410 to make it again serviceable. The installation of permanent equipment, transformers and lines was obviously not to be recommended, and the company in this case installed portable equipment on trucks amounting virtually to a mobile substation, the cost of which was much reduced to the consumer, and the pumping job was done and the equipment returned to the company's stockrooms.

In general, the opportunities for creating good will in the handling of service problems of this character is very

—788—

great, and the company makes every attempt to realize all of the advantages of giving such service at reasonable cost, because doing so results in very definite improvement in the good will of the customer toward the company.

Q. Do you have a consumers' accounting organization? A. Yes. In connection with this vast service job, there is required a very extensive consumers' accounting organization. Part of the duty of the consumers' service organization is the reading of meters on consumers' premises, the results of which are turned over to the accounting department for 1412 billing. The consumers' service organization also works closely with the consumers' accounting organization in these matters of service complaint involving bills, and more especially in these matters of inspection of abnormally high or abnormally low bills.

Q. What are the functions of the accounting organization? A. The functions of the accounting organization are to prepare bills and accounting forms, to render these consumers' bills, to report balances usually on delinquent accounts, and to maintain the records, to provide for the investigation of abnormal bills, through the service depart- 1413 ment, to furnish such information as is required, and to compile statistical information.

These functions are performed in the routine operation of the department in connection with the four fundamental

objectives which are assigned to this department. They, too, have a function of maintaining good consumer relations by serving the consumer speedily and efficiently. They are further required in their normal function to render these bills

1414 *Elmer L. Lindseth—By Respondents—Direct*

under the proper rate schedules without error and as soon as feasible after the reading of these meters on the consumers' premises.

They have the definite objective of maintaining accurate current records available for very quick reference on inquiry from the customer, and they have to accomplish these jobs at low cost to the company, and of course indirectly to the consumer.

1415 This effort of consumer accounting requires 154 employees at an annual expenditure of $250,000. Through the efforts of this department, about 4,000,000 bills per year are prepared by the several methods employed, whether mechanically or manually. Almost 200,000 requests for information on consumers' accounts are answered, and more than 45,000 abnormal bill investigation requests are prepared.

It is thus seen that the efforts of this department are a substantial effort in the company's operations, and one of very considerable importance.

1416 Q. Does this department handle the steam billing as well as the electric energy? A. Yes. The number of steam customers is slightly more than 600. The billing for the steam

customers is handled by the customers' accounting division who prepare about 6,000 steam bills per year.

Q. What are the subdivisions of the accounting organization? A. In order to perform these numerous jobs in a manner economical and efficient, the organization is divided into a number of functional groups, 11 in fact. One of them is the addressing and bill printing group which maintains the files of the addresses, prepares the bills, that is the

printed bill in advance of having the consumers' billing information put thereon.

A second group, the meter auditing group, which records changes in meter reading, audits the subtractions made by the meter readers and prepares the reports on the abnormal consumption. These are the auditors.

Third, there is a billing group for the residential and small commercial accounts which prepares and approves the actual bill.

1418

Fourth is a ledger group maintaining the records of these accounts and posts the cash payments and the revenues.

There is a large commercial account group which as its name suggests, takes the responsibility for large commercial accounts, a special ledger group handling special accounts, a cash sorting group which posts the cash stubs representing payments, sorts the stubs for posting and similar

duties.

There is a meter deposit group, and an uncollectible account group maintaining records on meter deposits and final accounts. 1419

A customers' information group is a very important group which handles direct inquiries from customers in regard to their accounts.

A branch office group, which handles the billing relations as between the main office and the branch offices in which meter reading and billing is prepared.

Then, lastly, a miscellaneous group, maintaining controlling accounts on the customers' groups and certain miscellaneous functions.

1420 The organization of a department of this character is quite complex. The number of special situations arising is really quite large. Even though the bulk of the duties are, of course, quite routine, the handling of 4,000,000 bills is of course a production job.

Q. Necessarily, they have to be turned out very rapidly? A. Yes. It is a distinct inconvenience to the company to have delay between the time of meter reading and the time that the bill is rendered. It is an unnecessary delay, and
1421 one which with an efficient and well-trained organization can be reduced to a very short time.

The Examiner: We will take a short recess at this point.

(Short recess taken).

The Examiner: You may proceed.

By Mr. Hamilton:

1422 Q. What are the principal service problems encountered by the consumers accounting organization? A. One of the principal problems encountered in connection with the prompt rendering of bills is that of locked premises to which the meter reader can not gain access. These meter reading schedules are built up far in advance to equalize as evenly as possible throughout the year, the number of days billed in a given monthly bill.

For example, if the period covered by two or more subsequent meter readings were to fluctuate widely, the bill

would fluctuate even though the average rate as which the energy was used had remained constant.

Now, in many instances, when the meter is installed indoors, the meter reader arrives at the premises and finds them locked. The housewife is away. When this condition is multiplied by the many thousand times that it occurs on the system, a problem of some considerable magnitude ensues.

Expense goes up in proportion. Sometime ago it was the policy of the company, in connection with such circumstances to make three independent calls on the premises if necessary 1424
each month in order to read meters. If these premises were then locked on each of six successive calls, letters were written asking the customer for a definite appointment to be on

—793—

the premises so that the meters could be read.

This method, however, was quite too expensive. The next development in the handling of the problem of locked premises was by the use of postcards with dials printed on them, similar in appearance and form to the dials pictured on an electric meter face, and the cards bore the message requesting the customer to look at his meter, draw the position of 1425
the dial hands on the postcard and the meter would be read in absentia in the office.

These were then mailed to the customer and had return address to be returned to the company's office. A reasonably high percentage of these cards were returned, about 60 per cent., but a third of them returned were of no use. Surprisingly, many of the customers had read the gas meters instead of the electric meters. Many of them had the dial hands in obviously incorrect positions. In some instances, the card was not returned but letters were directed to the

1426 *Elmer L. Lindseth—By Respondents—Direct*

Company in which the customer refused to work for the Company without compensation.

It was obvious, after an experimental period, that this method just wasn't the answer. In 1927, following a long period of experimentation with these and other methods, outdoor meter installation boxes were designed by the Company's service department and transfer of meters was begun from inside to outside the premises.

—794—

1427 Considerable progress has been made since that time in moving meters, and wherever possible now, all new installations are provided with outside meters and at a time of change in occupancy of a building, when it is feasible to do so, a meter is changed from indoors to outdoors.

As a result of this program, now, about 60 per cent. of the meters of the company's residential customers are outside the premises. For those meters still not installed outdoors, the practice is this: If the premises are found locked on the first call, no follow-up is made until the regular meter
1428 reading date one month later. If the premises are again found locked the second time, arrangements are made for one of the Company's special turn-on and turn-off crews, who would be working in that neighborhood, to get the meter reading. If the premises are then still locked, the account is turned over to a special investigator who makes every effort to locate the customer and if he locates him, suggests the transfer of the meter from inside to outside.

Ultimately, it is expected that meters will, all of them, be located outside and it is to this end that the Company's program is directed.

Q. Does the rendering of these bills necessitate the use of highly specialized machinery? A. Yes. This is a highly specialized operation in which opportunities for machine production are realized. For example, in the preparation of

—795—

these bills, blank paper or blank bill stock is fed into machines from which there are obtained the printed bill in four parts. One is the bill to be mailed to the customer, a second part is the duplicate to be retained by the Company, a third part is a collection record, and a fourth part is an 1430 office or a ledger record.

The printing of these—and they are printed on both sides—is accomplished in this bill printing machine, and during the operation of printing the blank form on which the billing is to be done, the customer's address is printed with his meter number, the ledger control data, and the type of account, by symbol.

This, then, is turned over to the billing machine operators on which the data are entered and the subtractions and the calculations made. In addition to the printing of just the bill form, opportunity is also taken to present a sales 1431 message to the consumer, and each month there is printed on the blank bill form a sales plug in the form of a message on the desirability of certain types of appliances or better light, better sight, or the opportunities of cooking electrically, and similar messages.

The opportunity is a valuable one, for the message goes to the customer twelve times a year and is taken advantage of by the advertising in the sales department. In the cal-

—796—

culation of this bill, the data as indicated from the meter

reader's book is placed on the bill. The subtractions are made, the bill computed in accordance with the account classification and the schedule under which the customer is to be billed, the machine—this is done on a billing machine. The machine cuts the bill to size, scores it so that the cash stub portion of the bill can easily be removed by the customer for enclosing it with his check and the complete cycle performed by the machine.

Addressograph stencils are kept for all meters, whether
1433 they are actually in service or not. That is, the billing is primarily tied to an address rather than the name of a consumer and if there is installed in a house a meter bearing a certain number, that meter carries an Addressograph stencil in the record files, even though there be no tenant in the house. The name of the tenant is then missing, removed from the Addressograph stencil and when that Addressograph stencil goes through the machine, no bill is prepared for that meter because of the vacant premises.

Statistics show that in metropolitan Cleveland, all the customers move on an average of every three and a half years.
1434 This gives some idea of the job involved in changing the meter records, the number of such changes required per year being about a hundred thousand for changes of address within the territory.

—797—

This requires continual change in the files of these Addressograph stencils from which the bills are rendered, and the meter reading and the files are so synchronized that the Addressograph stencils are changed on the very day that the meter reading is done in order that bills are not prepared for accounts which are not read, and vice versa.

1435

Q. You say a hundred thousand? You mean a hundred thousand annually? A. Yes, a hundred thousand annually. Simultaneously with the printing of the bill to be mailed to the consumer, the machine also does the totalizing by printing on a tape the necessary information including the type of account, the number of kilowatt hours billed, the revenue billed, and the rate schedule on which it is billed, so that at the conclusion of the run of these bills through the billing machine, there may be taken off from the totalizing tape the number of bills which have been billed for 1436 that group under each account and the other statistical data which are valuable and necessary to the company.

The operators of these machines produce bills at the rate of over 300 per hour and good operators produce as many as 1,600 bills without making any mistake which requires a reprinting of a new bill. The average among good operators is to produce four thousand bills—that represents some thirteen working hours—before making a single mistake which

—798—

the operator, herself, does not detect.

1437

Mr. Hamilton: Off the record for a moment.

(Discussion off the record.)

Mr. Hamilton: On the record again,

By Mr. Hamilton:

Q. Where is your consumers accounting organization located? A. The consumers accounting organization and all of the necessary mechanical bill calculating machines are located in the central office in Cleveland. In the branch

offices, incidental work is done in connection with meter reading and the manual preparation of bills, but meter reading books from these districts are sent into the Cleveland office for calculation of the consumers bill, and the bills returned to the territory.

Q. You mentioned some of the service problems arising out of the conduct of this accounting organization. Are there others which you haven't mentioned? A. There are a very substantial number of special problems arising out of this
1439 function of billing. For example, real estate interests who may own properties in various portions of the city, the reading dates for which are diverse, like to have that bill rendered for all of the premises as of the same date, say on the first of the month.

This requires special treatment, because billing is normally done every day in the month, or at least every work-

ing day in the month, when consumers bills are sent out one or two days after the meter is read.

The retaining of such special accounts and contacts is
1440 a troublesome problem, an inconvenience to the company and requires an amount of effort out of all proportion to the convenience which results to the customer. Certain governmental agencies require that bills be certified and rendered in duplicate or triplicate or quadruplicate. This, too, requires special forms and special handling.

Some customers request that their meters be read on certain stated days. For example, the lady of the house is to be home only on a certain day and asks that the meter be read on just that day. Such out-of-routine requirements make for confusion.

1441

Not infrequently, payment is received with no identification of the consumer from whom it comes. A postal money order will be received, checks will be received with either inadequate identification or no identification and this causes quite an inconvenience to the Company in the event the consumer isn't identified.

It is obviously a nasty problem because the customer has conscientiously paid his bill, but the company just doesn't know it.

1442

Q. You meet these requests, do you, for specific days for meter reading? A. Well, within the ability of the company

—800—

to do so, yes. Consumer relations are very important in a business such as ours and rather extreme inconvenience is suffered by the company in order to meet the requirements of its customers. This is a very important function of the company; it is a very substantial item of expense.

The cost of preparing the bill, without delivery of that bill but just the preparation of that bill, amounts to six cents per bill rendered or a cost of 70 cents per year per consumer.

1443

Q. Includes the cost of reading the meter, too? A. No, that is the cost only of consumers accounting.

Q. You maintain a credit and collection division? A. Yes, this, too, is an important public relations contact department of the company since the habits of people, being what they are, require that rather substantial collection efforts be given to getting the revenue in as income.

The Collection Department of the Company has half as great a number of employees as the consumers accounting department, requires 74 employees and has an annual ex-

1444 *Elmer L. Lindseth—By Respondents—Direct*

pense, including uncollectable accounts, of $300,000.00 per year.

Q. What are the other functions of this division? A. The credit division of the Company handles not only the collection of delinquent accounts, and the number of such contacts is about 45,000 per month, or more than 530,000

—801—

delinquent accounts per year, but in addition, handles credit investigation of new accounts in a number reaching 15,000

1445 per year, and complaints which reach 4,000 in number.

The contacts of this department with the public then aggregate more than 100,000 contacts with customers per month, since in the handling of those delinquent accounts sometimes two and three calls are required. These 106,000 contacts per month are made up of about 10,000 office contacts, 29,000 contacts per month average by mail, including collection notices mailed and about 60,000 collector contacts per month where the collector visits the customer on the premises, and some 6,000 telephone contacts.

The aggregate of all of these is more than a million and

1446 a quarter contacts between the Company and its customers through the credit and collection department, an opportunity to incur goodwill through doing a good job or distinctly ill-will through poorly handling the job.

Q. Is the maintenance of this division an expensive item from the standpoint of operating expense? A. Based on the results, the Collection Department has done a very satisfactory job. The credit losses resulting from this activity amounted last year to but one-sixth of one per cent. That is, uncollectable accounts written off amounted to less than $50,000.00 in a gross revenue of $29,000,000.00. The index

of the effectiveness of the collection policies of the Company

—802—

may be measured by a ratio described as the "collection percentage" which is the ratio between the amount of money collected in a month and the amount of accounts receivable at the beginning of the month. That ratio for 1939 was 97 per cent.

That is, the ratio between the average month's income collected to the accounts receivable was 97 per cent. From this may be computed the so-called collection lag or the 1448 average length of time between billing and receipt of the collection.

There is neither discount for prompt payment, nor penalty for delayed payment in the rate structure of the Company and as a result there is no particular saving incentive on the part of the customer to make prompt payment of his bill.

In the matter of specific costs, in 1939 I have referred to the figure of uncollectables, which I incorrectly stated to be slightly less than $50,000.00. In reality it was slightly more than $50,000.00, being $51,000.00

The average uncollectables over the last five years has 1449 been almost exactly $50,000.00, and within narrow limits remains unchanged.

The average cost of bill delivery, collection through cashiers and agents, operation of the collection department, and the uncollectable accounts, totals about $375,000.00 per year or a combined expense per customer of about $1.15 per

—803—

year per customer for bill delivery and collection. When related to dollars of revenue, this becomes about one and a quarter cents for the unit collection cost per dollar of revenue.

1450 Q. What are the principal objectives of this division? A. This division again, being a customer's contact division, has the fundamental objective of gaining and holding the goodwill of the customer and the community through the application of a liberal common sense credit collection and adjustment policy.

It is, of course, the duty of the company to collect for the service it renders to its consumers, in order that those who do pay promptly may get their service at reasonable
1451 cost. Secondly, the credit department is charged with the responsibility of turning over the accounts receivable of the company in the shortest possible time and to accomplish these foregoing two objectives with low cost to the company and at reasonable or low uncollectable account losses.

Q. In its operations, does the division require any cooperation of other divisions of the company's staff? A. Yes, the meter division of the service department works quite close with the credit and collection division. All preliminary work up to the point of actually turning off service for non-payment, is done by the credit and collection division. How-
1452 ever, if the means of this credit and collection division have

been exhausted and the meter is scheduled for disconnection as a result of non-payment, it is the meter division employees who are responsible for such disconnection. These meter division employees are, however, authorized to make collections as an alternative to cutting off service and in many cases, of course, do make such collections.

Now, in performing these collection functions, this credit and collection division section, to minimize its ultimate job by commencing with the credit investigation of the new

1453

customers, one of the first functions of this division is to pass on the credit of new customers. It collects these past due accounts, deals with complaints, arranges settlements for unmetered service—unmetered service usually being stolen service through tampered meters. It conducts all correspondence and other contacts with consumers, and it supervises collection agencies which are located throughout the Company's territory, to whom consumers may pay their bills in lieu of payment to a branch office of the company.

1454

Q. What are the subdivisions within the organization's credit and collection division? A. Well, the credit and collection group is organized functionally as is the consumers accounting group, and embraces a general group which supervises the operations of the division, collects large accounts and handles the relations with these collection agents.

—805—

There is a group of interviewers, a public contact group, who actually contact the public. There is a collection group on active accounts—that is, customers who have not moved or discontinued service—a collection group on final accounts for customers who have left the company's lines, and then

1455

a branch office group which correlates the activities of the collection division in Cleveland with the efforts in these various branch offices.

In performing these functions, the Company's policy is to minimize red tape required incidental to opening an account, and application for service may be made by telephone or mail without at all requiring, on the part of a residential consumer, that he make a personal call at any office of the company, or sign any application, for residential service. Neither is there any deposit required or other security ex-

cept in the case of transients or other persons with uncertain sources of income.

Q. How do you determine into what category the residential consumer falls? A. When a residential applicant calls up or writes in or makes in person a request for service, the credit clerks determine whether a deposit shall be required by getting from the applicant his name, his address at which he wants service, his former address where he had formerly been a Company customer, and his business con-
1457 nection. Based on these facts, if his credit record has been

good at his former location, his credit record will be good at his new location. If he is unable to give such credit data as are required to establish what his credit situation is or will be, then a deposit is required.

Commercial customers, however, because the hazard or possibility of a bad debt loss is greater than that of residential customers, are scrutinized more closely for their credit. The applicant's personal record of his assets and his experience and the nature of his business are considered and
1458 if, after the consideration of these factors, it is felt that a deposit is required, such deposit is made.

Signed applications are required from all applicants for commercial service, although they are not required for residential service.

Furthermore, in the handling of the collection of accounts, all consumers are not treated alike. That is, the collection policy of the company is to endeavor to give due consideration to the fact that some customers, although financially responsible, and able and willing to pay, inadvertently fail to remit—they forget or mislay the bill.

1459

A second class of customers are those who, while responsible, have the habit of putting off payment until urged by the company to do so.

A third consideration is a group of customers who are

—807—

honestly trying to meet their obligations in the face of discouraging difficulties; and a fourth group who are irresponsible, poor or incapable of managing their personal affairs and paid only when forced to do so.

1460

Many accounts are eliminated from collection work because the amount of the delinquency is too small to warrant a collection effort. For example, it is the Company's general practice to withhold from collection work all residential accounts on which the consumer owes for only one month's service and any account, whether it be a residential or a commercial account, if the amount due thereon is less than $5.00. That is, if a consumre's account be at the rate of a dollar per month, no collection effort is made until the delinquency reaches $5.00 which might be five months of service.

1461

If, during collection activity, a bill which had been, for example, $8.00, is reduced by a payment of $4.00, collection effort ceases on the remaining $4.00 until the delinquency again reaches $5.00; or, if regardless of the size of the delinquency, the customer pays more than one-half of his account, further collection action in that monthly cycle is stopped.

Action on those accounts, which, however, are scheduled for collection, commences two days after the due date of the account and this due date is about ten days after the mailing

date. After collection starts, there is a five-day interval be-

—808—

tween the successive steps in the collection.

In order to differentiate between customers, based on their paying record, accounts are classified and designated in the credit department in accordance with the following designation: An "A" account is an old customer who rarely, if ever, is delinquent. Action on such a customer is taken only at the discretion of the sectional collection supervisor.

1463 A "B" account is an account of an old customer who is occasionally delinquent and collection procedure here is to make two preliminary contacts, either by mail or by a collector as the first two steps. Then there is sent a cut-off notice by mail. If payment is then not yet arranged, a cut-off collector is sent, who acquaints the customer with the fact that if the delinquency is not made up, service will have to be cut off.

A "C" account is a customer who is frequently delinquent and habitually is in arrears and is paying on account. For such a class, there is one preliminary contact by a collector.

1464 Then a cut-off notice by a collector, and the third step is the sending of the cut-off collector.

A fourth class of accounts is the so-called "N" account which is that of a new customer who takes the same collection procedure as an old customer who is just occasionally delinquent.

—809—

No charge is made for the reconnection of a customer whose service has been cut off for non-payment. Prior to the depression—or the most troublesome period in the depres-

sion, in 1933—a collection charge of a dollar was made for restoring service which had been cut off for non-payment. This, however, worked some genuine hardship on customers who were quite unable to pay during the depression, and during that period, the re-connection charge was abandoned.

At the time of a request to be reconnected, after disconnection, the customer almost invariably comes into the office of his own volition and is then interviewed by the public contact group in this division. Effort is made to collect the full amount of the past due account before reconnecting the 1466
service, but the full story of the customer's circumstances is obtained and where these circumstances warrant, satisfactory arrangements for the completion of the payment of the old account are made and service is turned on on payment of less than the full amount of the old account.

About 60 per cent. of the reconnections after cut-off are thus made with less than full payment, and the average percentage of payment before service is restored averages about 50 per cent.

On payment of this portion of the old account, the only other requisite for restoring service is that satisfactory ar- 1467
rangements be made for completing the payment of the old

account.

The major service problem in this collection division is to make available to the consumer, convenient sources through which the company may receive the revenue, and the customer may make his payments. To accomplish this ease of payment, the company makes available to the customers throughout the territory payment opportunities through

so-called bill collection agencies. These bill collection agencies are eighty-five banks in the territory where at no charge to the consumer he may pay his bill, and thirty-one other agencies, other than the nine company offices, and these other agencies in territories where there are neither branch banks nor company offices may be merchants in the territory such as the grocer, or other accredited individuals to whom the consumer may pay his bill.

The aggregate number of bills paid by check to the com-
1469 pany offices by mail is not the large portion of the bills collected by the company. These bill collection agencies are distributed throughout the company's territory to insure adequacy of service to all customers with minimum of inconvenience.

Q. Does your so-called local representative handle this aspect of the work, too? A. Yes, the local representative is an accredited collector as well as a meter reader or a complaint investigator.

—811—

Q. Previously, in your testimony, you spoke of other
1470 facilities owned by the company, quite apart from the generating stations, distribution lines, and transmission lines. Would you state the function which that property owned by the Company serves in the Company's operation? A. In the operation of this miscellaneous general-purpose equipment, operation of the shops and garages, there is a very substantial personnel required and a very substantial operating organization.

For example, at the garages of the company alone, there are required the services of 126 men who are charged with car inspections, painting, overhauling, and similar duties in

connection with the substantial fleet of trucks and cars. The Company's fleet of transportation equipment travels five million miles a year, uses five hundred thousand gallons of gasoline—or very nearly so—and is a very substantial problem in the company's operation.

A part of this division is the so-called transportation department, itself, which provides transportation service for the routine and emergency movement of materials. The transportation department operates twenty-three vehicles and is available on request from any department of the com- 1472
pany to transport equipment or supplies or materials wherever required. The number of jobs handled in a year is 11,000, and of these transportation jobs, 98 per cent. of the

—812—

calls are completed on or before the scheduled time.

Transportation trucks are located in garages adjacent to warehouses in order to expedite obtaining materials and the loading of such equipment. Requests for moving material are telephoned to a schedule clerk or a schedule desk; the driver is given his order by telephone and the job is started.

In emergencies, the importance of such a transportation 1473
department is well realized. For example just two months ago, in June of this year, a particularly localized wind and rain storm broke off seven consecutive poles in a feeder line serving a small village in the suburbs of Cleveland. It involved the supply to the transmission station of a major radio broadcasting company and the village pumping station. The trouble department, of course, was promptly on the job, but was handicapped for lack of equipment because obviously a mobile trouble crew does not carry with it seven poles. However, the transportation department, on checking routine job

orders on file, found that there was loaded at one of the locations, a trailer for the delivery the next morning of the same size poles to another job.

This equipment was redispatched to the affected area, the material delivered, service restored, and the equipment returned in four hours.

This is, of course, an outstanding case of the opportunity of transportation equipment to reduce duration of

—813—

1475 outage in the event of emergency, but is characteristic of the class of service required of them and experienced by them.

Q. Now, you have various shops which are in operation. What are they? A. In connection with the very substantial amount of construction work performed by the company, there are also operated shops.

For example, a shop is required for the inspection, adjustment, testing and repair of transformers, and the transformer repair department performs such operations on as many as 4,000 transformers per year which have been removed from the Company's lines.

1476 This shop also inspects and tests approximately 2,000 new transformers per year, and it is, in general, the policy of the company to replace transformers on the pole rather than to make any emergency repairs except under extraordinary conditions, on the pole.

Such a removed transformer is then sent to the shop, is checked, reconditioned, and returned to the stockroom.

Another similar shop is the cable shop, where reclaimed cable is handled. Cable, after being removed from the ground, whether because it has been displaced by cable of another

size or because a portion of the cable has failed, or for whatever other reason, is sent to the cable shop, where it is

—814—

inspected, where the defective portions are removed and the good portions of the cable respliced into longer lengths for reuse.

This operation has been particularly beneficial to the Company. There go through this cable shop some 150,000 feet of used cable per year, and of this amount about 60 per cent. is reclaimed for re-use, and the balance is scrapped. 1478 About 65 per cent. of this salvaged cable is spliced into lengths up to as much as a thousand feet for re-use. The rest of the cable is returned to stock without splicing.

Transmission wire, both bare and insulated, is also inspected in the same division and about 70,000 feet per year is passed through this shop. Substantial savings are realized in the reclaiming of cable which amount to as high as a dollar per foot.

Q. Where are these shops located? A. The shops are located at several points throughout the Company's territory. The two major shops are located in the Cleveland district at 1479 Miles location in Cleveland and at Brooklyn. Those are the two major shops of the company.

In addition to the shop functions which I have described, there is an additional special equipment shop maintained to service the numerous items of specialized construction equipment, such as trenching machinery, concrete mixers, cranes, pole setting equipment, air compressors, pumps and the like,

—815—

and there is in addition a tool repair shop to handle the numerous tools required by the Company in the construction

and maintenance of the system. In the tool repair shop, not only is maintenance work done, but certain items of construction materials are either reclaimed or originally built.

For example, street lighting brackets are made in the tool repair shop, cable racks are made, ladders are built for underground manholes. The outdoor meter case assemblies, which I described in connection with the transfer of metering equipment from indoor to outdoor locations, are made or assembled in this shop.

1481 This shop builds special laboratory equipment. For example, when the research laboratory was recently in need of some highly specialized equipment not available in the market, such equipment being able to be obtained only by construction in accordance with specialized drawings, the equipment was built in the Company's own shop.

Q. Do you have warehouses among your properties? A. Yes.

Q. What purpose do they serve? A. The warehouses on the property are the locations at which these numerous items of emergency repair materials and routine construction and

1482 operating materials are maintained.

The stores department operates as a single unified depart-

—816—

ment throughout the system, and it operates eighteen units, comprising a central stores office, five main warehouses, five sub-storerooms, four plant storerooms, two garage storerooms and one pole-processing yard.

Q. Does this particular phase of the operations require employment of a substantial number of men? A. The stores department has in the aggregate a hundred employees. 22,000 items of material are stocked. The average value of the in-

ventory of materials is about $2,400,000.00. In an average year about 620,000 items are handled in all stock dispensing transactions, and the average value of such materials handled in a year is estimated at $2,000,000.00. Six hundred carloads of material are required in a year. Eleven hundred tons of scrap are handled.

In addition to the storage functions, this division handles the processing or the creosoting of 7,000 poles and 23,000 cross-arms—a very substantial effort.

Q. What is the nature of the material stored? Is it made 1484
up of wire and supplies necessary for lines? What would be the general description of it? A. The 22,000 items naturally cover a very wide range of materials and parts. The number of specific types of materials is obviously a small part of the aggregate of 22,000 items. By far the greatest number of items are specialized maintenance parts except for numerous items of equipment such as oil switches, re-

lays, or in the power plants the turbines, the boilers, the pumps, and for the line department such devices as insulators, disconnects and the like. 1485

A substantial amount of the material, however, is in the form of wire, cables, pole-line hardware, bolts, brackets, cross-arms, pins, tie-wires, and similar items.

Q. Are the warehouses you have spoken of distributed over the territory served? A. Yes. These warehouses are distributed for maximum convenience of the operating and maintenance personnel in order that the time required to get equipment and materials to areas affected by service outage will be kept to a minimum, and it may be said that on the system map, Exhibit 21, that such warehouses are

1486 *Elmer L. Lindseth—By Respondents—Direct*

distributed throughout the territory—one being located, for example, at Conneaut in the extreme eastern portion of the territory; the next one at Ashtabula, south of Ashtabula, at Jefferson; another at Geneva; yet another at Mentor, Chardon, Chagrin Falls. Then, moving into Cleveland and suburbs, the rest of these storerooms are located in Cuyahoga County with the exception of one maintained at the extreme western end of the system at Avon.

Q. And that distribution is necessary to the efficient
1487 operation of the system? A. Yes.

Q. Are there any particular objectives of this division
—818—
of the Company's operations other than those which you have mentioned? A. The principal objectives in the operation of an incidental department of this character, where contact with the public is indirect, is that the service to the company's trouble, construction and maintenance forces be adequate to permit these forces to render the necessary service, and that such warehouse efforts be carried on economically and with adequate safety to the Company personnel.

1488 The number of items should be kept to a reasonable minimum. As a result of the effort to keep this number of items at a reasonable but adequate minimum, the number of items carried by the stores department of the Company has been reduced from about 25,000 to about 22,000 at the present time. This has been accomplished by working off dead stocks, standardizing sizes, and a more careful scrutiny of items formerly put in stock from removal jobs where in too many cases material which was just junk was being saved and maintained in a stock.

The stores department discourages the use of white elephants carried in stock, odd sizes, miscellaneous specifications of material, in its constant effort to keep reduced to a minimum types, sizes, styles and the like.

The material carried is carried under two requirements as to quantity maintained on hand. First, that the quantity

—819—

be adequate to take care of routine requirements for construction and normal maintenance; but second, that the quantity be adequate to take care of these very infrequent 1490 major emergencies that require very abnormal amounts of construction material.

So that minimum supplies on hand are usually dictated by emergency, and there are fixed for each class of property —that is, each size of pole, each size of wire, each size of cable—minimum quantities permitted to be carried as estimated from the emergency requirements which result from very major disturbances in the community.

Mr. Hamilton: I think, Mr. Examiner, that again represents a convenient breaking point. 1491

The Examiner: All right, we will recess until tomorrow morning at 10:00 o'clock.

(Whereupon, at 4:35 o'clock p. m., the hearing was recessed until 10:00 o'clock a. m., August 7, 1940.)

1495

PROCEEDINGS

The Examiner: The hearing will come to order. Due to counsel for both sides wanting to be present at another hearing we are starting a little late and I thought I would make that statement to explain why we did not start promptly at ten o'clock.

Whereupon ELMER L. LINDSETH resumed the stand and testified further as follows:

1496

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Lindseth, do you feel that the electric service rendered by the Cleveland Electric Illuminating Company is of high quality? A. As I have testified in the description of the physical properties, a fundamental criteria in the design of the system is that service be reliable and adequate for the consumers served. Similarly in connection with my testimony relating to the manner in which this system is operated, I have pointed out that a fundamental objective is that the service to the consumers be adequate in matters of continuity, reliability and other phases of service. The 1497
manifestations of high quality service to consumers and to the community are continuity and reliability of the electrical supply, itself.

Q. If I may interrupt, you are speaking of your own company, of course, are you not? A. Yes. Second, that

there be the necessary constancy of voltage and frequency. Third, that in the event of interruption of service that there be a reasonably prompt restoration thereof, and fourth, that there be promptness and convenience in furnishing service to new consumers, making additions to service requirements

for present consumers in the metering, in billing in general, and in the handling of all consumer service and customer relations.

Q. Has the unification, so to speak, of your electric facilities as to which you testified, provided the insurance for maintenance of this character of service? A. In my judgment only by virtue of the fact that the system is operated as an interconnected single system, unified throughout the territory in its physical properties and operating under well
1499 defined system policies of operation, has this high standard of service been able to be realized. It is the unification of the system into a single operating unit that makes possible the high state of development to which these properties have been brought.

Q. Now, would you illustrate further the theory of maintenance of good electric service by specific examples of the manner in which service is maintained?

I would like to have you refer specifically, if you will, to service interruptions. Have you any data as to the character of service interruptions? A. Although the Company's
1500 —823—
property is relatively more exposed to hazards from storm and other interruptions by virtue of the fact that more than 12,000 miles of the company's 14,000 miles of circuits are carried overhead, still even in the case of this condition the record of service interruptions is such as to yield a frequency of outage per consumer of all classes in the aggregate for the entire system which is once in five years, or the reciprocal thereof, a frequency of outage of 0.19 times per year.

This over-all figure is for the system as a whole and is the composite for all consumers. Because of the variations

in the exposure of the system to causes of outage, such as the incidents of storms, lightning and the like, this record of service reliability is not uniform throughout the territory.

For example, within the territory immediately surrounding the city of Cleveland, the territory designated in Exhibit 21 as Cleveland and suburbs, including the portion immediately to the west of Cleveland, this incidence of service outage caused by failure of the Company's facilities is but 0.05 times per year, or a frequency of outage of once in 19 years. 1502

I should make clear in connection with all of these statements relating to the frequency of consumer outage, that the frequency figures which I am giving and the corresponding duration of outage figures which I will give, are those caused by factors over which the Company assumes responsibility, namely the failure of sub-stations, the failure of the Com-

—824—

pany's primary or secondary distribution system, the failure of company-owned transformers or service wires, but do not include outage suffered by the customer from causes over which he himself, supposedly has control such as, for 1503 example, the failure of wiring within his own premises due to neglect of adequate maintenance, inadequacy and improper operation, or any of the other causes which may result in an individual customer suffering outage due to his own causes.

To resume then, and again referring to Exhibit 21, in the territory comprising the three counties in the eastern portion of the system to the right, to the east of the territory described as Cleveland and suburbs, the incidents of outage is at the rate of 1.58 times per year, or a frequency of outage per customer of once in eight months.

1504 *Elmer L. Lindseth—By Respondents—Direct*

Summarizing then, the average frequency of outage suffered by all customers on the system is once in five years. Within the area described as Cleveland and suburbs, this frequency is once in 19 years. In the area comprising the three counties in the eastern portion of the system, this frequency is once in eight months.

Q. Is the less favorable record in the eastern territory due to the larger presence of overhead distribution lines as distinguished from underground lines in the city of Cleve-
1505 land? A. Yes, that is fundamentally the cause for the difference in the record. It is an established principle in our

own experience and of the utility industry that the reliability of underground transmission and distribution is vastly superior to the reliability of overhead transmission and distribution. Within the city of Cleveland, because of the density of consumers and because of traffic conditions and congestion resulting, it is expedient that the transmission and distribution facilities be largely installed underground. The cost thereof is very materially greater than overhead con-
1506 struction, often being in the ratio of ten to one in the cost of underground as against overhead for corresponding facilities.

In order that service may be extended to sparsely settled communities and rural areas at any reasonable cost to the consumer at all, it becomes necessary that there be some sacrifice of service continuity and reliability through the use of over-head distribution and transmission facilities. Lacking these, the economics makes the rendering of service to those consumers at all prohibitive.

1507

Q. Now, I believe that you testified that the average outage of the system was of the order of 45 minutes in length. Is that figure constant throughout the system or, here again, is there a difference between the eastern section and Cleveland proper? A. There is such a difference. Within the city of Cleveland, or more properly within the area described on the map as Cleveland and suburbs, the average duration

of outage suffered by this customer who experiences an outage of once in 19 years, that duration is 39 minutes, based on 1508
the experience of the Company as of the year 1938.

In other portions of the system described as the three eastern counties of the system, the corresponding duration of outage which there is experienced once in eight months, is 47 minutes. The composite average for the entire system then made up of the section described as Cleveland and suburbs, and the three eastern counties, becomes a 44.85 minutes to which I have been referring as 45 minutes.

Q. When did you last experience a shut-down in your main transmission system? A. A complete shut-down at the main transmission system as it exists today has never 1509
occurred, yet in the period substantially before the system had reached its present state of development and size there was a complete curtailment of service due to shut-down of the main transmission system occasioned by the failure, electrical failure, in the Lake Shore switch house.

This occurred more than 16 years ago, June 22, 1924, and resulted from a short circuit on a feeder bus in switch station "A" at the Lake Shore plant. This was, however, prior to the construction of the Avon and Ashtabula plants,

1510 *Elmer L. Lindseth—By Respondents—Direct*

prior to the completion of the interconnecting high voltage transmission system, and it may reasonably be concluded that under the present plan of design and operation as an

—827—

interconnected system of several power plants, such a complete failure could not again occur.

Q. I suppose it is obvious that trouble occurring from time to time on portions of the transmission line do not cause interruptions of service. Is that a correct statement?

1511 A. Yes. Under the principles of design which I have described whereunder, for example, a continuity of service is not impaired in the event of the loss, for example, of one transmission line, one generator in a power plant, one boiler in a power plant, there may and there have occurred major interruptions of the service of units of equipment without there occurring corresponding loss in service to any customer.

For example, in the last 16 years there have occurred 247 cases of trouble on the Company's circuits, which have been of such severity as to justify special reports and analy-

1512 ses by the electrical department of the company. Analysis of these reports indicates that more than half of these major losses of equipment have caused no interruptions to the transmission or distribution of power resulting in service outage to any consumers. The remainder of these interruptions have caused the outage of certain service areas.

Analysis of the statistics which I have recited in the duration of outage by cause, and analysis further recognizing the frequency with which such outage occurs per year, reveals that the average annual outage per customer from

causes over which the Company assumes responsibility, is

—828—

8.54 minutes. That is, although the individual outages of service on the system have a duration of about 45 minutes, the frequency with which they occur is such that the average outage experienced per customer is but 8.54 minutes per year.

Here, again, the duration of such outage in the several parts of the system is not identical. In the portion of the area described as Cleveland and suburbs, the average duration of outage per customer per year is but 2.17 minutes. 1514
That is a customer in the area experiences an outage of but once in 19 years. The duration of such outage is 39 minutes, so that the average customer outage per year is but 2.1 minutes.

In the territory described as the eastern three counties, however, where the frequency of outage is once in eight months, and where the duration of that outage is 47 minutes, the average outage experienced per customer per year becomes 73.94 minutes, or substantially 74 minutes. The make-up, or better perhaps the segregation of this outage into the 1515
time by causes, shows that within the Cleveland area described as Cleveland and suburbs, the aggregate outage of 2.17 minutes is caused by an outage of .14 minutes per year per customer due to the failure of the sub-station supply, itself. Of the total time 1.87 minutes is caused by failure of the feeder or the primary system between the sub-station and the consumer.

The third portion of the total outage is due to failure of

—829—

the transformer, itself, and is responsible for .15 minutes of outage per year.

The fourth category, miscellaneous, is responsible for .01 minutes per year.

The corresponding figures for the three counties comprising the eastern portion of the system, reveal the effect I have described of the susceptibility of overhead transmission and distribution to outage caused by lightning and windstorm. For example, the average customer in this territory suffers
1517 an outage due to failure of the sub-station or its supply, which amounts to 15.59 minutes per year.

This is in large measure caused by storm damage to the 33,000 volt sub-transmission system supplying the sub-stations in the area.

The second cause of outage to such customers—the outage due to the distribution primary feeders—amounts to 58 minutes per customer per year.

The resulting transformer outage, a third class of failure, is .33 minutes per year, and the miscellaneous group .02.

This summarizes, then, the causes of consumer outage in
1518 the several portions of the system, and the relative effect of each of the several causes.

Q. I believe you spoke yesterday about an interruption to your 132 kv. line, due to the dynamiting of a tower. Have you had other instances of a simliarly unusual nature involving the high line? A. Yes, we have had such. In

spite of the highest standards of design and construction, circumstances arise quite out of control of the Company against which it is virtually powerless to protect itself in insuring continuity of supply to its consumers.

1519

For example, the high voltage transmission system, intercomnecting the main power plants of the Company, had a major interruption of service at a point shown on the map as Northfield switching station designated by the symbol NF in the southern portion in the Cleveland and suburban area.

Q. This is Exhibit No. 21? A. Yes, Exhibit 21.

In 1928, when this line was a single tower two-circuit line, an airplane making a forced landing crashed into the two transmission lines at this point and severed both of the lower or "C"-phase wires.

1520

This, of course, interrupted service on the line and at the time, the Ashtabula plant was not yet built and substantially all of the eastern portion of the system depended on the flow of energy through either this 132,000 volt transmission system or a 33,000 volt connection at Sanborn Station designated SN in the vicinity of Ashtabula.

The outage occurred at 2:41 in the afternoon. Service was able to be restored fifteen minutes later at 2:56 by

—831—

1521

switching the load which had normally been carried on the 132 kv. system to the 33 kv. system through another path. The accident occurred on Sunday afternoon, when load conditions were light, although traffic conditions in the vicinity of the failure and the presence of a traction line and another 33,000 volt line belonging to the traction company, rather complicated the maintenance operation.

By emergency repairs making a single circuit out of the two circuits remaining by the use of certain of the "B"-phase wires as jumpers, service was temporarily restored on

1522 the transmission system at 8:43 that night and normal service restored the next day.

Q. In that same area you now have a double steel tower four-circuit line? A. Yes, as a result of load growth in the area, as a result of the construction of the Ashtabula plant and the interconnection of the plants to a single system, those facilities have been increased from two circuits to four circuits.

1523 Q. What are the Company's standards of frequency control? A. I have mentioned that in addition to the continuity of supply, the quality of that supply is an important criterion as to the adequacy of service.

One of the characteristics which may be described as the quality of the electric current is the constancy of the fre-

—832—

quency. Maintenance of standard frequency is a desirable characteristic on a system such as this in order that the time control of electric clocks, for example, may be reasonably exact.

1524 If the frequency of the system which results from the generators operating at a higher than their standard speed, if that frequency is too high the clocks run too fast and gain time.

Similarly, if the frequency is too low, resulting from generators operating too slowly, the frequency is low and the clocks lose time.

In industrial plants, where precise speed control of motors is important, high frequency results in an excessive speed and correspondingly low frequency results in low speed. In certain textile operations such as the spinning of

rayon yarn, speed control becomes extremely important because fluctuations in frequency will result in variations in the diameter of the fiber or filament making up the rayon thread and correspondingly imperfect product.

Deviation of frequency from standard is measured by comparison between an electric clock operated from the system and a precision type of pendulum or other mechanical clock dissociated from the electrical system.

It is, of course, a characteristic of alternating current electric service that the frequency is absolutely the same 1526

throughout an entire interconnected system, or throughout any area in which a single frequency is imposed on the interconnected system.

Therefore, an instrument may be located at any point within the entire system to indicate the frequency at all points on the system.

The Company, in the main load dispatcher's central office, maintains precision instruments to indicate and record momentary deviations of frequency from standard and the 1527 accumulated or integrated deviation of frequency from standard. Under the standards of frequency adhered to by this Company, a frequency of sixty cycles is maintained with such precision that the normal allowable deviation of electric time from standard time does not exceed three seconds at any time.

The control of this frequency, when the system is operating apart from interconnections with any other utilities, is obtained by control of the speed of the generating equipment. In the event the system is operating as it customarily does

1528 *Elmer L. Lindseth—By Respondents—Direct*

interconnected with the electric system of an adjoining utility, then the frequency of the Cleveland Electric Illuminating Company system is precisely the frequency of the entire interconnected system to which it is connected.

Q. What are your standards of voltage control? A. The other characteristics of the quality of electric service is the constancy of voltage, and here deviations at different points

—834—

on the system are quite within the control of the Company
1529 in its design and operation.

The Company in the service of residential and small consumers supplied from an overhead or underground primary distribution system, employs two classes of feeders, so-called light feeders and so-called power feeders.

Light feeders are in general regulated as to voltage, particularly in urban areas, and the voltage is so maintained at the consumer's premises as to be within the standard deviation of plus or minus three volts from the design standard of 115.

In the case of urban areas where distances traversed are
1530 greater and where other conditions make such close regulation not feasible, the voltage standard for light feeders is plus or minus five volts from the standard of 115.

In the service of power customers fed from the primary distribution system, there are two classes of power feeders —a first class of regulated power feeders, those which have in addition to power loads a substantial percentage of lighting load thereon. These in general are in urban areas, are regulated and have a frequency maintained thereon of plus or minus three volts from standard.

There are in addition, certain other regulated power feeders in which the load is primarily power, which, if they were not regulated, would have a voltage deviation from standard which was excessive, and these have regulation

—835—

within the limits of plus or minus five volts from a nominal standard of 115.

The manifestations of poor voltage on light feeders are dimming of lights or lack of constant lighting intensity, and in the case of certain appliances such as the electric range, 1532 inadequate voltage or low voltage results in unsatisfactory performance in the form of slow operation or slow cooking.

Q. How is the voltage control maintained? A. This close maintenance of voltage control on the primary distribution of the system is largely obtained through the use of so-called induction regulators at the sub-stations, which insure through the necessary wiring circuits and other control relays and equipment, that the voltage at the consumer's premises will be able to be maintained within the limits of design established.

These, in the case of lighting feeders, are single-phase 1533 regulators, but in the case of power feeders are three-phase regulators.

There is, likewise, some voltage control realized through regulation of voltages at power plants, but in general this is an operating expediency of the Company and does not result in control of voltage at the consumer to the extent that sub-station feeder regulators do result in such voltage.

—836—

In those cases in which the Company seeks to check the effectiveness of the means employed for regulation of volt-

age, graphic or curve drawing voltmeters are installed on consumer's premises for a sufficient time to experience all of the conditions of load and based on the records revealed by such charts of curves drawn, conclusions may be reached as to the adequacy of the Company's facilities for maintaining the standards of service desired.

Q. Is it your experience that the public is prepared and does assist you in locating causes of trouble? A. Yes, the standards of service, to which I have testified, are in sub-
1535 stantial measure made possible only by the prompt and willing cooperation on the part of the consumers to report cases of trouble and otherwise to assist the Company in locating trouble.

As I have mentioned in my previous testimony, the number of calls received from customers is very substantial, requiring, in times of major system trouble, very substantial telephone facilities.

For example, in the Company's private telephone exchange, there are forty-seven incoming trunk lines handling more than two million telephone calls per year. Special
1536 lines are assigned and provide for the use of employees when reporting accidents involving personal injury or for other emergency communications.

The Company operates a teletype system, for example, between the main office in Cleveland and branch offices in certain of the cities in the eastern portion of the territory, for example, referring to Exhibit Number 21, to Mentor, Geneva, Ashtabula and Conneaut.

Q. How long does it take one of your trouble crews to clear a reported case of trouble? A. Nine out of ten calls

received by the Company reporting service outage on the part of a customer, are calls which grow out of causes over which the Company has no control. That is, they are customer-caused outage. The other ten per cent. of the calls are company-caused outage, or outage over which at least the Company has responsibility, and it is this latter class to which I have testified as to the frequency and duration.

The 90 per cent. of the calls then reporting no service arising out of trouble on consumer's premises, are handled by the Company and the service restored in an average time 1538 of twenty-five minutes.

The number of such calls is about one hundred thousand per year, so that the average customer suffers an outage from causes over which he supposedly has control at the rate of about once each three years, the duration of which outage is about twenty-five minutes, or the average outage per cus-

—838—

tomer from his own causes is about eight minutes per year.

Q. So that your control crew, your trouble crew, clears the difficulty on the average in twenty-five minutes in those 1539 instances? A. That is correct.

Q. Now, you spoke of the major difficulties in operation of transmission and distribution lines which are overhead. Do similar difficulties arise in the operation of the underground system? A. Yes, there are difficulties similar in character and in some cases similar in severity, but fortunately not with the same frequency.

For example, in the direct current, underground system supplying downtown Cleveland, fire occurred due to a short circuit in certain direct current feeders near the Bolivar

1540 *Elmer L. Lindseth—By Respondents—Direct*

Road Sub-station in 1931, which spread for three city blocks before it could be brought under control.

This point is right at the center of Cleveland, in the vicinity of the sub-station whose symbol is BV. A feeder went out of service early in the morning before 6:00 o'clock when a comparatively small number of men were on duty as a result of a short circuit.

Soon thereafter, the trouble spread and became one of major intensity and as soon as men could be called from
1541 home, one hundred maintenance men were dispatched to the job, about half of whom were working on cables and about

half of whom were required in the manholes.

Three manhole covers were blown off by the explosion following the fire. Two more were required to be removed because of smoke conditions.

The Cleveland fire department used and recharged a chemical wagon three times in an effort to extinguish the fire. The Company used its own fire-fighting equipment and
1542 water-lines were finally turned into the manholes.

The problem was then to clear the resulting damage which had resulted from the fusing of these cables from the very intensive short circuits. These had to be removed in solid blocks of fused copper, cut with acetylene torches. Temporary facilities were required to be laid on the surface of the ground by-passing the damaged sections to temporarily relieve the situation, and it was several days later before final restoration of the equipment in its normal condition was accomplished by pulling new cables through the ducts.

1543

More than eight thousand feet of 1,000,000 circular mil cable were required to be replaced, and it was by virtue of a solidly interconnected network or grid system in the underground areas for the direct current distribution that service continuity was able to be maintained at a reasonable level and the inconvenience from the disturbance minimized.

Q. You have spoken of periodic meter testing as one

instance of maintaining reliability of service. Are the meters retained on customer's premises at all times, even when the 1544
premises are unoccupied? A. Except under unusual circumstances, yes. In certain areas of the city property in vacant premises is not very well able to be protected and in certain of those extreme cases meters are required to be removed because they are stolen from vacant premises.

Fortunately, those areas are small, however, and in the aggregate for residential consumers the distribution meters are left on the premises so that the owner may, in the event the premises are to be rented, use lights at night in showing the property to prospective tenants.

1545

In commercial installations, meters are habitually removed on the moving of the tenant.

Q. In addition to the line patrol services and trouble repair services as to which you have testified, are there other precautions which are taken by the Company to insure continuity and reliability of service? A. Yes, to summarize all of these precautions required to insure dependable supply, in addition to those that I have mentioned, there are installed operating procedures designed to quickly detect any electrical disturbances which may affect service, prompt

means employed to dispatch equipment and men to the scene of disturbances, to investigate outages or interrup-

—841—

tions, to do the things which I have described as being required to promptly restore normal service, provide in the design of the system facilities to transfer load and transfer supply lines from one source to another, and in addition, to make convenient and readily available to the consumer what information he requires in billing, in service application
1547 needs and the other manifestations of adequate service to which we feel he is entitled and which he, himself, requests.

—842—

Q. Will you explain the Company's record as to system loss? A. It is a characteristic of electrical circuits, of course, that energy is not transported at 100 per cent efficiency. That is, there is loss. System efficiency may be defined as the ratio between the energy distributed to the ultimate consumers divided by the energy output from the generating plants.

The difference in the amount of such energy delivered
1548 from the system and supplied to the system is largely electrical losses. Correction must be made for the amount which has been used by the Company in its own operations and this is usually taken into account.

The percentage of such losses is a guide to designers and in less measure to the operators of the system in determining the effectiveness with which the system has been designed and built and with which it is operated.

Q. Specifically, what is your record on system losses? A. As of 1939, the percentage loss on the Cleveland Electric Illuminating Company system was 11.67 per cent, and over the last nineteen years—the period 1921 to 1939, inclusive—

this loss has averaged almost exactly that figure or 11¾ per cent.

A maximum loss, percentagewise, occurred in 1935 when the percentage of loss rose to 12.65 per cent., and the mini-

—843—

mum loss percentagewise occurred in 1927 when the percentage of loss was 10.98.

The high loss of 12.65 per cent. in 1935 resulted not so much from the losses having increased on the system per se, but rather that the output from the system had so been re- 1550 duced by business conditions as to make the ratio between the losses and the total input or output high.

Q. So that during this entire period, despite a substantial increase in territory served, the percentage loss has remained fairly constant, is that correct? A. Yes, it has. The effects are in some measure compensating. That is, as the territory served has increased, and the number of lines and transformers which might cause loss have increased, the volume of business has similarly increased, and the relationship between the loss and the total input to the system has remained substantially constant. 1551

Q. Where did the major portion of losses occur—in what phase of the system operation? A. The losses on the system may be classified as occurring in the transmission system, which losses are in the transformers and the lines associated with the hundred and thirty-two and sixty-six thousand volt transmission system, also in the thirty-three and eleven thousand volt lines supplying distribution sub-stations.

—844—

The second class of loss is the conversion loss which occurs in motor generator sets or rotary converters and associated equipment at direct current distribution sub-stations.

1552 *Elmer L. Lindseth—By Respondents—Direct*

A third class of loss is the transformation loss which occurs at step-down transformer banks at distribution sub-stations for alternating current output; and a fourth category is that of distribution loss which occurs in the distribution lines, regulators, transformers, serving the distribution system from the sub-station to the consumer.

Q. And in what phases among those you mentioned are the losses heaviest? A. The major portion of the over-all system loss occurs in the main transmission system, where,
1553 as of 1939, 4.37 per cent. of all the output of the power plants of the company was absorbed as transmission loss.

Related, however, to the amount of energy put into a particular branch of the Company's system, the conversion loss at direct current sub-stations is percentagewise the greatest.

Q. That loss is experienced in the conversion of alternating current to direct current, is that right? A. That is right, and last year such loss reached 9.73 per cent. Because, however, relatively a small amount of the company's total energy is converted to direct current, the percentage of the total
1554 over-all system input which was loss in conversion, was but .87 per cent. Transformation loss was .93 per cent., and the

distribution loss from all causes, 5.50 per cent.

Q. What has the Company's record been in reduction of electric operating expense? A. In the history of the operations of the Company, the trend in electric operating expense per kilowatt hour sold has been steadily downward, culminating in a value reached in 1939 of less than seven mills——

1555

Mr. Buswell: I didn't hear the last part of that. Would you read that answer again?

Mr. Hamilton: Read it back, please.

(Whereupon the answer above recorded was read by the reporter.)

The Witness: (Continuing)—per kilowatt hour.

Mr. Buswell: Thank you.

The Witness: That was lower than for any year in the Company's history.

1556

Mr. Hamilton: May this document be marked as Respondents' Exhibit No. 24 for identification?

The Examiner: Yes.

(The document referred to was marked for identification as Respondents' Exhibit No. 24.)

By Mr. Hamilton:

Q. Will you explain, Mr. Lindseth, what Respondents' Exhibit No. 24 for identification portrays? A. This curve

—846—

sheet, in the curve at the top, shows the electric revenue 1557
received by the Company per kilowatt hour sold as an overall average for all energy. In the curve below it, the solid line, there is shown the trend in total electric operating expenses per kilowatt hour sold, over the same period from 1921 to 1939.

Total electric operating expenses include all expenses for production——

Q. (Interposing) If you will, just identify the other two lines. A. Very good. The next curve shown as a dash line, bearing the legend "other electric operating expenses per

kilowatt hour sold" and the fourth curve—the dotted curve at the bottom of the sheet—shows the electric production expense per kilowatt hour sold.

Q. This chart or diagram has been prepared under your supervision? A. Yes, it has.

Q. The facts shown are taken from the records of the company? A. Yes, they are. From the statistical department records.

Mr. Hamilton: I offer it in evidence as Respond-
1559 ents' Exhibit No. 24.

Mr. Buswell: No objection.

The Examiner: It is admitted in evidence under the number mentioned.

(The document referred to was received in evidence as Respondents' Exhibit No. 24.)

By Mr. Hamilton:

Q. Now, Mr. Lindseth, the second curve on the map which you have referred to—on the diagram, rather—is stated to
1560 be total electric operating expenses before deferred up-keep and taxes, is that correct? A. As the caption, the curve sheet specifically limits the data, the electric operating expenses are before deferred up-keep and taxes.

Q. And that curve to which I have referred is the composite, is it not, of the two curves shown immediately below it? A. Yes. It is the arithmetic sum of each of the two components of total cost, the lower one being the production expense at the powerhouses for the generation of the energy; the second curve "other expense" being all other expense incurred by the Company in distribution, transmission, main-

tenance, commercial expense, administrative expense, and other similar elements.

Q. And there are similarly excluded from other electric operating expenses, as shown, and electric production expense as shown, items of deferred up-keep and taxes for the

—848—

period? A. They are excluded. Reference to these curves will show that the long-time trend in the expense for electric production, the dotted curve near the bottom of the sheet, has shown a marked decline from 1921 to 1939. The value 1562 of production expense in 1921 was 7.3 mills per kilowatt hour. The corresponding figure in 1939 was 2.6 mills per kilowatt hour. The lowest value experienced, however, during this nineteen year period was reached in 1933, when the production expense reached a low of 2.6 mills which was the lowest cost at which energy has ever been produced on a yearly average basis in the history of the Company.

This was realized as a result of quite low cost of coal, during which year the average cost of coal for electric and steam-heating was $2.41 per ton. The corresponding cost in 1939 of fuel was $3.06 per ton. 1563

Q. In general, what items enter into the determination of electric production expense? A. Electric production expense, which is the cost of operation at the power-houses of the Company, includes as the major element the cost of fuel, itself. Added to the fuel expense, there is, however, the labor of attendance at power plants, the maintenance of power plants, supervision of power plants, the handling of coal and the unloading thereof, the services of watchmen and electrical operators at the power plants.

—849—

1564 *Elmer L. Lindseth—By Respondents—Direct*

Q. And in general, what are the components entering into a determination of other electric operating expenses as shown on the chart? A. Other electric operating expense includes all other elements of the Company's expense and includes the transmission line operation and maintenance, sub-station operation and maintenance, the distribution system operation and maintenance, utilization equipment, largely street lighting, operation and maintenance, and a minor element of undistributed expense.

1565 To these specific expense items there are added the administrative expense, commercial and business promotion expense, injuries and damages to workmen and certain undistributed expense, injuries and damages to workmen and certain undistributed expenses such as insurance, uncollectable accounts, the cost of public regulation as charges to the Public Utilities Commission, and these, in the aggregate are electric operating expenses exclusive of production.

The Examiner: Referring to this chart, Respondents' Exhibit 24, as to electric production expense by

1566 1939, wasn't that as low as it was in 1933? These lines seem to indicate that.

The Witness: Within the ability to portray the facts on the chart, that observation is correct. Each of the charges was 2.6 mills per kilowatt hour, but in one case it was 2.63 mills, and in the other case 2.56

mills, so it is a hairline difference.

The Examiner: I wanted to get the figures on it.

The Witness: Yes.

By Mr. Hamilton:

Q. In which case was it lower? A. In 1933, the production expense reached the all-time low value of 2.56 mills per kilowatt hour. The corresponding figure in 1939 was 2.63 mills.

Q. Has the reduction in production expense over the period shown been due in part to obtaining a higher efficiency from fuel? A. In substantial measure the reduction in production expense has resulted from an improvement in fuel economy or in fuel consumption per kilowatt hour sold. 1568
Over the period from 1921 to 1939, there has been a marked reduction in the price of coal per ton. The value or the cost per ton of coal in 1921 was $4.77, an effect of the post-war inflation of prices which had reached a maximum in 1920, during which coal costs had risen to $5.77 average.

By 1923, the price of coal had already declined to less than $4.00, and by 1928, had declined to $3.08 per ton which was substantially the cost experienced in 1939 when the average price was $3.06.

It may then be said that the effect, as between 1921 and 1569
—851—
1928, was made up not only of an improvement in fuel economy per kilowatt hour, but likewise resulted from a reduction in the price of coal per ton, but since 1928, the over-all reduction in the eleven year period, as between 3.3 mills in 1928 and 2.6 mills in 1939, this reduction has resulted entirely from improvement in the economy of operation of the system.

The over-all pattern here has been one of long-range downward trend in total operating expenses per kilowatt

hour. However, marginal economics enters the picture here, and the opportunities for further reduction in production expense are limited by marginal opportunities to reduce the fuel required per kilowatt hour, and it is noted that the long-range trend in other operating expense per kilowatt hour is —with the exception of a high point during the depression, when the output was low—substantially a horizontal trend at about four mills per kilowatt hour.

This item of total expense, other operating expense per
1571 kilowatt hour sold, reached a value of 3.96 mills per kilowatt hour in 1939, which was the lowest value experienced during the period 1921 to 1939, although it was equalled in 1925 when the value was the same—3.96 mills.

The aggregate of the two, however, which makes up total electric operating expenses per kilowatt hour, is at an all time low as of 1939, having reached 6.9 mills. This was the

first year in the history of the operation of the company, when the total operating expense per kilowatt hour sold had dropped below seven mills.

1572 Q. What was the figure on—the precise figure—on electric revenue per k. w. h. for 1939? A. The electric revenue per kilowatt hour sold in 1939 was 1.768 cents per kilowatt hour. This is identical with the average revenue per kilowatt hour experienced in 1936. Within the period covered by the curve, namely from 1921 to 1939, the trend in average revenue in the long range has been downward. It was interrupted during the period of the depression in the early thirties, by virtue of the fact that industrial consumers, by using less of energy in relation to the whole, had the effect of showing an apparent increase in over-all figures, even though certain

classes of business, such as residential, showed a continuous and unbroken decline.

During periods of low industrial activity, when the percentage of the total output of the company, which goes to low revenue customers, is reduced, then the weighted average revenue per kilowatt hour goes up.

Similarly in 1938, when industrial activity was substantially curtailed in the Cleveland district, the electric revenue per kilowatt hour sold shows an increase because of the decreased influence of the large industrial users. 1574

Q. How many pounds of coal is required to produce a

kilowatt hour of energy in your own system? A. As of 1920, the fuel economy of the system, when measured in terms of B. t. u. per kilowatt hour generated, was at the rate of 28,000 B. t. u. per kilowatt hour. Since that time there has been a steady and substantially unbroken decline to a value of 14,700 as of 1939, and the corresponding quantities of coal required per kilowatt hour were about two and one quarter pounds of coal per kilowatt hour—the early point, 1920—as compared with one and one-fifth pounds of coal per kilo- 1575 watt hour as of 1939.

Q. Actually, the significant factor is the B. t. u. rather than the pounds of coal, is it not? A. Yes; for more precise measurement of performance, the B. t. u. per kilowatt hour is to be preferred because the heat content of coal fluctuates over wide limits and the unit is not as precise when expressed in pounds of coal per kilowatt hour.

Q. Turning now to the Company's promotional policies, would you state the functions of your sales program?

1576 *Elmer L. Lindseth—By Respondents—Direct*

Mr. Binford: Mr. Examiner, I don't believe the witness has been qualified except as a technical advisor to the president, nor has he stated that he has any familiarity with the sales activities of the Company. If such question is asked, I object to the question.

Mr. Hamilton: I think, Mr. Examiner, if you will refer to the transcript, you will find that his qualifi-

—854—

1577 cations cover this aspect.

Mr. Binford: If he can state now that he is familiar with those activities from his own knowledge, I withdraw the objection.

(Discussion off the record.)

The Examiner: I understand counsel for the Commission has withdrawn his objection and you may proceed, Mr. Hamilton.

Mr. Hamilton: Would you read back the pending question?

1578 (Whereupon, the pending question was read by the reporter.)

The Witness: The sales program of the company has essentially two functions:

One, the promotion or building of load, increase of consumption among consumers; second, the furnishing of sales service to consumers in the matter of adequate information on opportunities for the use of electric service and other similar information.

By Mr. Hamilton:

Q. You merchandise appliances yourself? A. No, the company does no merchandising of appliances. Never in the history of the company has the company, itself, in its promotional program, accomplished these ends by the actual selling of equipment, appliances or apparatus to its consumers.

Throughout this history, it has accomplished its ends in

increasing the distribution of load-consuming devices, appli- 1580
ances, lighting equipment, and other facilities for the use of current, through cooperation with dealers, distributors, manufacturers, retailers, and other outlets.

This program has been followed by the Company with the distinct feeling that by such energetic cooperation and fostering of sale by others, the ends may be effectively achieved. The company has thus obviated competition between itself and its customers, there referring to its customers as retailers and sellers of electrical appliances, who are engaged in other branches of the electrical industry, and the company has enlisted the cooperation of hundreds of 1581
concerns in the electrical trade, bringing together their resources for the cooperative promotion of electrical appliances, domestic, commercial, industrial, institutional, and all other classes.

Q. Now, is one of the objectives in the sales program to assist the consumer in obtaining the greatest possible value from the electrical service? A. This is one of the functions of the service phases of the company's sales program. For example, without adequate education of the consumer of the opportunities afforded to use electricity and the numerous

1582 *Elmer L. Lindseth—By Respondents—Direct*

labor-saving electrical appliances and devices, the maximum opportunities for promotion are not realized.

Electrical education then constitutes an important part

—856—

of the company's sales service functions. It calls for highly specialized services in certain cases, such as in industrial activities where the services of highly skilled technicians may be required in matters of electric furnaces or heat-treating, specialized motor applications.

1583 It requires the services of lighting specialists, illumination engineers, in providing proper lighting in school rooms, offices and th like. It calls for assistance to residential consumers in educating them in matters of home lighting, home economics, domestic cooking and similar efforts. These service activities are offered by the company to the consumers without charge, and the company regards provision of such services as a fundamental and essential part of the complete electric utility service to the consumers.

As a result of a rather long history of such sales service to consumers, they have come to expect such sales service as

1584 a natural component of the utility service which the company provides, and they have come to expect it as a natural component of the service of the company.

Architects, engineers, business men, in the planning and purchasing of electrical equipment, frequently call on the company for service of this character, and such service is freely rendered by the company. The high degree of electrical development in the territory exists, we think, in substantial measure as a result of such service provided by the company, and the confidence resulting therefrom on the part of

—857—

the consumers.

1585

Q. How extensive in size and scope is your sales program? A. The sales program last year—and it was not an extraordinary year—required $735,000.00 of expense. There were 165 men in the program in the sales department. All divisions of the company's promotional efforts were represented, and this effort is the sales department alone without the corresponding expenditures and personnel required in the advertising department.

The sales department comprises a number of specialized divisions and operators, the company's vice president in 1586
charge of sales. The advertising activities of the company are under an assistant to the president, who is in charge of advertising and product of publicity and his staff is independent from the staff of the sales department although working very closely with it.

Under the vice president in charge of sales there is a power division with a supervisor and fifteen employees; a retail commercial division, embracing a supervisor and twenty-three employees; a residential division, made up of four branches with seven supervisors acting under a director of residential sales, and with a personnel of sixty-nine em- 1587
ployees under these supervisors.

—858—

Other divisions of the Company are the street lighting division with a supervisor and two employees, a research promotion division, a supervisor and three employees, an office division and a separate division operating in the three counties shown at the eastern portion of the system in Exhibit 21 under a supervisor with fourteen employees.

In addition to these, there is a substantial personnel at the Electrical League, which is a cooperative effort of the

1588 *Elmer L. Lindseth—By Respondents—Direct*

company and which I will describe in some detail later, the staff of which consists of the President of the League and twelve other employees.

Q. What proportion of the efforts or expense of the sales program is devoted to residential consumers? A. Of the divisions which I have described as the residential division, comprising merchandise promotion, home service, home lighting, and the Electric Home Bureau, these under the director of residential sales, are responsible for the expenditure of
1589 about 70 per cent. of the total sales expense, and this domestic sales division and the sales promotion division are the largest of the divisions in the Company's sales program.

The residential sales program of the Company must, in large part, bear the burden of pioneering electrical appliances. Merchants, by and large, are neither willing nor in the usual case are they economically able to pioneer the sale

—859—

of load-building devices.

In the early stages of development of markets, even for appliances which are usually thought of as highly necessary
1590 to modern convenience in the home, the Company has had to bear the burden of that early promotion.

For example, fifteen years ago, when the electrical refrigerator in the home was not at all an accepted appliance, it devolved upon the Company to do the advertising, encourage the dealers and distributors to offer the appliance, display it on their floors, and to train salesmen who might get the sales story across to the ultimate consumers.

Similarly, in recent years, the electric range, before it became an accepted product and in demand by the public, had to rely for its promotion on the efforts of the Company,

so in the early stages of virtually all load building appliances, the Company bears the burden of the promotion.'

Q. What were the first steps in this program of sales promotion? A Are you speaking now of residential promotion?

Q. Residential. A. The early efforts of the Company in residential sales promotion centered almost exclusively around lighting. In the period from 1910 to 1921—a period in which the number of customers of the Company was growing very rapidly—and during that period the number of cus- 1592
tomers increased from 30,000 to 180,000—an increase of six

—860—

times. Those customers were acquired largely as a result of effort on the part of the Company to encourage the wiring of homes formerly lighted by gas, to encourage the adequate wiring of new houses, but in very substantial measure the substitution of electric lighting fixtures for gas lighting fixtures, appliances were almost non-existent prior to 1921, although there were a few electrical merchandise stores and electrical contractors who offered washing machines, vacuum 1593
cleaners, both of which began to appear about 1915, and the electric iron.

The early efforts then were, substantially all of them, efforts to sell the idea of electric lighting. By 1921, a survey of results showed that the average six-room house had but twenty-one outlets therein. These outlets were, virtually all of them for lighting, consisted mostly of ceiling and wall fixtures with only possibly a single base plug outlet in the living room for a decorative lamp.

1594 *Elmer L. Lindseth—By Respondents—Direct*

Light, as a tool for seeing, hadn't yet been developed at all. During the next period, however, from 1921 to 1933, very special attention was given by the Company to educate the public in the requirements of adequate light and the effort was largely devoted to the encouragement of increasing the number of lighting outlets in the home.

During this period electrical homes were opened for exhibition in the city, and three such homes were opened in

—861—

1595 1921, but in the next two years, sixty-six additional homes were opened to the public.

This effort has continued during the past twenty years, to serve to educate the public in the adequacy of lighting and the opportunities for lighting as an instrumentality to seeing. The greatest increase resulting from this effort in the number of outlets in new homes took place just prior to 1923, when the increase over the 1921 level had been more than 200 per cent. and the recent statistics indicate an average number of outlets per home of sixty-four.

1596 During this period, many hundreds of such electrical homes have been exhibited and in these homes not only has lighting been promoted, but appliances as well.

The Examiner: Let us recess at this point until 2:00 o'clock.

(Whereupon, at 12:30 o'clock p. m., the hearing was recessed until 2:00 o'clock p. m. the same day.)

—862—

AFTERNOON SESSION

The Examiner: You may proceed, gentlemen.

Whereupon, ELMER L. LINDSETH resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Mr. Hamilton: May this document be marked as Respondents' Exhibit No. 25 for identification? 1598

The Examiner: All right, let it be so marked.

(Exhibit 25 for identification on behalf of Respondent, marked.)

By Mr. Hamilton:

Q. Will you explain what Respondents' Exhibit 25 for identification portrays? A. This exhibits shows for the Cleveland Electric Illuminating Company the residential revenue per kilowatt hour sold from 1905 to 1939, inclusive, and the average annual use per residential consumer in kilowatt hours per year from 1910 to 1939, inclusive. 1599

Q. This chart was prepared under your supervision? A. Yes, it was.

Q. The facts shown are taken from the records of the Company? A. Yes, from the statistical department records.

Mr. Hamilton: I offer it in evidence as Exhibit 25.

Mr. Binford: No objection.

—863—

The Examiner: All right. It is received under the number assigned it.

1600 *Elmer L. Lindseth—By Respondents—Direct*

(Respondents' Exhibit 25 for identification received in evidence and so marked.)

Mr. Hamilton: May this document be marked as Respondents' Exhibit No. 26?

The Examiner: That may be done.

(Respondents' Exhibit 26 marked for identification.)

1601 *By Mr. Hamilton:*

Q. Will you explain what Respondents' Exhibit 26 for identification portrays? A. This chart shows the revenue received from general commercial customers per kilowatt hour sold for the period from 1912 to 1939, inclusive, and the average annual use per general commercial consumer expressed in kilowatt hours per year for the period 1916 to 1939, inclusive.

Q. This chart similarly has been prepared under your supervision? A. Yes, it has.

Q. The facts shown are taken from the records of the
1602 Company? A. Yes, from the statistical department records.

Mr. Hamilton: I offer it in evidence as Respondent's Exhibit No. 26.

—864—

Mr. Binford: No objection.

The Examiner: It is so admitted in evidence under that number.

(Respondents' Exhibit 26 for identification, received in evidence.)

Mr. Hamilton: May this be marked as Respondents' Exhibit No. 27 for identification?

The Examiner: It may be so marked.

(Respondents' Exhibit 27 marked for identification.)

By Mr. Hamilton:

Q. Mr Lindseth, will you explain what this exhibit portrays? A. This chart shows the large commercial and industrial revenue of the Company per kilowatt hour sold for the period 1914 to 1939 inclusive, and the average annual use per consumer for the large commercial and industrial classes from 1916 to 1939, inclusive. 1604

Q. This exhibit similarly has been prepared under your supervision? A. Yes, it has.

Q. And the facts shown have been taken from the records of the company? A. Yes, from the statistical department records.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 27.

—865— 1605

Mr. Binford: Mr. Examiner, I believe the expression "large commercial and industrial revenue" should be explained or the chart is unintelligible.

Mr. Hamilton: Will you at this time, Mr. Lindseth, explain the difference in classification between the general commercial revenue shown on Exhibit 26 and large commercial shown on Exhibit 27?

The Witness: Under the definitions prescribed in the Company's rules for rate classifications, general commercial customers and those customers who are

1606 *Colloquy*

billed under the general commercial rate schedules are commercial customers whose demand is less than 20 kilowatts of demand. Large commercial customers are those whose business and needs might be similar to those of a general commercial customer but whose demands exceed 20 kilowatts demand, for which conditions of service there is a different rate schedule available.

1607 Industrial customers differ from larger commercial customers only in respect to size and customers consuming alternating current in excess of 500,000 kilowatt hours per month and meeting certain other requirements of the company's rate schedules having to do with the resale of energy, are classified as industrial customers.

The class of large commercial and industrial then are in accordance with the Company's filed rate schedules as a specific group of customers whose demands exceed 20 kilowatts.

—866—

1608 Mr. Binford: These terms as used in the captions of the two documents last offered are used in the sense in which you have just described them?

The Witness: They are.

Mr. Binford: No objection.

Mr. Hamilton: I had offered this exhibit as No. 27.

The Examiner: All right. This last chart which has been marked for identification is now received in evidence as Respondents' Exhibit No. 27.

1609

(The chart marked Respondents' Exhibit 27 for identification, received in evidence.)

Mr. Hamilton: May this document be marked as Respondents' Exhibit No. 28 for identification?

The Examiner: Yes.

(Respondent's Exhibit No. 28 marked for identification.)

1610

By Mr. Hamilton:

Q. Will you explain what Respondents' Exhibit No. 28 portrays? A. This shows for the Cleveland Electric Illuminating Company the history of residential electric rates for consumers using 20, 50 and 100 kilowatt hours per month for the period from 1900 to 1940, including a rate reduction made effective on July 7, 1940.

Q. I will ask you later to explain certain features of this

chart. For the moment will you state whether this chart has been prepared under your supervision? A. Yes, it has.

1611

Q. And the fact shown are taken from the records of the Company? A. They are.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 28.

The Examiner: Let it come in as Respondents' Exhibit No. 28.

(Respondents' Exhibit 28 for identification received in evidence.)

1612 *Elmer L. Lindseth—By Respondents—Direct*

By Mr. Hamilton:

Q. I will ask you later, Mr. Lindseth, to refer to the specific exhibits for certain information.

Prior to the taking of the recess you were engaged in describing the promotional activities and sales activities of the Company. Could you now state whether there are any other functions of sales promotion other than those you have already described? A. In addition to those which I described as sales service and sales promotion, there is the distinct
1613 requirement of the Company's sales promotion policy that it be directed at holding load already obtained or acquired as well as the building of that and new load. The business of the Company is not without competition from gas, from oil and other industries. For example, the gas refrigerator

is a mechanical refrigerator with which the electric refrigerator must compete. In the replacement of appliances a competitive market exists and it is to insure the continued electric serving of these customers that an important phase
1614 of the company's efforts is directed.

Similarly in commercial and industrial activity there is competitive with the electric furnishing of power that made available through oil engines, for example, and the steam turbine and although load may at the moment be served by the Company, there is the hazard of the loss of that load to competitive power sources, the protection against which is the job of the sales department.

The electric utility business is essentially one of slow turnover, that is there is required a substantial investment when related to the annual gross revenue. For the year

1939, for example, the relationship between the Company's fixed assets and the gross revenue was $4.88 of fixed assets per dollar of gross revenue. For the last five years this ratio has averaged about five. That is, $1.00 invested in the business requires five years of business to be recovered in gross revenue alone.

Such circumstances make it especially important that once load is acquired and the investment made to serve that load, that the load be retained. This requires insuring the complete satisfaction of the customer in regard to durability, 1616
dependability, economy and general satisfaction.

—869—

Q. Is there a so-called Electrical League in Cleveland? A. Because the Company does not and has not merchandised appliances, it has operated through an organization known as the Electrical League of Cleveland which is a cooperative venture between the Company, the dealers, and the distributors of electrical merchandise in the community.

Q. Will you describe further the functions of the Electrical League? A. The League is a corporation not for 1617
profit, incorporated in 1909, and has for its objects, among others, the improvement in the electrical business for the benefit of the citizens of Cleveland.

During the early part of its history its function was largely social among dealers, dealer representatives, distributors, salesmen and others concerned with the distribution of electrical appliances, but there soon developed a definite need for cooperative business efforts, the training of salesmen to better represent their principles in the moving of merchandise and the League expanded its efforts some ten

1618 *Elmer L. Lindseth—By Respondents—Direct*

years after its inauguration in the development of this Cleveland market.

Q. Had you told us how the League is constituted? A. The League membership is made up from dealers, from jobbers, from manufacturers, from representatives of the Cleveland Electric Illuminating Company, and from any others interested in the merchandising and promotion of electrical merchandise and electrical appliances.

—870—

1619 The number of members participating is 322 as of 1940, who have contributed to the League's general fund for promotion and development of the electrical merchandise market. The development which started, and which I mentioned, some ten years after the formation of the League, namely about 1920, proposed to enlarge the possible market for electrical merchandise and to enlighten the public on the subject of electricity.

Following this announced policy in 1920, the size of the League grew rapidly and the number of supporting companies, dealers and others, increased from 132 in 1921 to
1620 185 by 1923, and to the figure I have mentioned, 322, as of the present time. A substantial or the major portion of the League's funds have been used to promote the sale of equipment for the use of electricity in the home, that is residential appliance merchandising, but the League program has also included the promotion of the commercial and industrial uses of energy through the necessary merchandising or commercial and industrial equipment.

Q. Are there other activities which it sponsors? A. Yes, an important additional activity which the Electrical League

sponsors in connection with the industrial and the commercial phases of its activity is the Electrical Maintenance Engineers' Association of Cleveland. This is an organization of engineers employed by the industrials in the community who are users of electricity and the association has for its object to encourage the development and economical

—871—

application and use of electrical equipment in industry. The group has monthly educational meetings which include inspection trips to manufacturing plants and has a member- 1622
ship of about 750 representatives.

Q. And does this League have a publication of its own? A. The organization I have just described, this Maintenance Engineers' group, is informed, as are the executives of the industrial plants, through the Electrical Production Magazine which has been in circulation since 1927 and has a circulation of about 3,300 per month, the object of which is to inform executives in commercial and industrial enterprises as to the uses of electricity in industry and similar promotional efforts.

Q. It serves a merchandising function then? A. Yes, it 1623
does serve a merchandising function to the extent that it calls to the attention of these commercial and industrial consumers available equipment for the use of electric energy, but it serves a broader function of serving to educate those persons as to economical methods to use existing equipment, new methods by which existing equipment may be used to better advantage, and in general a broad promotional program among industrial consumers.

Q. Do you feel that the activities of the League have been beneficial in promoting increased electrical use? A. Yes.

As may be seen from Exhibit 22, containing certain system growth statistics of the Company, there has been in the

—872—

period from 1910 to 1940 a very striking growth in the Company. The kilowatt hours of output have increased, for example, from some 80,000,000 hours per year in 1910, to 1,800,000,000 by 1939. Such growth is due, of course, to many causes. However, it is felt that important among these causes is the promotional effort given by the Company

1625 through the Electrical League and other activities to the increased use of electric energy.

Q. Does the League sponsor exhibits of various sorts? A. Yes, the League has in the past to a greater extent than recently, met the needs of the community when inadequate displays of appliances were available, by having a so-called exhibit of everything electrical to the home, which was a centralized exhibit in the quarters owned by the Electrical League, or leased by them, in which were displayed appliances and other electrical merchandise on a cooperative basis

1626 by all manufacturers and all dealers and distributors. No merchandise was sold but here was available a centralized showroom in which a prospective purchaser might examine all the available makes of equipment.

By 1935 or thereabouts, electrical merchandising had assumed so important a place in the community that the department stores and certain of the major appliance dealers had actually more appliance display space available to the public than did the Electrical League, and since the Electrical League had thus served its purpose of pioneering the display of equipment and putting it on so substantial a basis

1627

that it could be taken over by the dealers, that the League

—873—

discontinued its display of merchandise.

Q. Does the Company actually sell appliances, itself? A. No, the Company does not and has not sold appliances.

Q. You merely assist in the sponsorship of this cooperative enterprise, is that right? A. Yes. It still is a distinct obligation of the Company to teach merchandise salesmen how to sell and dealers how to sell and promote their products.

1628

The big weakness in the distribution of electrical merchandise in the territory of the Company is not the lack of excellent products, neither is it the lack of available service at good rates, but the problem is a problem of inadequate selling. The average appliance salesman is not a good salesman and one of the definite tasks of the Company operating as itself and through the League, is the training of salesmen for these dealers.

Q. You do have a sales division, do you not, in your operating personnel? A. Yes, the efforts which I have described in connection with encouraging the better selling

1629

of appliances, is carried on through a merchandise promotion division of the residential division of the sales department. This merchandise promotion division is of a supervisor with about 12 assistants who are charged with the responsibility of assisting dealers in the attractive display of merchandise, in the training of dealer salesmen, in the running of cam-

—874—

paigns among dealer salesmen to encourage improved results, the stimulating of cooperative advertising by such dealers.

and in general to encourage the better selling on the part of the dealers who merchandise the appliances in the district.

Q. Do you have advisers on home lighting to contact customer outlets and carry on educational programs? A. A very important effort of the Company is that of "Better Light—Better Sight". The Cleveland Company, in its early residential promotion, devoted its efforts almost exclusively to lighting and the importance of the lighting market has not been lost sight of, even in recent years when such very
1631 considerable prominence has been given to electrical appliances in improving the ease and convenience of the home.

The "Better Light—Better Sight" program has been in large measure an educational program to bring to the attention of people the importance of light in seeing. It has, however, had a counterpart in the sale of merchandise through cooperative efforts with dealers, distributors, retailers and others, to encourage the sale of lighting appliances, lamps, student lamps, table lamps, and similar merchandise.

The "Better Light—Better Sight" effort in the educa-
1632 tional aspects of it has been carried on through speakers who have spoken to audiences in the interest of eyesight conservation in the past six years, which audiences have totalled more than a million people in the territory served

by the Company.

In addition to the lighting story there is further additional promotional information furnished on major appliances such as ranges, refrigerators, air conditioning equipment, stokers and other home appliances.

During the last year more than 15,000 people who have been interested in the building or purchasing of new homes have attended a series of meetings to learn more about planning, decorating, equipping and operating an all-electric home.

Q. Have those meetings been sponsored by the Company or by the Electrical League? A. The sponsorship of those meetings is usually by the Electrical League, although the participation of the Company in the activities of the League is well known and although the effort is specifically identified 1634
as a League effort. All persons dealing with the League well realize that the responsibility of the Company is behind the effort.

Q. Is the same comment applicable to the "Better Light—Better Sight" program you spoke of? A. Yes, the same comments are applicable.

Q. Now, what have been the results of these promotional policies on use of appliances in your territory? A. In the matter of lighting, for example, about which I have just spoken, as a result of the "Better Light—Better Sight" program and in addition through the activity of the Home 1635

Lighting Advisers who have visited in the homes of the community to encourage the use of lighting and to educate the consumers in the advantages of adequate lighting, there have been added in the connected load of the Company in five years more than 53,000 kilowatts of lighting.

Q. Which five years are these? A. These are the five years from September 1935 when the effort of Home Lighting Advisers in visiting the homes was begun, until June of 1940.

The program followed by these Home Lighting Advisers which began five years ago and who now number 40, is a program of direct visitation to the home, the testing of the efficiency and the adequacy of the lighting as furnished by the fixtures in the home, survey of available lighting intensity and lighting outlets, and recommended improved methods of lighting to the householder.

This has been a very popular phase of the Electrical League's activity. It has been one which has been requested
1637 on the part of a large number of home owners who have heard about the service rendered to others and have asked to have their own homes surveyed. It has resulted in vastly improved lighting, especially for school children, for home lighting has now been demonstrated to be a very effective tool in quick learning and rapid progress.

The number of Home Lighting Advisers now serving the Electrical League is 40. The number has been as great as 60 in 1937. At the beginning of the program in 1935, how-

ever, I believe the effort started with about 20. The number
1638 of homes that have been visited is 225,000 since the inauguration of the program and the total number of visits by Home Lighting Advisers has been 312,000. That is 87,000 of these homes that have been surveyed at sometime in the past have been resurveyed with a second visit from the Home Lighting Adviser.

The effectiveness of the program may be gathered from the results found in the kitchen, for example, where considerable importance should be given to adequate lighting because it is the room in the average home where the housewife spends a considerable amount of time and where lighting without

careful attention is likely to be inadequate. At the outset of the program in 1935 on the first call of the Home Lighting Adviser it was found that the average wattage in the kitchen lamp, or the kitchen fixture, was 82.5 watts. By 1936 this wattage found on the first call was found to have increased to 91. By 1938 it had reached 93, and as of 1940 the wattage in the kitchen in homes heretofore not surveyed is found to be 97.6.

This increase in wattage from 82.5 to 97.6 is a percentage increase of about 18 per cent. 1640

More significant, perhaps, than the wattage found on the first call is the wattage found in the kitchen on the second call to these more than 80,000 homes that have been resurveyed a second time.

—878—

No re-survey is made prior to 18 months after the first visit and it is found now that homes re-surveyed have a wattage of lamps in the kitchen which average 108.2 watts, a wattage some ten per cent. greater than the figure of 97.6 watts in the homes being surveyed for the first time.

This is illustrative of the effectiveness of the program in 1641 improving the lighting only in a single room, the kitchen, but it is thought that the kitchen is an excellent measure of the general level of lighting throughout the house.

Q. Who makes these surveys you spoke of? A. The surveys are made by the Home Lighting Advisers who represent dealers in the community under the sponsorship of the Electrical League. Because neither the League nor the Company desires to merchandise either appliances or lamps, and since the Home Lighting Advisers definitely do sell lamp bulbs for the improvement of lighting intensity in the home, and

sell lamps and other fixtures, these Home Light Advisers do not represent the League or Company directly, but represent dealers in the community.

The Home Lighting Advisers are, all of them, girls, ladies, and as representatives indirectly of the League but directly of dealers, perform these operations in the home.

Q. They are employees of the individual dealers, are they, or of the League, itself? A. Indirectly of the dealers under the sponsorship of the Electrical League.

1643 —879—

In the matter of results from major appliance promotional efforts, two of the outstanding electrical appliances available in the home are the refrigerator and the range. The electrical refrigerator was first introduced on any commercial scale for residential use in the middle 1920's and because it was felt that it satisfied a long felt need and was a definitely satisfactory piece of electrical merchandise it enjoyed an extraordinary acceptance among electrical users everywhere. The saturation of electrical refrigerators in the Company's territory—that is, by saturation I mean the ratio
1644 between the number of consumers now owning electrical refrigerators and the total number of consumers—that saturation is 65 per cent.

Electric refrigerator sales are still being made at a very rapid rate. It is still a very important electrical appliance in the merchandising field, even though the saturation is as high as 65 per cent.

Q. Is that a system saturation you are speaking of? A. That is the saturation throughout the territory. For example, last year there were sold in the Company's territory more than 27,000 refrigerators. Yet this year to date the

1645

sale of refrigerators is at a rate of 27 per cent. in excess of that last year. In the sale of electric ranges which is a high energy-consuming device and which requires in its annual operation about 2½ times as much electric energy as does the refrigerator, the saturation is not merely as great as in the case of refrigerators and is about 6 per cent. throughout the territory.

—880—

The situation is not, however, strictly comparable in the matter of consumer acceptance of the range as against the refrigerator because of the competitive situation. 1646

Cleveland is a community in which natural gas is available to a vast majority of our customers at quite low rates, and since natural gas has been for many years the accepted fuel for cooking, the Company must still consider the electrical range in the pioneering stage of promotion, especially in those portions of the territory where gas is available.

In the district shown on Exhibit 21 as the eastern three counties of the Company, natural gas is not available throughout that territory. In fact, manufactured gas is distributed in certain of the cities such as Ashtabula and Fairport, and in many of the smaller communities no gas at all is available. In such territories, the saturation of electrical ranges is very much greater than in the city of Cleveland, and in that general district the saturation of ranges is in excess of 20 per cent. 1647

The number of electrical ranges being sold, however, is on an increasing curve and although last year there were connected to the Company's lines about 3,800 electric ranges, the year 1940 to date shows an increase of 36 per cent. in ranges connected to the Company's lines over the same period in 1939.

1648 *Elmer L. Lindseth—By Respondents—Direct*

It is further to be noted in connection with this, that the

—881—

rate structure of the Company was not conducive to the encouragement of electric cooking prior to 1937, when the promotional rate reduction of April 1 of that year was made, so that the range business is still in the preliminary stages of ultimate developments.

There are, however, at the moment, 152 qualified dealers in the territory of the Company representing fifteen manu-
1649 facturers as against very, very few such dealers active in the territory in 1935.

Q. You spoke of the various enterprises conducted by the Electrical League. Does it also have an Electrical Home Bureau? A. Yes, it does.

Q. What are its functions? A. The Electric Home Bureau is an operation conducted by the Electrical League established in 1937, the functions of which are to contact from day to day architects, builders, contractors, kitchen equipment dealers, lighting dealers, and others engaged in the building and equipping of homes to educate them to the
1650 requirements of adequate lighting, promote the electrification of these homes for the complete use of electricity for all phases of the homemaker's job, not only refrigeration, cooking and lighting, but air-conditioning, both winter and where possible summer air-conditioning, the electric dishwasher, the electrical disposal unit for the kitchen sink,

—882—

well equipped laundries, adequate lighting throughout, the complete electrification of the home.

This effort requires the services of six field men under the direction of a Company employee who works with the

Electrical League. The efforts consist of frequent demonstrations and kitchen planning talks to these architects, building contractors and building owners, a consultation service with these on wiring plans.

An architect on the League staff assists with kitchen planning, and the effort in general is to make the provision early enough in the construction of the house to enable it to be an all-electric home.

The efforts are especially fruitful in dealing with apartment house owners and in the last few years of the apart- 1652
ments built or erected in the City of Cleveland and suburbs, none has been built without wiring for electric cooking and the all-electric kitchen, and only one of these has been installed without electric ranges in the kitchen, so that the program has been especially fruitful in the field of apartment houses, although the efforts are definitely tangible and the results satisfactory in individual home efforts.

In the individual homes, efforts are made to encourage the use of motor-driven blowers for the circulation of warm air in warm air furnaces, and the installation of coal stokers which are motor-driven. 1653

—883—

These efforts have been reasonably successful and resulted last year in the sale of motor-driven blower units in the number of 1,850, and of stokers more than 1,550. These results are definitely due to the efforts, we think, of the Electric Home Bureau.

Q. Is the service of the Electrical League addressed primarily to development of residential consumption? A. Yes, although to the extent I have indicated it has fostered commercial and industrial sales. However, the major efforts of

1654 *Elmer L. Lindseth—By Respondents—Direct*

the Company in commercial and industrial sales are made through direct commercial and power sales divisions of the Company's sales department.

Q. Rather than through the Electrical League? A. Rather than through the League.

Q. Could you describe the promotional policies of the Company with respect to commercial and industrial consumption? A. The power sales division of the sales department is under the direction of the supervisor of the Power
1655 Division, with fifteen men.

Cleveland is an industrial community and the prosperity of the Company in the past and the growth of the Company has been in large measure tied to the industrial and commercial development of the community.

Early efforts of the Company in power sales were largely

—884—

devoted to converting isolated power plants, so-called—those plants in which a small manufacturing enterprise did its own power generation—converting such plants to purchased power. Those efforts of the Company were very successful
1656 and the number of commercial and manufacturing establishments in the Company's territory now making all their power needs is only thirteen contrasted with this, that the Company has more than 1,800 large commercial and industrial customers.

In the early years of the efforts of this division, there was a widespread use of internal combustion engines due to low gas and oil prices. The Company, however, by using qualified engineers in its sales divisions and particularly the power section of the sales department, working in cooperation with these manufacturers with electric motor and

equipment manufacturers, with consulting engineers, was successful in educating its potential customers to the economies of purchased power.

Special attention was and is given to new industries where no power equipment or generating equipment at least is necessary to be displaced and where the opportunities for selling purchased power are, of course, easiest. There are, in the territory, still some opportunities for displacing some partially used power generating equipment, and a class of equipment described as mechanical drive where pumps or 1658
other machinery are now driven directly by a steam engine or a gasoline engine or other prime mover, so-called, which

—885—

is a potential load for the Company when converted to a motor drive.

In downtown Cleveland, in the office building district, where there have been, prior to 1930, at one time or another, seventy isolated power generating plants, the number of these generating all of their needs has been reduced to only one, and the number generating a portion of their needs is only three others. 1659

Q. Did some of these old plants which were in existence also provide steam on the premises on which they were located? A. Yes, and they are a sales problem requiring very careful analysis of the actual conditions prevailing. When both steam and electricity are required by the consumer, the economics of displacing the steam generation of electricity is not as clear-cut as in the case when steam demands are smaller, as a result of which the record of the Company in displacing such isolated plants in the hotel and downtown building district is the more impressive.

1660 Q. In furnishing current to one of these purchasers that previously used its own facilities for the generation of power, and also for steam generation, were you at times confronted with requests to establish steam service as well as electric service? A. Yes, and as a result of those requests, we did establish that central steam service for the downtown area of Cleveland for heating.

—886—

1661 The commercial efforts about which you inquired are handled by the commercial division of the sales department under a supervisor with twenty-three employees and his contract is largely with retail sales establishments, small stores, small offices, small shops, those whose use is less than twenty kilowatts of demand, and the number of such customers is 35,000.

The territory of the Company is divided into salesmen's districts, and these men are each assigned to a territory for whose customers they are responsible.

The average number of customers of the general commercial class served by each of these salesmen is about 1,600.

1662 The customers' needs for information as regards improved lighting, major appliances of a commercial nature such as commercial refrigeration in a grocery or a meat shop, cooking requirements in small restaurants, drug stores and similar places, those needs are served by the territory man in the retail commercial division.

Lighting there, too, is a very important effort in the sales program, since lighting as a tool for selling is coming into considerable prominence. Fluorescent lighting recently developed is one of the distinct opportunities for promotion

by commercial divisions as are the use of electric signs, spot lighting of merchandise, air-conditioning in those small spe-

—887—

cialty shops where air-conditioning can be sold, and similar load building activities and devices.

Q. Do you have a commercial division which handles the so-called commercial accounts? A. Yes. It is that division which I have described as the retail commercial division.

Q. Do you feel that the intensification of an industrial or a commercial promotional program results in definite 1664
advantages to the people located in your territory? A. Yes, and as evidenced by the very favorable response which the Company has received from its consumers, those efforts have been justified.

Q. In what respects do the people of the territory benefit by promotional activities in industry or among large, commercial consumers? A. To the extent that the Company is able to contribute to the reduction in costs required in the manufacture of a product, or the sale of a product, the Company then benefits that manufacturer or seller, and to the extent that that manufacturer is able to improve his 1665
business in the community, the general prosperity of the community is raised and the residential and all consumers benefit.

The specific benefits to residential consumers from such efforts of the Company as those of the Home Lighting Advisers and the home economists whose duty it is to assist the home-maker in the use of the electric range most espe-

—888—

cially in the planning of meals and the aiding in the design of electric kitchens, those intimate contacts in the houses

have brought many, many favorable comments to the Company from its consumers and this program, the Company has every reason to believe is well received by the community.

Q. What types of advertising do you engage in? A. The Company's advertising department, under an assistant to the President, directs not only the advertising by the Company over its own name described as direct advertising, but in addition, serves as consultant and adviser in the adver-
1667 tising arranged by the Electrical League, the so-called League advertising, and a very important third type of advertising carried on in cooperation with the dealers and to which the Company contributes a share of the cost known as cooperative advertising.

The direct advertising by the Company, in addition to newspaper or ordinary periodical advertising, includes the preparation of sales promotion booklets, pamphlets calling attention to particular efforts and particular appliances, and similar activities.

Q. Is advertising a rather expensive item of operations?
1668 A. Whether advertising is expensive must be judged by the results obtained. That the amount of money spent is great, is a correct observation, perhaps, but that it is expensive

is probably not a correct observation because the results received in the form of increased sales thereby resulting in reduced rates to consumers through reduction in costs, would cause me to say that the advertising promotion of the Company is not expensive.

In connection with the effort I described as cooperative advertising with dealers, the Company definitely stipulates

that the circumstances under which the Company will contribute to such advertising is that the dealer must advertise only merchandise of accepted quality, behind which the Company can stand.

The Company exercises this precaution in order that its efforts and its financing might not be used to promote the sale of shoddy merchandise in the community.

Q. Now, what have been the results of this promotional activity in addition to the specific instances you have already given? A. Reference to Exhibit No. 25 shows the increased 1670
use per residential consumer resulting from the promotional efforts and other factors over the last thirty years.

The efforts during the early period from 1910 to 1920 were substantially all devoted to just getting customers. As a result, the average use per consumer did not go up very rapidly because, as new consumers were attached to the lines, those were likely to be small, low-use consumers, and it will

be noted, for example, between 1912 and 1915 that the average use per customer actually went down during a period when the number of customers increased from 50,000 to about 1671
90,000.

Q. You don't feel, of course, do you, that the fact of increase is due solely to promotional activities? A. Well, the availability of appliances, of course, have contributed very substantially to this increased use, but in very large measure the increased use per residential consumer has resulted from the educational and promotional policies of the Company and of the industry.

The corresponding information for the general commercial customers may be seen from Exhibit 26, in which it is

1672 *Elmer L. Lindseth—By Respondents—Direct*

seen that between 1916 and 1939 the increase per customer has increased from about 1,300 to almost 4,000, a three-fold increase.

Q. Excuse me, did you say 1,300? A. Yes, 1,300.

Turning our attention to Exhibit 25 on residential consumption for the same period, namely 1916 to 1939, it is seen that the average use per residential customer has increased from 300 to 924, again a three-fold increase.

Since 1916, the trend of increased use per residential
1673 customer on an annual basis has been uninterruptedly upward with the single exception of 1933, when, as a result of the depression, the average use per customer in that year was actually lower than the year before.

—891—

Since the revival of effort on the part of the Company and its sales promotion policies which had been interrupted in the early period of the depression, and in substantial measure because of the inauguration of these very successful promotional activities, such as the "Better Light—Better Sight" program, the Electrical Home Bureau, the inaugura-
1674 tion of the Company's residential promotional division in 1934, that rate of increase from 1933 to 1939 is more rapid than that experienced during any other period of the Company's history, and it is further of significance, we think, that the rate of increase during 1940 is even more rapid than has been experienced in any of the previous years, and the increased use per residential consumer, this year, over last year, will be probably an all-time record increase.

Q. Would you refer to Exhibit 27? A. Yes.

Q. The curve shown for kilowatt hours per consumer is very irregular. Can you explain the irregularities? A. Yes.

This is quite an interesting exhibit in that it portrays not only the results of the promotional efforts on the part of the company, but indicates the widely fluctuating conditions resulting from a highly industrialized community.

For example, in 1929, the average use per customer of

—892—

this class was about 530,000 kilowatt hours per year. By 1932, as a result of the drastic contraction in industrial and business activity, that average use per industrial and large commercial customer, had declined to 330,000. 1676

The revival of activity then began, and by 1936 and 1937 this was substantially above the 1929 level and had reached about 560,000 or 570,000 kilowatt hours.

In 1938, there was a drastic reduction in activity. The average use declined to 450,000 kilowatt hours, but was restored again in 1939. The 1940 figure is again such as to indicate a new all-time high in the average use by these customers.

The Examiner: During the luncheon recess, counsel for the Respondents and counsel for the Commission indicated that they would like to have some 1677 time this afternoon to go through the record and look for corrections therein and I will now recess for that purpose for the rest of the afternoon.

We will continue tomorrow morning at 10:00 o'clock.

(Whereupon, at 3:45 o'clock p. m., the hearing was recessed until 10:00 o'clock a. m., August 8, 1940.)

—893—

1678 BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

1679 Hearing Room 1103,
Securities and Exchange Commission Building,
Washington, D. C.,
Thursday, August 8, 1940.

Met, pursuant to recess, at 10 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

1680 RALPH C. BINFORD,

ARTHUR J. BUSWELL, Attorneys for the Securities and Exchange Commission.

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York, N. Y., attorneys for the Respondents.

S. PEARCE BROWNING, JR., of Sullivan & Cromwell, 48 Wall Street, New York, N. Y., attorneys for the Respondents.

1681

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon, ELMER L. LINDSETH resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Lindseth, would you refer again to Respondents' Exhibit 24. Will you explain that exhibit further? A. I have described the significance of the lower three curves being electric production expense per kilowatt hour sold, electric operating expense per kilowatt hour sold, and the sum of the two indicated as the total electric operating expenses per kilowatt hour sold.

1682

The uppermost curve is the electric revenue received by the company per kilowatt hour sold, and shows a long time declining trend from 1921 to 1939, from 2.47 cents per kilowatt hour average revenue received in 1921 to 1.77 cents per kilowatt hour average revenue received in 1939.

This overall decline in revenue is thus seen to be 0.70 cents per kilowatt hour for the 18-year period.

1683

The corresponding decline in electric operating expenses during the same 18 years was slightly less than 0.60 cents per kilowatt hour, having been reduced from 1.28 cents per kilowatt hour in 1921 to 0.69 cents in 1939, a decline of .59

cents per kilowatt hour.

Thus it is seen that the overall reduction in revenue received per kilowatt hour, or the selling price, has been greater than the decline in the total operating expenses per kilowatt hour.

1684 Important components in the cost of selling energy, however, are present other than those shown on the diagram, namely, taxes and depreciation.

The fixed charges on investment are a major element in the cost of power. During the period shown on the exhibit, the investment required per dollar of gross revenue has increased substantially, that is from a value of $3 of investment—or fixed assets is better—required in 1921 per one dollar of gross revenue, and from this level the ratio has
1685 increased to a ratio of about $5 in 1939 of fixed assets required per one dollar of gross revenue.

But because of the trend in the number of kilowatt hours furnished per one dollar of gross revenue received, the investment in fixed assets required per kilowatt hour sold as of 1921 was 8.36 cents. And the corresponding figure as of 1939 was increased only to 8.54 cents. That is, within the limits of difference, it may be said that the investment required per kilowatt hour sold in 1939 was only slightly higher than the corresponding investment required in 1921.

Taxes per dollar of revenue have similarly increased at
1686 —896—
a very rapid rate during the 18 years being discussed, but again, because the number of kilowatt hours furnished per dollar of revenue received has very markedly increased, the resulting taxes per kilowatt hour sold have been maintained at a level on slightly below that prevailing 18 years ago.

The taxes per kilowatt hour sold in 1921 were .307 cents per kilowatt hour. The corresponding taxes in 1939 were .286 cents per kilowatt hour—a slight decrease.

The rate at which depreciation has been charged when related percentagewise to fixed assets is lower in recent

years than prevailed 18 years ago, but because of the compensating effects of the increase of investment fixed assets required per dollar of gross revenue, and the accompanying increase in the number of kilowatt hours sold per dollar of gross revenue, the two effects of these have yielded an investment slightly higher per kilowatt hour in 1939 than in 1921, and the depreciation charges today per kilowatt hour are substantially those of 18 years ago. The charge for 1939 was .223 cents. The corresponding figure for 1921 was .242 cents per kilowatt hour. 1688

Thus, fixed charges exclusive of return, that is taxes and depreciation, have decreased in the 18-year period by .040 cents per kilowatt hour or 4/10 of a mill.

Thus, it is seen that such fixed charges have not decreased in the 18-year period to the same extent at all as have oper-

ating expenses been reduced.

Since the reduction in revenue received per kilowatt hour exceeds the reduction in operating expenses per kilowatt hour for the 18-year period by an amount in excess of 1 mill per kilowatt hour, and during the same period the corresponding 1689 reductions in taxes and depreciation have been but 4/10 of a mill per kilowatt hour, the excess reduction in revenue above that accounted for by depreciation, taxes and operating expenses has come from the reduced return received on the investment required, which during the period has actually increased.

Mr. Hamilton: May this document be marked Respondents' Exhibit 29 for identification?

The Examiner: It will be so marked.

1690

(The document referred to was marked "Respondents' Exhibit 29 for identification.")

By Mr. Hamilton:

Q. Will you explain, Mr. Lindseth, what Respondents' Exhibit 29 for identification portrays? A. This shows for the Cleveland Electric Illuminating Company system the B. t. u. per kilowatt hour of net output record of performance of the power plant system from 1920 to 1939, inclusive,

1691

and the production expense in cents per kilowatt hour or net output for the period from 1911 to 1939 inclusive.

—898—

Q. This chart has been prepared under your supervision? A. Yes, it has.

Q. The facts shown are taken from the records of the company? A. Yes, sir; from the Statistical Department records.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 29.

1692

Mr. Binford: No objection.

The Examiner: It is received in evidence under that number.

(Respondents' Exhibit 29 was received in evidence.)

By Mr. Hamilton:

Q. Some of the facts shown, Mr. Lindseth, are those as to which you testified yesterday, particularly with reference to system B. t. u. Would you refer now to the exhibit and

explain the meaning of the term "net output?" A. In the generation of power, all of the electricity generated in the power plant is not available for delivery from the plant to the transmission and distribution systems, being required in part for the operation of auxiliaries, station lighting and other plant uses within the power plant itself. The amount of energy delivered from the power plant to the transmission and distribution systems, which is the aggregate or gross generation reduced by the amount of generation required

—899— 1694

within the power plants is referred to as "net power."

The production expense as shown on Exhibit 29 then is the production expense per kilowatt hour of such net output from the power plants.

Q. I note from the exhibit that system B. t. u. is shown only as far back as 1920, whereas production expense is shown back to 1911. Why is there a difference in the period shown? A. The difference arises from the availability of the data. Accurate records of plant performance expressed in more precise units of B. t. u. per kilowatt hour net are not available prior to 1920. Costs, however, are available over a much longer period. 1695

Q. Production expense as shown on this exhibit is not, for the reason that you have stated, completely comparable to electric production expense as shown on Exhibit 24, is that right? A. That is correct. The electric production expense as shown on Exhibit 24 is the electric production expense per kilowatt hour sold, and differs from the electric production expense per kilowatt hour of net output from the generating plants by virtue of the fact that all of the energy deliv-

1696 *Elmer L. Lindseth—By Respondents—Direct*

ered to the transmission system, or better perhaps delivered from the power plants is not available for ultimate sale to consumers, being in part lost through transformation, conversion, transmission and distribution losses, and in part

—900—

because of substantial amounts of such energy are used in company operations at sub-stations and other points on the system.

1697 On Exhibit 29, the curve shows a marked rise in production expense in 1920 as compared with relatively low levels in preceding years. Would you explain the abruptness of that rise? A. In the period prior to 1915 or 1916, the pre-war period for World War No. 1, the prices of coal did not for the 10 years between 1906 and 1915 ever reach as high a value as $2 per ton. The maximum, as a matter of fact, was $1.82. That first point shown on the diagram, 1911, the cost of coal per ton was $1.49. Wages and supplies were correspondingly low in cost.

1698 Shortly after the outbreak of the World War, and more especially in 1918, 1919, and during the post-war inflation of 1920 and 1921, the price of coal rose very rapidly. As of 1920, the point on the production expense curve which is a maximum, the average price of coal during the entire year was $5.77 per ton, and at times reached a level of $7 per ton.

The Examiner: Were these prices at the mines or delivered in Cleveland?

The Witness: These were prices delivered at Cleveland, and they are the price which goes into the price of the energy at the power plant.

—901—

Mr. Buswell: By the prices delivered at Cleveland, you mean prices at the respective plants of the company, Cleveland and elsewhere?

The Witness: Yes, that is correct.

By Mr. Hamilton:

Q. Although during that period, there was just one generating station, so it was delivery at the power plant? A. There were two.

The Examiner: They were delivered prices rather 1700
than at-the-mine prices?

The Witness: That is correct.

By Mr. Hamilton:

Q. Now, will you proceed? A. Hence, the decline in production expense per kilowatt hour as between 1920 and 1939 embodies more elements than merely that shown by the upper curve which represents the efficiency of generation but which represents the combined effect of fuel consumption, fuel cost per ton, labor, supplies and material costs, and the other components of production expense. 1701

It should be noted, however, in connection with the upper curve of improvements in system economy, that this shows a substantially uninterrupted trend for the 18 or 19 years shown. The only reversal was in 1937, caused by some extraordinary construction conditions on the system, requiring

the operation of relatively inefficient capacity during the periods of temporary construction.

During the period shown, there was substantial improvements in stations' equipment, in design and construction of

two modern power plants, but during the period such as between 1931 and 1937, when the improvement in the efficiency of power plant operation was 10 per cent., that is, the reduction in B. t. u. per kilowatt hour was from 16,600 in 1931 to 15,000 in 1937, this substantial improvement was achieved without the addition of new or efficient capacity, although in the early part of the period—1932—there was the removal of some relatively inefficient equipment from the Lake Shore plant.

1703 Q. What is the extent of the company's coverage of rural territory in the system? A. Reference to the portion of the territory served by the company, Exhibit 21 shows the extent of incorporated municipalities, and the extent of unincorporated areas in the company's total service territory. The cross-hatched sections of this exhibit are incorporated municipalities described in the company's records and in my testimony as urban, even though the population of some such incorporated villages is quite small.

Q. What is your definition of the term "rural" for pur-

1704 poses of this statement? A. Rural territory is territory outside of incorporated municipalities, and on Exhibit 21 shown here, the extent of rural territory served is about 1,150 square miles and the extent of urban territory is something over 500 square miles.

Q. In this rural territory which you spoke of, how much in terms of mileage do the company's lines traverse? A. In the rural territory, there are 2,200 miles of public highway. Of these, the company's lines now traverse 1,300 miles, or 60 per cent. This 60 per cent. of highway coverage brings the service facilities of the company available to 74 per cent.

of the potential rural customers in the entire territory. 61 per cent. of these potential rural customers are now served.

Q. Is the expansion in this territory a fairly constant one, in other words, progress is being made all the time? A. Yes. Line extensions or increases in the company's facilities are continuously being made. As of last year, for example, the increase in the miles of rural distribution lines or these highways traversed was 5 per cent., being 56 miles of additional distribution system in rural areas. These rural distribution facilities have been built substantially all by the 1706
company's construction, and of the aggregate number of customers in such areas, but 6 per cent. were acquired by pur-

chase by the utilities.

Q. So that the high coverage which has resulted has been primarily due to extension of your own facilities? A. Yes, that is correct.

Q. How does the number of persons served in this so-called rural area compare to the number of potential rural customers? A. The number of potential rural customers in the company's territory is estimated to be 26,500 under the 1707
conditions presently prevailing of the population in the district. The number of such potential customers now served is 16,225 or some 61 per cent. saturation of potential customers. Service is available to an estimated 19,600 of such rural customers, or 74 per cent. of the presently potential customers.

Q. Would you explain what you mean by "potential"? A. When referring to customers in the district, a house is considered, or a suite in an apartment, a store unit—any of these—is considered a potential customer. When he takes

1708 *Elmer L. Lindseth—By Respondents—Direct*

service from the company he becomes an actual customer. The aggregate figure then of 26,500 potential rural customers represents then the number of customers the company would now have were every person who might take energy in the district actually to do so.

Q. How does the number of farms in the territory actually served compare with the potential number of farm cus-

—905—

tomers in the territory? A. In connection with discussion
1709 of farms and farm customers, I would like to differentiate between the two, that is between the number of farms and the number of farm customers, since matters of definition are there involved.

There may be more than one customer per farm when on a given farm several houses are located, for example, each of which becomes a customer.

For the company's statistical record purposes, a farm is defined as a tract of land of 3 or more acres used mainly for agriculture, or one of less than 3 acres when the owner or tenant devotes his entire time to agriculture thereon.

1710 The farm then in rural territories, i.e., unincorporated territory, is a rural farm. A farm so defined in urban territory, that is an incorporated municipality, is described as an urban farm.

A farm customer is a customer located on a farm, and when as happens in the case of the Cleveland company, the number of farm customers actually exceeds the number of farms, statistical data are more reliable when related to farm customers.

In the case of the company as of the present time, the ratio between farm customers and farms is approximately

1½—that is, there are about 1½ farm customers per farm.

Within these definitions, then, the number of potential

—906—

farm customers in the rural areas served by the company is about 11,900 in the rural areas. The corresponding figures in the urban areas are 3,400 potential farm customers, an aggregate of 15,300 potential farm customers in the entire service area.

Service is now available to 9,600 of these potential farm customers, or 63 per cent. Because not all farms to which 1712
service is available actually utilize that service, the number of farm customers now served both rural and urban is 7,700, representing 50 per cent. of the total potential farm customers.

Q. And what percentage of those farm customers to whom the service is available? A. What is that?

Q. That is, this is a relation of your 7,700 figure to 9,600? A. Of the farm customers to whom service is actually available, 80 per cent. now avail themselves of that service and are customers of the company.

Q. Has the number of farm customers actually served 1713
shown a marked increase in recent years. A. In the 6-year period from 1933 to 1939, the number of farm customers, urban and rural, has increased from slightly over 6,000 to the 7,700 presently served, an increase of 27 per cent. During the same period, the number of rural customers served, farm and others, has increased from about 12,500 to about

—907—

16,225, an increase of 30 per cent. in the total rural customers served.

1714 *Elmer L. Lindseth—By Respondents—Direct*

Q. Now, would you relate if you can, the increase in distribution lines in these rural territories for the same period? A. As of this period from 1933 to 1939 during which the number of rural customers has increased 30 per cent. and the number of farm customers, urban and rural, has increased 27 per cent., the required distribution line to serve these customers has increased more rapidly than either and has increased 38 per cent. in the period.

Q. And in terms of actual mileage added, what are the
1715 figures? A. The actual miles of rural distribution line as of 1933 was 950. The corresponding mileage of rural distribution as of 1939 was slightly over 1,300. The increase then is about 350 miles of rural distribution line increases in the period.

Mr. Buswell: Is this increase located in any one particular section which you serve, or is it general in your rural sections served?

The Witness: It may properly be said that this increase is quite general, since it represents the aggre-
1716 gate of a very large number of rather small jobs, but due to the economic aspects of the problem, namely, that the rural line extensions are paid for in part

or at least part of their cost contributed to by the consumer in the more prosperous areas, and those adjacent to the built-up sections, the line extensions are likely to be more rapid. The number of line extension jobs last year, of rural line extensions, was 250 individual extensions, and since the average line extension serves about 3.1 customers, the number of

additional rural customers to whom service was made available and who took that service was about 750 last year. Since 1936, about the last three or four years, there have been 1,020 such individual construction jobs.

Q. The figures which you have given then are the system figures? A. The data are in all cases system figures.

Q. And are to be related, of course, to the territory shown on Exhibit 21? A. That is right. 1718

Q. Do you feel that the company's line extension policies in rural territory have been favorable to the consumer? A. These line extension policies have been favorably received by the consumers. The consumers are at a reasonably progressive rate taking service from the company, and there is nowhere in the company's territory any R. E. A. required for the service of rural or farm customers. The facilities of the Company in all cases have been utilized.

—909—

Q. What do you mean by "R. E. A."? A. Rural Electrification Administration. 1719

Q. Project. A. Project. The present line extension schedules of the company enable these potential farm or potential rural customers to receive a service at reasonable cost. The company's first line extension schedules became effective in 1917 under which an applicant deposited with the company the estimated cost of the line extension and was entitled to refunds as other customers were connected to the lines, at the rate of $20 for each of such customers connected.

Although the details of this plan have changed somewhat in the 23 years since the plan was inaugurated, the present plan of line extensions embodies the fundamental principles which have prevailed since the beginning, namely, that the applicant for service deposits with the company an amount toward the cost of the extension which is determined in accordance with the schedules filed, and second, that as additional customers are added to the lines, or as the lines are used for transmission or street lighting facilities, that re-
1721 funds are made to the depositor in accordance with filed schedules.

The present schedule applicable to rural line extensions has been in force about 4 years. This schedule permits an applicant for service in rural areas a free extension when the length of line required does not exceed 200 feet. When

the facilities required exceed 200 feet, the consumer or the applicant deposits with the company an amount towards the cost of construction equal to $25 per 200 feet of pole line required in excess of the free extension.

1722 For example, if an applicant for service requires line construction in an amount of 600 feet, he is entitled to 200 feet free and would thus make a deposit of $50 towards the cost of the line construction. Under a refund provision, however, should another applicant between the first applicant and the last point of service of the company request service, the company would then make a $25 refund to the original depositor because of the acquisition of a second customer, making the total amount on deposit $25; and this $25 would then be divided between the two applicants, and each would then have on deposit with the company $12.50.

1723

In the event that a third customer would make application in the area on this line extension, the last $25 of deposit would be refunded to the consumers, and the facilities would then have been built entirely at the cost of the company and all deposits refunded.

In considering the cost of such line extension schedules, the rates under which the consumer is served should be given consideration, and it should be noted in this connection that such rural consumers, regardless of their location, are served

—911—

1724

at precisely the same rates that residential consumers are served at anywhere in the territory, whether city or rural.

Q. Is there an optional schedule available to rural customers on extensions? A. Yes, sir; such an optional schedule filed with the Public Utilities Commission in accordance with a plan whereby the consumer does not make deposits with the company for the line construction but pays an amount monthly as a minimum bill, which is 2 per cent. of the estimated cost of the line. No customer or no applicant of the company has elected to be served under this optional schedule. All of them have elected to take so-called rural line extension schedule under which deposits are made.

1725

Q. In recent years what has been the average number of extensions per year in rural territory? A. The average is about 250 per year.

Q. For what period? A. For the last three or four years, since 1936.

Q. And how many customers per extension have been added through this means? A. The average number of customers per line extension job is about 3.

1726 *Elmer L. Lindseth—By Respondents—Direct*

Q. And how is that number of extensions distributed throughout the territory? A. More than half are in the 3 counties of Ashtabula, Lake, and Geauga.

—912—

Q. Approximately what number? A. 550.

Q. During the period you have referred to? A. Since 1936.

Q. Out of a total of how many? A. Out of a total of 1,020.

1727

Q. Throughout the system? A. Throughout the system.

Q. What have been the effects of promotional policies in maintaining load or getting load requirements in the rural territory? A. Since 1926, the company has followed a policy of vigorous rural load promotion of an educational character primarily to make available to farmers and other rural customers adequate information as to the availability of equipment, water pumping systems and the like for the consumption of energy. These promotion programs have included, for example, display tents at county fairs for the

1728

cooperative display of merchandise with local dealers and merchants.

The electric farm equipment has been very definitely improved in recent years, and load growth in the company's rural area has been rapid.

There have been in addition to these cooperative displays, programs presented on electrical subjects at farmer insti-

—913—

tute meetings, meetings of the Grange, and at the county fairs, and during a portion of the period from 1934 to 1937, the company circulated among approximately 1,000 custom-

ers, a magazine "Electricity On The Farm," and during the next year another magazine "The Electric Ruralist."

The company in rural territories maintains sales representatives, territory men so-called, who have an adequate familiarity with electrical equipment such as brooders, poultry water heaters, soil heating equipment, feeder grinders, and other farm equipment, as well as residential equipment.

Q. Have these promotional policies resulted in increased consumption in rural territory? A. Specific data are not 1730
available for the rural territory alone, but for the portion of the system roughly to the east of Cuyahoga County, made up of 16,000 rural customers and about that many urban customers, the average use per residential consumer is as of the end of June, 1940, 1,063 kilowatt hours per consumer. This compares with a corresponding figure for the portion of the system made up roughly of Cuyahoga County and a small part of Lake County for which the average used was 950 kilowatt hours per customer, indicating that the average use in the eastern portion of the system is about 10 or 11 per cent. in excess of the average use among residential 1731
consumers in the territory shown as Cleveland and suburbs on Exhibit 21.

—914—

Q. What is the company's present rate structure? A. The company's present rate structure is one in which there are a number of schedules available to various classes of consumers in accordance with the character of the use required by the customers.

For example, there is available a residential schedule. A single residential schedule is not only available to, but

is used by all residential consumers throughout the territory, but a single schedule suffices.

For general commercial customers or small consumers of a commercial nature using less than 20 kilowatts of demand per month, there are but two schedules required,—one for alternating current service throughout the territory, and a second for direct current service in the limited downtown area of Cleveland in which direct current service is available.

The vast majority of the large commercial and industrial
1733 customers, that is those whose demand exceeds 20 kilowatts per month, for 1,200 or more of such customers, but 5 schedules are applicable throughout the range of the size and service conditions for alternating and direct current service for off peak and for special guaranteed load factor.

This simplicity of schedules also extends to the demand billing requirements of the schedule, and the demand billing requirements are favorable to the customer, and billing demands are on a one hour basis. The average of 4 weekly one hour demands being the monthly billing demand without

—915—

1734 correction or alteration for previous peak loads experienced or encountered.

Q. What are the rates actually charged a residential customer as of this date? A. The present residential schedule is 35 kilowatt hours per month at 4 cents per kilowatt hour. The next 65 kilowatt hours per month at 3 cents per kilowatt hour. The next 150 kilowatt hours per month at 2¼ cents per kilowatt hour, and the excess over 250 kilowatt hours per month at 1½ cents per kilowatt hour. The minimum bill is 60 cents included in which are 15 kilowatt hours.

Q. There are no discounts or penalties? A. There is neither a discount nor a penalty.

1735

Q. Are all of the schedules of rates to which you have referred uniform throughout the entire territory? A. Within the conditions of the availability of the service, the territory is served in its entirety by a single set of rate schedules. The direct current is available in only a limited area, 1¼ square miles in downtown Cleveland, but alternating current is available throughout the territory, and the rates for this service are uniform throughout.

Q. So that a resident of Ashtabula pays precisely the same amount for the same number of kilowatt hours used as does a resident residing in the center of the public square of Cleveland, if there were such a person. A. That is correct.

1736

—916—

Mr. Buswell: Provided he receives service from your company?

The Witness: Yes, that is right. We have control over the rates only over our own customers.

By Mr. Hamilton:

Q. Under the illustrations I have used, there would be no other possibility of service? A. Yes, there would be on the public square of downtown Cleveland.

1737

Q. I believe you spoke yesterday of the importance of promoting industrial load in the territory. Does the increase of industrial load have definite economic bearing on the prosperity of the community? A. Well, in a community in which industrial requirements are so important a part of the company's total service, the importance of industrial and commercial rates cannot be overlooked. The company has long maintained a policy of balanced rate structure between the

1738 *Elmer L. Lindseth—By Respondents—Direct*

several classes of service, such as residential, general and commercial and industrial consumers.

In the belief that it is vital to the welfare of the community that there be maintained such a proper balance, residential electric rates receive an amount of attention out

—917—

of all proportion to their true importance. It is extremely vital to an industrial community of the type served by the company that the rates for industry and commercial en-
1739 terprises be such as to promote new industries moving into the territory, to promote the retention of industries already there, and that the residential rates not be made so low as to hamper the industrial and commercial development of the community by requiring inordinately high industry and commercial rates.

The company has long recognized this situation, and throughout its history has maintained industrial and commercial rates not only so attractive as to induce business into the community, but so attractive as to virtually eliminate isolated generating plants in the territory. It is only in an
1740 extraordinary case in which it proves economical for a potential consumer of the company to generate its own power.

Q. What has the company's record been with respect to rate reductions? A. Since 1920, the company has made 7 voluntary rate reductions in its residential schedules; 6 in its general commercial schedules; and 7 in its large commercial and industrial schedules. Throughout its history, the company has followed a practice of making voluntary rate reductions, and there has been only one rate required to be fixed by the Public Utilities Commission of Ohio as the result of an appeal by the company, and in this case the

—918—

rates previously in effect by the company were determined by the Commission to be fair and reasonable.

Q. When was that? A. That was in 1919 and 1920—the beginning of this period I speak of. The most recent general reduction in rates made by the company was effective only 4 weeks ago—on July 7, 1940, when the company reduced its rates to customers throughout the territory in an amount of $1,400,000 per year.

Q. How was that figure derived? A. The figure for the estimated reduction is based on the application of the new 1742
rate schedules to the actual amount of business which the company did in 1939, so that more properly it should be said that rate reductions were put into effect on July 7 in the form of new schedules which when applied to the business done in 1939 would result in a reduction of $1,400,000. Since the volume of business being done and expected to be done in 1940 will exceed that of 1939, the reduction applicable to 1940 level of business will be in excess of the $1,400,000.

The Examiner: We will have a short recess.

(Whereupon, a short recess was taken after 1743
which the hearing was resumed.)

The Examiner: You may proceed, Mr. Hamilton.

By Mr. Hamilton:

Q. You were speaking of the effect of the recent rate reduction on revenues of the Company. How do the new rate schedules which have been filed or which were in effect pursuant to the rate reduction compare with those in effect

1744 prior thereto? A. The reduction in rates for residential consumers, computed on the basis of the energy used as of 1939, amounts to $840,000.00 out of a total reduction of $1,400,000.00. This reduction is accomplished by a reduction to the new rate schedule to which I just testified from the former rate schedule which was 50 kilowatt hours at four cents per kilowatt hour, one hundred kilowatt hours at 2¾ cents per kilowatt hour, and the excess over two hundred kilowatt hours at 1½ cents per kilowatt hour.

1745 The minimum bill remained unchanged at 60 cents.

Q. Can you translate that reduction in terms of annual bills to the residential customer? A. The average revenue received per residential consumer in 1939 was $33.15. Computed under the new rate schedule which became effective on July 7, 1940, the corresponding annual revenue per customer would be about $3.00 per year less. It is expected, however, that because of the increased consumption to be realized per residential consumer in 1940, and because of the

—920—

fact that the recently effective rate reduction is applicable
1746 only to the last half of 1940, the average revenue received per residential consumer or the average annual total of bills paid per residential consumer, will not be $3.00 less than the $33.15 average for last year, but is likely to be reduced substantially less than the $3.00.

Q. On the basis of increased consumption? A. In part, and on the basis of the fact that the rate reduction is applicable only through the last half of the year.

Q. What has been the Company's record on increase of average residential consumption? A. Reference to Exhibit 25 will show that the average annual use per residential con-

1747

sumer has shown, with only the single exception of 1933, a continuous increase over the last twenty-three years from 1916 to 1939, inclusive.

During 1940 to date, the rate of increase is even more marked than shown during the year 1939, and the trend for 1940 will be again markedly upward. The average use as of the end of 1939 was 924 kilowatt hours per consumer and as of June 30, 1940, this figure was 960 kilowatt hours per consumer.

1748

Mr. Buswell: That isn't shown on the Exhibit?

The Witness: That is not shown on the Exhibit. The revenue received per residential consumer in the amount of $33.15 for the year 1939 was at an all-time high with the possible exception of the period prior

—921—

to 1905 for which I do not have data available.

For the period at least from 1905 to 1939, the revenue received per residential consumer in the amount of $33.15 was an all-time high.

1749

By Mr. Hamilton:

Q. Has the average consumption of general commercial customers shown a corresponding increase? A. The corresponding data for general commercial customers are not so regular, being more susceptible to variations in business activity.

Reference to Exhibit 26 reveals a very rapid increase in average use per general commercial customer from 1927 to 1929, a very slight increase to 1930, no increase during 1931, and a drastic decline to 1933, following which there was a sharp recovery to a new high in 1936.

1750 *Elmer L. Lindseth—By Respondents—Direct*

The data are not strictly comparable throughout the entire period, due to the fact that in 1937 there was a reclassification of customers with the addition of certain customers theretofore classed as residential and thereafter classed as general commercial which were smaller consumers than the average of general commercial customers, resulting in some slight distortion in later years, particularly '37, '38 and '39.

The effect, from a long-range viewpoint, however, is for increased average use per general commercial customer.

1751 —922—

Q. The reclassification of which you have spoken accounts in part, at least, for the drop shown in the curve for the period 1937-38? A. Yes, in part due to reclassification and in part due to the drastic curtailment of business activity in 1938.

Q. What has been the Company's record with respect to increase in average large commercial and industrial consumption? A. This has been subject to even more violent fluctuations than that of the general commercial customers and is shown on Exhibit 27, the curve bearing the legend

1752 "Kilowatt hours per consumer."

Here is indicated the marked effect of the recession in business during 1938 and the drastic decline during the years 1931, '32, and '33.

Mr. Buswell: And '33?

The Witness: Well, 1933 showed a recovery from 1932, but was still at quite a low level of average use per consumer, being actually less than 1931 and lower than any of the years other than '32 between 1928 and 1939.

By Mr. Hamilton:

Q. Would you refer now to Respondents' Exhibit No. 28 which sets forth certain figures as to average net billings for residential consumers, and would you explain the legend shown in the right-hand corner of the chart bearing the references "A" and "B"? A. This chart shows for three use

brackets; namely, twenty kilowatt hours per month, fifty kilowatt hours per month, and one hundred kilowatt hours 1754
per month, the monthly bill incurred by the consumer.

The note referring to the hours of daily use is applicable to the bills prior to 1919, during which there were in effect rate schedules of the Company under which the charge per kilowatt hour was based on the hours of use or rate of demand, using the upper curve, the one hundred kilowatt hours based on five hours daily use of his demand, the monthly bill would be that shown by the lower curve or the "B" curve.

Should that customer, however, have used one hundred kilowatt hours as a result of shorter use, three and a half 1755
hours per day, of a higher demand, his bill would have been the higher one represented by curve "A".

Since 1919 such rate schedules have not been in effect and under the schedules in effect during the past twenty years, the consumption of one hundred kilowatt hours by a consumer is at a fixed bill regardless of the demand incurred by that customer.

The block type of line indicates the frequency and extent of rate reductions afforded the consumers of the Company

during the period of the diagram which covers the last twenty years.

—924—

About one-half of the Company's customers use an amount of energy which in the average is that shown by the middle curve, fifty kilowatt hours per month, and it is seen that as of 1920 the bill for this amount of energy was about $3.35. But, in accordance with the Company's recent rate reduction put into effect on July 7 of this year, the new rate
1757 for the corresponding amount of energy used is $1.86.

Similarly, for the larger user whose monthly consumption is one hundred kilowatt hours, and under the most severe conditions shown by curve "A" based on three and a half hours daily use, the bill for this amount of energy in 1919 prior to the rate reduction was about $6.70.

The corresponding figure today, recognizing the effect of the recent rate reduction, is $3.35, a cut to exactly one-half of the bill for twenty years ago, or twenty-one years ago.

Q. This exhibit, then, gives effect to the new rates and
1758 rules now in operation? A. It does, by being extended through the year 1940 to 1941, it being expected that no further changes in the Company's rate schedules will be made during 1940.

That, perhaps, should be a dotted line to show that it is strictly a projection into the future.

Q. Has the Company ever increased its residential rates? A. No, residential rates have not been increased.

—925—

Q. Have there ever been increases in other classes of service? A. Yes. During the period of very rapid increase

1759

in coal and other costs, during the period of the World War and immediately following, about which I testified in connection with Exhibit 29 on production expense, during that period it was necessary for the Company to increase its large commercial and industrial schedules and its general commercial rates.

Just before the full impact of war conditions was felt on the Company's economy in 1915, a rather drastic reduction in rates was put into effect for general commercial rates which required, in 1917, a rate increase as a result of the extraordinary rapid increase in costs.

1760

Correspondingly, in large commercial and industrial rates such increases were made in 1917 and in 1920, both resulting from the same unprecedented increases in the costs resulting from war. The rate increases were only temporary, however, and by 1924, the trend in voluntary rate reductions was again resumed and has continued in its progress toward lower costs for the consumers since that date.

Q. You have testified previously as to the comparative absence in the territory of industrial or other units which manufacture power for their own use. Can you illustrate that statement? A. Based on a survey made by the Com-

1761

pany, the number of the so-called isolated plants, commercial and industrial, in seventeen hundred square miles of territory which generate all of their own power needs, is but thirteen.

This is less than one per cent. of the number of large commercial and industrial customers of all classes which the Company now serves.

1762 *Elmer L. Lindseth—By Respondents—Direct*

In the territory, among the Company's customers, there are thirty additional large commercial and industrial establishments who generate a part of their electric needs. This is about two per cent. of the Company's customers of this class. This is rather effective indication of the reasonableness of the Company's rates for this class of service when shown by the lack of competitive industrial supply through isolated plants.

Q. Are your rate schedules filed with the Public Utilities
1763 Commission of Ohio? A. Yes. Since 1911, the Company has filed rates applicable to general classes of consumers such as residential, general commercial, large commercial and industrial, with the Commission and they have been approved for filing in every case.

Q. By the Commission or its predecessor Commission? A. That is right.

Q. Is the Company subject to regulation by the Public

1764 Utilities Commission of Ohio? A. Yes. The Company is regulated by the Public Utilities Commission of Ohio.

Q. Is it also subject to regulation as to rates by municipalities in the territory served? A. Yes. The Company is under the dual control of both the municipalities in matters of rates and the Public Utilities Commission.

For example, the recent rate reductions put into effect on July 7, 1940, were the result of negotiations between the Company and the City of Cleveland, which grew out of an investigation of the Company's business made by engineers

1765

employed by the City during the years 1938 and '39. Following the report of the engineers for the City to the Council, the City Council for the City of Cleveland, there was passed an ordinance by the Council fixing a maximum rate to be charged for electricity in the City of Cleveland.

This was appealed by the Company to the Public Utilities Commission because the Company felt that the rates were not reasonable. As a result of the appeal by the Company, the Public Utilities Commission ordered an inventory and appraisal of the portion of the Company's property devoted to the service of the City of Cleveland, which inventory was begun by the Company under the supervision and jurisdiction of the Commission.

1766

—928—

Prior to adjudication of the case, however, the City passed an ordinance acceptable to the Company and the case was thereby terminated.

The Company's operations, then, in matters of rates, as illustrated by this example, are under the dual control of the Council for the City of Cleveland, in the City of Cleveland, and the corresponding councils of all municipalities in which the Company serves, which are more than eighty in number, and in addition by the Public Utilities Commission of the State which has control not only of rates, but numerous other phases of the Company's business.

1767

Q. In the first instance, then, in municipalities, the question of rates is a matter of regulation by the local munic-

1768 ipality? A. That is correct, under the principle described as "Home Rule" for those municipalities.

Q. For how long a period has the regulation by the Commission of the Company's rates been operative? A. The Company filed its first schedules with the Public Service Commission of Ohio in 1911, June of 1911, since regulation has been begun by the State in 1911 through the then Public Service Commission, which had succeeded the Railroad Commission of Ohio.

1769 Q. When was the present Public Utilities Commission of Ohio constituted? By that I mean, not in personnel, but

rather in statutory basis? A. In 1913.

Q. How is the Public Utilities Commission constituted? What are its departments, and so forth? A. The Commission now consists of three commissioners, a secretary, assistant secretary, chief engineer, and a large staff of engineers, auditors and accountants.

1770 Q. Has the Commission prescribed a classification of accounts to which the Company is subject? A. The uniform classification of accounts followed by the Company was prescribed by the Commission and became effective January 1, 1915. This has been used substantially unchanged, except in detail, during these twenty-five years.

Q. Other than with respect to rates, what other phases of the Company's operations are subject to regulation by the Commission? A. I am speaking now only of electric service. A. The Company is regulated in matters of accounting by having prescribed the Uniform Classification of

1771

Accounts by the Commission. The Company is regulated in matters of security issue by requiring authority from the Commission for the issuance of such securities.

The Company is regulated in matters of service by being under the jurisdiction of the Commission in matters involving the adequacy of service and similar phases of the service problems encountered in the electric business.

—930—

Q. Do you file with the Commission records of property additions and property retirements? A. Yes. Such records are filed with the Commission twice a year.

1772

Q. How extensive are those reports? A. These reports have been filed with the Commission as a continuance of the property record initially filed as of July 1, 1914, in very complete detail. These records show all additions and retirements of the Company's property at the exact cost at which these are recorded in the books of account of the Company.

The records are called "betterment records" so-called, and they are virtually copies of the Company's fixed asset books. For example, last year, the filing of the additions to the property accounts of the Company required six volumes totaling 2,074 pages, and in retirements required four volumes totaling 1,155 pages.

1773

Q. Does the Commission pass on acquisitions of property by the Company? A. Yes. In all cases when property has been acquired by purchase from another public utility, the Company has obtained from the Commission approval both of the purchase and approval of the value at which the properties so acquired were recorded on the fixed asset books of the Company.

1774 The value at which such purchased properties have been

—931—

capitalized have been those determined by a detailed inventory and appraisal of such purchased property under order from the Public Utilities Commission.

A total of seventeen such applications for consent to purchase electric utility property from private and public utilities have been made by the Company and granted by the Commission, the first of them on January 4, 1913.

1775 Q. You have spoken of the jurisdiction of the Public Utilities Commission over the issuance of securities. How many applications for authority to issue securities have been made to the Public Utilities Commission? A. There have been a total of twenty-four such applications to issue securities granted by the Commission, the first of them December 11, 1911.

Q. And the most recent application? A. The most recent application for the issuance of securities was granted on July 3, 1940, when the Company received from the Public Utilities Commission of Ohio authority for the issuance of

1776 the $50,000,000.00 amount of 3 per cent. thirty-year bonds which were recently sold by the Company.

In connection with the issuance of these, specific requirements were laid down by the Public Utilities Commission of Ohio regarding the minimum price and the accounting procedure to be followed in amortizing the call premium and expense on the refunded issue, and the amortization of the premium received, less the expense of issue on the re-

—932—

funding issue.

Q. Do you get authority from the Commission to capitalize expenditures? A. In order to capitalize expenditures for property additions, the Company requires authority from the Commission for such right to capitalize.

—933—

Q. Do you make annual reports to the Commission? In order to make it clear to what Commission I am referring, my questions are addressed to the Public Utilities Commission of Ohio. A. The Company makes a comprehensive annual report to the Public Utilities Commission. This 1778
report includes all additions to and retirements from fixed asset accounts during the year, notes and accounts receivable, and all items of operating and non-operating revenue and expense in accordance with the Commission's prescribed Uniform Classification of Accounts.

The annual report also lists in detail the ownership and control of the Company, the names, addresses and voting power of the largest security holders and similar information. The report itemizes by accounts the plant additions to which I have referred, records the schedules of dividends paid, interest and other items of similar nature. 1779

The report further indicates contracts and agreements entered into, the amounts of electrical energy sold to or purchased from other utilities, numerous items of similar information applicable to the year's operations. The report in its entirety comprises 62 pages.

Q. Does the Company conform with the Commission's requirements with respect to service and complaints as to service? A. The Company very definitely does. Occasionally inquiries are made to the Commission as informal inquiries from customers or applicants for service regarding

—934—

1780 the Company's service, its rates, line extensions or other phases of its operation. Applicants or customers are free at any time to make inquiry to the Commission, or to make complaint were such complaint to be justified, in the matters of service, rates and schedule conditions.

When the Commission receives such inquiry regarding rates or conditions of service these are passed on to the Company by the Commission for adjustment with the customer or applicant and reply made to the Commission. In the last
1781 five and one-half years the files of the Company indicate that there have been a total of 50 such communications from the Commission to the Company classified as inquiries on rates and service and the like.

Most of these relate to line extensions in rural areas. All have been satisfactorily adjusted as between the Company and the customers and the Commission. The extent to which such inquiries are made is evidenced by an analysis of these 50 inquiries as follows: 32 related to line extensions; seven related to rate inquiries; four related to billing, over-charges or refunds; two related to the combined metering of several
1782 services; two related to the cost of a service connection; one related to a problem of installation; one related to an application for three-phase service; and, one related to information requested in regard to the Power Company's responsibility to the customer.

—935—

Q. These inquiries were called to the attention of the Company for action? A. In every case these inquiries had come first to the Commission and then had been called to the Company's attention by the Commission with the request that the matter be handled with the consumer and the Com-

mission advised of the disposition of the inquiry. This, in all cases, was done.

Q. Does the fact of the voting stock control of the Company by the North American Company restrict or obstruct the effectiveness of the regulation of the Company by the Public Utilities Commission of Ohio?

Mr. Binford: Objected to as calling for purely an opinion of the witness, upon no point in the scope of his qualification in the record here as an expert witness. It is purely a conclusion and not a matter of fact. 1784

Mr. Hamilton: From your experience as to the regulation of the Company by the Commission, can you answer that question, Mr. Lindseth?

Mr. Binford: Same objection, even if the witness answers that he is qualified and can answer the question.

The Examiner: Well, in that last question he asked him only if he could answer the question.

Mr. Binford: I don't think any answer would be competent when it calls for a personal opinion. It is not even a subject for an expert opinion. 1785

—936—

Mr. Hamilton: I think the record shows clearly the witness' complete familiarity with the business of the Company, the scope of its operations, etc.

The Examiner: I overrule the second objection. The first one still stands.

The Witness: Will you repeat the question then, please? Read it back.

Mr. Hamilton: Off the record, please.

1786 *Colloquy*

(Discussion off the record.)

The Examiner: The matter still stands without disposition. Will you read the second question where he asked the witness if he knew?

(Question indicated was read back.)

Mr. Hamilton: My second question, Mr. Examiner, in effect restricts the original question to his knowledge.

1787 The Examiner: Now, do you know the answer to the first question that was propounded to you?

Mr. Hamilton: As restricted, as I understand it, by my second question.

The Examiner: Yes.

The Witness: As restricted to my experience?

(Second question read back.)

Mr. Binford: I will ta' an exception to the ruling and object to that question.

The Examiner: All right.

—937—

1788 The Witness: Will you read back the first question then, which, within my experience, I am to answer?

(Question indicated read back.)

The Witness: The answer is "Yes, I can."

The Examiner: Now, do you still object to the question as restricted by counsel since your original objection?

Mr. Binford: Yes, sir, most assuredly. There is no showing that this gentleman is a member of or has

ever been a member of the staff of the Ohio Commission or knows anything about whether its activities are affected in any way, shape, manner or form by any outside factors.

Mr. Hamilton: It is obvious, Mr. Examiner, that the answer to the question has two approaches. One is definitely the approach as an executive of the Company, and it is also obvious that any answer Mr. Lindseth may make can only be made as an executive of the Company. 1790

Mr. Binford: It is furthermore obvious, I think, Mr. Examiner, that it can call for nothing but a purely personal opinion of the witness. Even if such an opinion might be proper, which I don't admit it is, no proper predicate has been laid for it by the mere answer "Yes" to the previous question.

Mr. Hamilton: Off the record, please.

(Discussion off the record.)

The Examiner: Since we are not operating under strict rules of evidence and since this witness has 1791 exhibited quite a familiarity with the affairs of this

Company in an official position, and since he says from his own experience he can answer the question, I will overrule the objection.

Mr. Binford: Exception.

Mr. Hamilton: Now, will you read back the original question which, as I understand, the witness is to be permitted to answer?

The Examiner: Yes, that is right.

(Question indicated read back.)

The Witness: It does not.

By Mr. Hamilton:

Q. I believe you previously testified, Mr. Lindseth, that the Company has two subsidiaries. Will you state their names again, please? A. The names of these are The Power and Light Building Company, and The CEICO Company.

1793 Q. What does The Power and Light Building Company do? A. The Power and Light Building Company holds title to the 15-story office building occupied by the Cleveland Electric Illuminating Company at 75 Public Square, Cleveland.

Q. Its only business then is the ownership and maintenance of this building? A. Its only business is the ownership of this building, without the maintenance thereof. The Power and Light Building Company rents this building to the Cleveland Electric Illuminating Company, who, as tenant, operates and maintains the building.

—939—

1794 Q. Has The Power and Light Building Company any employees? A. There are no employees of The Power and Light Building Company. Its officers are officers or employees of the Cleveland Electric Illuminating Company.

Q. Why was The Power and Light Building Company organized in the first instance? A. When the building was built in 1913 and 1914 its size was such that the Cleveland Electric Illuminating Company did not expect to occupy all floors. As a matter of fact, the building was initially

occupied only to the extent of six floors by the Company. The rest of the space was rented to commercial tenants.

The Cleveland Electric Illuminating Company then, were it to have held title to the building, would have been in a non-utility business by renting such space, and the subsidiary company, The Power and Light Building Company, was organized to perform such real estate and renting functions. Gradually the Cleveland Electric Illuminating Company increased its occupancy until in 1923 it took over the entire building. 1796

Charter provisions of the Cleveland Electric Illuminating Company precluded it from being in the real estate rental business of this general office building as of the time of the construction

Q. Where is this building you speak of? A. The building is located at 75 Public Square Building, Cleveland.

—940—

Q. This is the main office building of the Cleveland Electric Illuminating Company, is it? A. It is.

Q. Is it now entirely occupied by the Cleveland Electric Illuminating Company? A. It is now entirely occupied by the Cleveland Electric Illuminating Company, for which the Cleveland Electric Illuminating Company pays rent to The Power and Light Building Company in the amount of $40,000 per year, which amount is sufficient to pay taxes, insurance, and depreciation. The Cleveland Electric Illuminating Company pays the operating expenses. 1797

Q. What are the assets of The Power and Light Building Company? A. The assets of The Power and Light Building Company are the building, itself, and the land, plus cash

1798 *Elmer L. Lindseth—By Respondents—Direct*

in an amount of $117,000, a small amount of interest receivable, certain balances in liquidating banks' and creditors' notes in the amount of $12,000, and about $1,000 of prepaid accounts and deferred charges. The aggregate of such assets totals $1,233,000 as of December 31, 1939.

Q. And its income statement shows what as net income for the period ended December 31, 1939? A. Surplus, after insurance, taxes and depreciation have been paid out of rentals and miscellaneous income, in the amount of $1,155

1799 at December 31, 1939.

Q. That, then, is the net income figure? A. That is. I overlooked, perhaps, in the description of this building, that it is occupied in the basement and a part of the first and second floors by a direct current sub-station of the Cleveland Electric Illuminating Company, containing rotary converters, transformers, buses and the necessary switching and control equipment associated with a direct current sub-station.

1800 Q. Are the officers of The Power and Light Building Company paid any salaries? A. They are not.

Q. Why was The CEICO Company formed? A. The CEICO Company at its formation performed a meter servicing, maintenance and installation function for customers of the Company who——

Q. If you will pardon me, I think since we are referring to several companies at this point we had better identify them specifically by name. A. The services to which I have referred as having been performed by The CEICO Company

were performed for customers of the Cleveland Electric Illuminating Company who owned office buildings or other buildings in which energy was purchased wholesale from the Company for sub-metering and resale to tenants.

Q. What is the business of The CEICO Company at this time? A. The CEICO Company services, repairs and reads about 3,250 sub-meters located in 42 buildings, the owners

—942—

of which have neither the personnel nor the facilities to keep 1802
these sub-meters within commercial accuracy or to perform the otherwise necessary operations in connection with the resale of current. For several years only one man has been employed and at certain times between meter-reading dates he has had some idle time. Occasionally when the type of meter to be tested or its location has required two men, arrangements have been made for a temporary helper. This service began in 1929 by request of the Building Owners Association to have made available for their convenience such an experienced person.

Q. Does the Company, The CEICO Company, do any 1803
other business? A. In 1938 another subsidiary of the Cleveland Electric Illuminating Company was dissolved and its assets, principally real estate parcels, were transferred to The CEICO Company whose charter was amended to permit the purchase, lease and ownership and other functions in connection with real estate. This occurred in connection with a simplification of the corporate structure of the Company by the elimination of this wholly-owned subsidiary, The Power Construction Company, to which I have referred, at which time all of the assets of The Power Construction Com-

pany were transferred to The CEICO Company whose name was then changed from its former name, The CEICO Service Company, to its present name, The CEICO Company.

—943—

Q. What is the nature of the real estate now held by The CEICO Company? A. The real estate held by The CEICO Company comprises 20 parcels, the aggregate book value of which is $36,600. The 20 parcels owned are held either for future expansion of the transmission system of the
1805 Company——

Q. (Interposing) —of the Cleveland Electric Illuminating Company?. A. —of the Cleveland Electric Illuminating Company, or are being held for disposal. Seventeen of these 20 parcels were transferred to The CEICO Company by The Power Construction Company and three have been directly purchased by The CEICO Company to protect Cleveland Electric Illuminating Company easements thereon.

Q. Why was The CEICO Company organized as a separate company? A. In accordance with its long-standing policy of not merchandising appliances or equipment, and of
1806 not doing contracting work in competition with its customers, Cleveland Electric Illuminating Company organized The CEICO Company as a subsidiary at the request of certain of its customers in order that the Company would not appear in this competitive light in its community.

Q. Are the officers of The CEICO Company part of the personnel of the Cleveland Electric Illuminating Company?

—944—

A. They are.

Q. Do they receive any salaries? A. They do not.

Q. I believe you have testified that the Company has but one employee? A. The CEICO Company has one employee.

Q. What are its total assets? A. Its total assets, including the 20 parcels of real estate I have described, aggregate $43,762 as of December 31, 1939.

Q. And its net earnings for the 12 months ended December 31, 1939? A. Its operating revenue herein described as the residue from deducting total expenses from sales, was a deficit of $270. 1808

Q. What were its sales for 1939? A. Sales for 1939 were slightly under $6,000, being $5,998.

(Discussion off the record)

The Examiner: Is this a good point to recess for lunch?

Mr. Hamilton: In view of the fact that the witness has to return to Cleveland, I would like at this time to request an adjournment until Monday morning, at which time Mr. Lindseth will continue, and at which time I expect to complete his direct examination. 1809

Mr. Binford: Mr. Examiner, I have no objection to the witness' being excused until Monday morning if his business in Cleveland requires his presence there, but it seems to me that to recess the hearing until

that time is unnecessary as counsel has surely known beforehand of this situation and should be able to go on with some other witness' testimony for the rest of the week.

1810

Colloquy

The Examiner: Well, have you a witness available, Mr. Hamilton?

Mr. Hamilton: As I have already indicated to counsel for the Commission in an off-the-record discussion, we have no witness available at this time and I would prefer to resume with Mr. Lindseth on Monday morning.

Mr. Binford: I still think that the situation might have been forseen, Mr. Examiner. The mere failure

1811

of counsel to have a witness present, although physically I guess it must result in a recess of the hearing, is no proper excuse for it.

Mr. Hamilton: I would like to state for the record that it should be well understood by this time that the production of these witnesses is really not a simple task. I mean by that, that these men are important and significant in the operations of their own companies and that we can't simply at our own whim or request, insist or demand that they appear on a minute's notice.

1812

Mr. Binford: The process of subpoena is open to Respondents as well as to the Commission.

The Examiner: I think that all things considered we should let Mr. Lindseth off until Monday morning, but I understand you have some corrections to offer to the transcript and we will come back at two o'clock for that purpose. We now stand recessed until two o'clock.

(Recessed at 12:40 o'clock)

AFTERNOON SESSION

(The hearing was resumed at 2 o'clock p. m.)

The Examiner: The hearing will be resumed.

I would like to ask you gentlemen if you have agreed on any method by which the corrections which you want to make in the transcript can be effectuated?

Mr. Binford: I think we have.

Mr. Hamilton: We have. The corrections will be 1814
reduced to writing and a memorandum of the corrections furnished to the stenographer for incorporation into the transcript proper.

The Examiner: Very well. When you have written up these corrections, the reporter will incorporate them in the record.

Turning to another matter, I think this is a good time for me to pass on the question whether the Commission in the documentary evidence which it introduced at the opening session of this hearing vouched 1815
for the accuracy of the documents introduced.

Mr. Hamilton: Mr. Examiner, may I interrupt for just a moment?

The Examiner: Yes.

Mr. Hamilton: Counsel for the Commission has submitted what is in effect a reply brief to our brief. I wonder if we are to be given an opportunity to file our own brief on the question?

1816 *Colloquy*

The Examiner: Yes, you may do that, but in view of the disposition I have in the matter, maybe you would not care to do so. I will make known my ideas about the matter.

At the time the evidence was offered, the observation was made by counsel for the Commission that the Commission could not vouch for the accuracy of the particular individual statements made therein. After a good deal of argument pro and con, I admitted the
1817 documentary evidence in evidence with the right in the respondent at some later date to object to its admissibility on the ground of relevancy and materiality.

At the time, I thought the question of whether the Commission vouched for these documents was pretty much in issue, but on the present state of the record it seems that it is purely an academic question, and for the present I think I should overrule that objection and if at some later date in the hearing some move is made by Commission's counsel to question any of the data in these documents, you might
1818 renew your objection.

That will be my disposition of the matter for the present. I will hold these briefs, and if it becomes a real question in the case later on, I will then dispose of it.

Mr. Hamilton: May I also state, Mr. Examiner, that while copies of the Commission's brief were undoubtedly served in due course last week, they actually were not received by us until this week, and there-

fore our opportunity to review that brief has been very limited at this time, and with your permission we would like to reserve the right to file a reply brief, and if after full consideration a reply brief seems necessary.

The Examiner: You may do that.

Now, if there is nothing else to present, in view of my having excused Mr. Lindseth until Monday morning and no other witness being available, this matter is continued until 10 o'clock a. m. of Monday, August 12. 1820

(Whereupon, at 2:20 o'clock p. m. a recess was taken until Monday, August 12, 1940 at 10 o'clock a. m.)

1822

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

1823

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1102-A,
Securities and Exchange Commission Building,
Monday, August 12, 1940,
Washington, D. C.

1824

Met, pursuant to recess, at 10 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

(As heretofore noted.)

1825

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon ELMER L. LINDSETH resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Lindseth, does the Cleveland Electric Illuminating Company conduct a steam business in addition to its electric 1826
utility business? A. Yes, it does.

Q. And can you give us approximately for 1939 the relation of gross revenue from steam as compared with gross revenue from electric service? A. In 1939 the gross revenue received from steam sold was about $1,350,000.

This is slightly less than 5 per cent. of the aggregate gross revenue received by the Company from both the electric and the steam business. The number of customers served is about 600.

Q. These are steam customers? A. Steam customers.

Q. Is the steam business necessary to the conduct of the 1827
electric business? A. Yes, it is. In the generation of electric energy in the district in which the Company serves coal is

the economically available fuel to be burned under boilers from which the steam may be used either for heating or for the generation of electricity or both. In the event that steam is not available to consumers in downtown Cleveland for heating the economics of the situation suggests that there be explored the possibilities of generating the electric needs for the building as well as the generation of the steam needs.

1828

This is a calculation requiring some considerable skill and experience and not infrequently consumers making such off-hand calculations will be too optimistic about the attractiveness of the free power available from making their own steam and electric energy.

When steam is required and not able to be purchased there is necessary for the service of the building the installation of a boiler plant, coal bunkers and stacks. There is necessary to be employed the help required for the attend-

1829

ance of the boilers, the maintenance thereon, and often the incremental cost of adding an electric generator with whatever attendance is computed, plus the maintenance thereon, is too inadequately considered by the customer.

Clear thinking is required. The Company, however, by virtue of furnishing both steam and electricity to these consumers, has been able to demonstrate in virtually every case the economy of purchasing both the steam and the electricity from the Company.

The number of establishments in the area served with steam and electricity which generate their own electricity or

1830

a part thereof, is only four, and of these four which generate all or part of their needs only one generates all its needs and this is the Federal Reserve Bank in downtown Cleveland where particular rules requiring complete independence of supply of service made it necessary to generate the power requirements within the building.

Of the three other establishments which generate part of their electric needs one has need for processed steam but buys the electricity in the summertime and at night. Two others

buy electricity in the summertime and generate their own in the winter.

Based on the experience of the Company it may then be said that the operation of the steam utility is invaluable to the electric utility in enabling the electric utility to sell its electric energy to all of its prospective customers or virtually all of its prospective customers. Definite losses in economy of the electric system would result were the steam utility not a part of its operations.

Q. How long have you been in the steam business? A. 1832
Since 1906.

Q. Are all your steam customers also electric customers? A. Yes, they are.

Q. I believe you have testified that through promotional programs and through the natural growth of the business the

presence of isolated generating plants has been eliminated during the course of years in large measure.

Q. That has been true, has it, both as to plants which have produced electricity and as to plants which have produced steam for consumption of the owner on its premises? 1833
A. Yes, that, too, is true. For example, in the area in which the Company supplies steam for heating there are about 17 buildings which operate their own heating plants. Only six of these are of a size greater than two million cubic feet of building volume and all of such buildings buy their total electric requirements.

Three of these buildings have use for large quantities of processed steam, that is steam for use other than heating purposes, in some cases at a pressure higher than is able to be purchased from the Company requiring the need of

1834 *Elmer L. Lindseth—By Respondents—Direct*

a boiler plants to furnish the processed steam from which the steam required for the heating is an incremental product.

Q. Has the elimination of isolated steam heating plants been beneficial to the community? A. Yes. Three principal benefits accrue to the community from elimination of numerous isolated steam heating plants.

For example, the coal economically available to the Cleveland market is generally considered to be a low grade fuel, certainly that fuel which is economically able to be utilized
1835 in an industrial type of heating plant. Atmospheric pollution in a large industrial community is a serious problem.

—954—

The presence of the 600 or almost 600 heating plants which are the alternative to the Company supplying heat and steam for sale to its present 600 customers, would create a very serious atmospheric pollution problem in downtown Cleveland, in the area served by the Company's steam heat plants.

The discharge from these numerous small plants which would be inherently of low efficiency and inherently of such design and restrictions as to not provide for modern dust
1836 and smoke eliminating apparatus, the pollution resulting from these plants would be substantial. The alternative, namely the burning of the required fuel in the plants of the Company, in large boilers efficiently operated and designed for the elimination of smoke and dust, results in a vastly improved atmospheric condition.

Secondly, Cleveland, in common with other large cities, is faced with a problem of substantial traffic congestion. The elimination of the trucks required for the delivery of fuel, the removal of ashes and other incidental operations to a

large number of isolated heating plants is a substantial benefit to the community.

Third, the reduction in the fire hazard resulting from the elimination of a large number of boiler plants in cramped quarters, in basements and sub-basements of buildings, with stacks going through those buildings, is a real and tangible benefit.

—954-A—

Q. Will you describe further the service area in Cleveland served by steam? A. Referring again to Exhibit 21, 1838
the area served by the Company's steam heating division is a compact downtown area of about 9/10 of a square mile. The portion of the map shown as the center of Cleveland and suburbs in which are located the general office building of the Company indicated as point PS, the Canal Road plant indicated by the symbol CN, the Bolivar Road sub-station indicated as BV, the Dodge sub-station indicated as DG, these are in the area served by steam heating.

The scale of this map is about one-third of an inch per mile so that the area served by the Company's steam heating facilities may be considered an area about one-third of 1839
an inch square, circumscribing the four points which I have mentioned. This is downtown Cleveland. It is exclusively a business district and there are but a few streets in the eastern portion of the district in which service is not available. With the few exceptions which I have previously described all buildings in the area buy steam from the Company.

There is one further qualification. Certain of these small electric utilities which are developments of real estate companies such as the Bradley Light, Heat and Power Company,

1840 *Elmer L. Lindseth—By Respondents—Direct*

serving a number of electric customers largely in its own buildings, does serve its own steam customers in similar fashion.

Q. What are the points at which steam is manufactured

—955—

for sale? A. The Company has two steam plants, one indicated on the map as Canal Road plant with the symbol CN, and a second at the opposite end of the system, the northern portion of it, the East 20th Street plant.

1841 Q. How large an investment is represented by this plant? A. The two generating plants of themselves aggregate a little less than $4,000,060, $3,700,000.

Q. Do you know the number of men employed in these generating plants? A. The number is about 120 during the heating season, and during the summer when the heating load is necessarily low the number is about 110.

Q. Isn't your Canal Road plant also used for generation of direct current? A. Yes, it is. The Canal Road plant was the first main generating plant built by the Company and it was from the Canal Road plant that the first steam dis-
1842 tribution lines were constructed. This plant has now been substantially reduced in its electric generating capacity and no longer has the prominence that it had a number of years ago, but as a part of the generation of steam there is associated the generation of electric energy, the steam first going through the electric generator, thence being exhausted to the steam heating system for distribution to consumers.

—956—

Q. So that this plant began as an electric generating plant and was developed as a steam heating plant as well. A. Yes, in 1906 the Company built the first steam heating

line from the Canal Road plant delivering live steam to a neighboring building. During this period the demands on the plant for electric power were very substantial, in fact so substantial that there was virtually no expansion in the steam heating business at all.

By 1910 the Canal Road plant had reached its ultimate capacity of electric generating equipment and shortly after the Lake Shore plant was built. The construction of the Lake Shore plant relieved the Canal Road plant of a substantial amount of electrical load, releasing thereby steam 1844
capacity which could be utilized for steam heating business and from that time on the steam heating business grew very rapidly, taking its output from the Canal Road plant.

Q. What is the steam send-out from Canal Road? A. The aggregate send-out last year from both the East 20th Street and the Canal Road plants was 2,570,000,000 pounds of steam. I don't believe I have a breakdown of this as between the two plants.

Q. Isn't it true that in the economical distribution of steam for either purpose, heating or other purpose, that the distribution can only be for a short distance from the steam 1845
generating plant proper? A. Yes, that is true from two

points of view. One is the economics of the situation which requires that fixed charges be kept to a reasonable minimum, thereby precluding long distance transmission and distribution, and secondly is the loss angle, since steam being transmitted long distances loses substantial amounts of heat energy through radiation outward from the conduits and tunnels.

1846 *Elmer L. Lindseth—By Respondents—Direct*

Compact high load density areas are virtually the only areas which lend themselves on any large scale to central heating and distribution of steam from central plants.

The steam distribution system of the Company is in part one of high pressure distribution and in part one of low pressure distribution. From the Canal Road plant steam is served to certain portions of the system at high pressure, about 150 pounds per square inch.

The steam so sent out of the plant is used in a number
1847 of buildings in the so-called Terminal area, including the Federal Post Office, one hotel, a department store, a number of office buildings, and a railroad terminal. The group uses about 22 per cent. of the entire steam output from the steam heating department. The rest of the area is served at low pressure and the send-out from the Canal Road plant is from 8 to 18 pounds per square inch.

The output from the East 20th Street plant is at somewhat a variable pressure but generally speaking it is high pressure steam in the range from 130 to about 150 pounds

—958—

1848 per square inch.

Q. You spoke of the second steam generating plant at East 20th Street. Will you describe that plant? A. This plant was built in 1924 when the steam requirements on the Canal Road plant had risen to such a value as to require additional plant capacity. The plant was put into operation in 1925 and is located about three-quarters of a mile east of the center of the city at the extreme northeast portion of the steam heating distribution system, and is built exclusively as a steam heating plant.

The plant comprises six boilers and generates steam at about 175 pounds pressure. Of these six boilers four have

1849

a capacity of about 130,000 pounds per hour and two have a capacity of about 150,000 pounds of steam per hour. The plant is pulverized coal fired.

Q. Is the plant located by symbol on Exhibit No. 21? A. It is not. This map shows the electric facilities and does not include the second of those plants at East 20th Street. It would be located immediately above the point indicated DG near the shore of Lake Erie.

Q. Is the present steam heating system adequate for the demands placed upon it? A. Yes, it is. The steam heating 1850
load has not grown at a rate at all comparable with the electric load.

For example, the peak load required to be carried in 1939 was 1,045,000 pounds per hour. This was experienced

during the winter of '38 and '39. The peak load in 1940 to date, that is during the winter of '39 and '40, was 1,155,000 pounds of steam per hour on January 19, at an outside temperature of minus 11 degrees Fahrenheit.

The corresponding peak in 1934 was almost identical with the 1940 peak, namely 1,156,000 pounds of steam per 1851
hour. These peaks have been exceeded only in 1936 when the peak was about one per cent. greater, being 1,168,000 pounds of steam per hour. The peak load forecast for 1941 is 1,200,000 pounds of steam per hour.

The capacity of the system or the steam load able to be carried with normal spare allowance for loss of equipment, is 1,320,000 pounds per hour, or a value 10 per cent. in excess of the expected 1941 peak. This capacity is made up of 790,000 pounds per hour capacity from the East 20th Street plant, and 675,000 pounds per hour capacity of the

Canal Road plant, the aggregate of which is corrected by an amount of 145,000 pounds per hour for the loss of the largest boiler on the system at time of peak.

Q. How is steam distributed from Canal Road and East 20th Street? A. The steam heating distribution system comprises a grid or net work of underground lines traversing virtually all of the main and side streets in the areas served. This grid system at any point may be fed from both directions thereby enabling service connections, for example, to
1853 be made to the distribution system without inconvenience to more customers than those immediately adjacent to the point on which work is required.

—960—

The grid system is equipped with a very large number of steam isolating or distribution valves so that by proper operation of these valves individual areas may be isolated for maintenance, repair or construction without the requirement that a substantial number of customers be affected thereby.

Two standards of construction are in use, one the so-called low pressure section where designed pressures are 30
1854 pounds per square inch, and a second section in which design pressures are 250 pounds—design standards are 250 pounds.

Q. Does the demand of the customer determine the pressure which he takes, whether high pressure or low pressure? A. No, that is not the controlling factor. The controlling factors are geographical rather than character or type of load and in the areas served by the low pressure portion of the system, high pressure steam is not available for distribution or purchase. The high pressure area for service, at least so far as controls the purchase and sale of the steam

 1855

at high pressure, is adjacent to the Canal Road plant. That is limited high pressure area.

Q. How many feeders are there running from each of the two generating plants? A. From East 20th Street there

—961—

are two main lines, the feeding and distribution grid, and from Canal Road plant four such lines, one normally operated high pressure and three normally operated low pressure although one of the latter group may be operated high pressure. 1856

Q. Functionally how is the steam heating business conducted as far as personnel of the Company is concerned? A. In general the supervisory personnel of the steam heating department is the personnel which gives a major portion of its time to the electric business. For example, the superintendent of power of the Company who is in charge of the operation of the Company's electrical generating plants, is similarly in charge of the steam heating plants.

The production department which is responsible for the efficiency of operation, economy calculations, studies of allocation of load, forecasting of loads and the like—this de- 1857
partment, too, is a department of the power division of the Company but extends its facilities to the steam heating department as well.

The underground division which constructs and maintains the underground facilities of the steam heating business, likewise is charged with the responsibility for construction and operation of the underground electric lines of the Company.

There is, however, an exclusively steam heating department consisting of a superintendent and a few men, less

than a dozen, which department does contact the steam heating consumers, handles the problem of operation, meter

—962—

reading and similar problems with the steam heating consumers. This department, however, is a division of the Company's service department under the assistant general manager in charge of that department, the major functions of which are electric.

Q. And that small group of men of which you have spoken
1859 is the only collection of personnel, or are the only individuals whose work is exclusively that of devoting themselves to the steam business, is that right? A. Well, I would like to add one qualification to that, namely that in the East 20th Street heating plant all of the employees, although they are subordinate to the superintendent of power who is charged with the responsibility of the electric generation for the system, are wholly engaged in making steam for distribution from the steam heating system, so that there are in the two steam heating plants more than 100 employees who devote substantially all of their efforts to making steam
1860 for the steam heating division, although the superintendent of power is in charge of both such plants.

Q. The superintendent of power being an electrical employee? A. Yes.

Q. Now, how do you forecast steam load or scheduled steam load? A. The anticipation of what the steam requirements will be one day or a week or a month in the future is a problem that has a vital bearing on the economy with

—963—

which the system operates. Likewise it has a substantial bearing on the adequacy of service which will be rendered

by the Company because if the demands for steam are in excess of the capacity provided there will be less than enough steam to go around and general dissatisfaction would result.

On the other hand, if the demands for steam are substantially less than the amount of capacity provided this excess capacity results in loss of economy. Therefore, the forecasting and the accurate forecasting of expected steam loads is vital to the economical operation of the system. This forecasting is done a year in advance of the actual load being experienced. For example, during this month there is 1862
prepared a forecast curve of the load which will be experienced next winter on the steam heating system for all temperatures experienced.

Based on this curve the operating engineer in charge of the steam heating distribution system at the Canal Road plant, makes short range forecasts of the expected temperature and other weather conditions affecting load, principally wind. Each night his engineer, through the United States Weather Bureau reports and radio reports received from the airport weather stations, forecasts the expected temperature for the following morning. 1863

Based on this forecast of temperature the number of boilers to be put on the line is then determined, the number for each of the plants is established and this is the capacity

—964—

for the day's load. Because of the substantial amount of experience that these people have now had in forecasting load and the experience which the engineers have obtained in providing these curves of expected load, it is very unusual for the steam load to deviate from the capacity provided for

1864 by much more than a few per cent. The number of days when the temperature is actually more than two degrees different from the forecast temperature is very small. The accuracy of this forecasting has been developed to a high order.

Q. And whose is the function of making these forecasts? A. The short range forecast, temperature expected the following day, is the duty of the engineer in charge of the Canal Road plant who acts as the load dispatcher for the
1865 steam heating system.

The long range forecasts, namely the load which is expected to be experienced next winter for a given temperature, for example at zero degrees Fahrenheit, that task is the job of the production engineering department to make the long range forecasts.

Q. And is the production engineering department an electrical department? A. Essentially so. It does have in each of the steam heating plants a single man, a member of its department.

Q. And whose is the function of constructing and repair-
1866 ing lines and other steam properties?

The Witness: Will you repeat that question?

—965—

(Pending question read back.)

The Witness: Well, the function of constructing and repairing the lines to the extent that they are the underground distribution lines, that is the duty of the underground department of the Company. Other steam properties, however, such as these steam heating plants, these are built on contract by a construc-

tion firm. Only the distribution and transmission facilities of the Company are built with its own personnel.

Q. The underground department is an electrical department? A. Yes, it is, primarily so.

Q. How are such things as accounting matters and billing for steam service handled? A. The general accounting department of the Company handles the general accounting for the steam heating department as well. The consumers 1868
accounting department of the Company handles the billing for the steam heating department as well. Budgeting, cost control, construction job orders, preparation of income statements and fixed asset accounting for the steam heating division are handled by the Company's general accounting, budgeting and control departments which are in charge of the accounting for the electrical business of the Company as well.

Q. And how about the task of testing equipment, how is that handled? A. The testing of equipment is handled by the Company's production department which is a division of 1869
the power department under the superintendent of power,

—966—

acting through the production engineer.

Q. If your steam business were operated separately would that fact result in increased costs in operation? A. Yes, it very definitely would, because much of the technical and skilled personnel now used by the steam heating department is used but a small fraction of its time in that service. That is, the salaries of the production engineer and the superintendent of power are allocated only in small fraction to

the steam heating division, being primarily required for the electrical division. Laboratory facilities similarly are used only to a very limited extent and are available on an allocated cost basis to the steam heating department.

Q. Does the Company do any business other than its electrical utility business and its steam business? A. No, it does not.

Q. Are its electric business and its steam heating business confined to the territory shown on Respondents' Exhibit No.
1871 21? A. Yes, they are.

Q. Does any distribution or transmission line of the Company cross state lines? A. No, it does not.

Q. Does the Company transmit or distribute electric energy across state lines? A. It does not.

—967—

Q. Does the Company purchase any electric energy which has been generated outside of Ohio? A. Generally speaking, no, but only to the extent that energy might be purchased from a neighboring utility who might indirectly have obtained some such energy from a very obscure and remote
1872 source, would it be possible at all for the Company to ever obtain such energy.

Since the neighboring utility, however, purchases energy from the Company but does not sell, the Company therefore does not buy energy except incidentally as such energy might be reversed in its flow on the lines and it could unwittingly take energy from another utility. The source of such energy from the other utility, since the quantities involved are so small, would have been generated in Ohio.

Q. Do the two subsidiaries of the Company, Power and Light Building Company and the CEICO Company, do any

1873

business other than that to which you previously testified? A. None.

Q. Are the businesses of those two companies, Power and Light Building Company and the CEICO Company, confined exclusively to the territory shown on Exhibit No. 21, Respondents' Exhibit No. 21? A. They are.

Q. None of their business is done outside of the state of Ohio? A. None is.

—968—

1874

Q. Are you familiar with the participation of Cleveland Electric Illuminating Company in various North American System Inter-Company committees? A. Yes, I am.

(Discussion off the record.)

Mr. Hamilton: Will you read the last question and answer?

(The preceding question and answer were read.)

By Mr. Hamilton:

1875

Q. What are those committees? A. The Station Advisory Operating Company, the Inter-Company Electrical Committee, the Accounting Committee, the Purchasing Agents Committee, from time to time a Sales Committee, and numerous less formal contacts.

Q. Does the Cleveland Company receive any benefits from its contacts with these committees? A. Yes, it very definitely does. It receives these benefits from the frank and authoritative interchange of information, including confidential data which would not be revealed elsewhere by the Company.

1876 *Elmer L. Lindseth—By Respondents—Direct*

For example, I was in charge of an inventory and appraisal of the Company's properties in 1939 and 1940 and required certain information from other utilities which I felt would be helpful to me, having to do with certain phases of underground subway data. Because the volume of effort required to furnish the necessary information was substan-

—969—

tial I felt and others in the Company with whom I conferred similarly felt that we were justified in asking only the
1877 member companies of the System represented on the Inter-Company Electrical Committee for this information.

I requested the Company's representative on that committee, the Company's electrical engineer, to obtain these data for me, which he did. The Company obtained such information from no other company, feeling that it could not ask another utility for information of this confidential nature, nor for information requiring such a substantial volume of work for its preparation.

Q. Does the participation of representatives of the Company on these committees contribute to their fund of infor-
1878 mation? Does it have a generally broadening effect on personnel? A. Yes, the Company feels that the benefits derived from its participation in Inter-Company Committee work goes farther than the specific information obtained but goes to the general broadening influence on the particular Company representatives and others in the Company who from time to time attend such meetings.

For example, while never a representative of the Company on the Inter-Company Committees, I have benefitted very materially from the Company's representation on those committees by my having been in attendance at meetings

for the handling of specific problems in which I was concerned in my duties.

—970—

In addition to the special information exchanged and these broadening influences on the personnel, there is a substantial amount of regularly compiled data on operating and design problems which has proved of substantial benefit to the Company.

Such routine data are, for example, circulated in connection with the power generation costs and performance of the 1880
major power plants of the companies represented. Such data as the fuel economy, the B. t. u. per kilowatt hour, are reported routinely each month. Such performance is reported not only on an actual basis which was the experience of the Company, but it is also reported on a standard basis, that is a theoretical basis of efficiency at which the plant should have operated.

The difference between the actual operation and the standard operation is explained in the reports. There are similarly reported such factors involved in power generation as machine-use factor, the distribution of B. t. u. or heat 1881
energy among the various phases of the generation of power, and in addition to these factors there is routinely reported the comparative expense of generation of power segregated as to boiler room operation, boiler room maintenance, boiler room maintenance materials, tools and supplies, similar factors for the turbine room, and numerous other data of value in comparing the excellence of performance of the several plants.

Now, since the guage of thermal performance of a plant is

—971—

in terms of heat units, the source of which is in the fuel, it becomes extremely vital to an accurate comparison of results that the fuel laboratories of the several companies maintain rigorous control of their analytical procedures. In order to achieve this rigorous control each month, in rotative order of the companies, there is sent out representative plant coal samples for analysis by the laboratories of other companies and at periodic intervals for check by the United States Bureau of Mines. The results of these analyses are tabu-
1883 lated in a comparative statement for the Committee and the procedure provides a check not only on the technique of the individual laboratories, but as an indication of the accuracy of the thermal performance reports of the power plants.

In the case of new plant design or construction tentative plans and major decisions are submitted to the Committee for review and discussion, and in the consideration of these matters the combined experience of all companies is contributed.

Simplicity of design, reliability of operation, economy of operation, economy of investment, all these have been
1884 achieved on the Cleveland system in part, at least, because of the exchange of information made available through these committees. The activity goes farther than comparing actual performance and actual design of existing plants.

For example, four or five years ago when there was a very substantial revival of interest in Diesel engines, a consider-

able sales problem appeared from a competitive angle because of lack of adequate information as to the true costs of construction and operation of Diesel engine plants, especially in small sizes for isolated use. As the production engi-

neer for the Company I, personally, made a comprehensive study of Diesel power generation, its initial construction cost and its operating expense, which information was prepared in the form of a report for circulation to the member companies on the committee.

Q. Which committee is this? A. The Station Advisory Operating Committee.

At various times specialists other than the Company's representatives on the Committee attend these meetings for special studies. For example, at a meeting of the committee 1886
held in St. Louis about 1933, a consulting chemist was retained for discussion of a highly technical phase of boiler feed water chemistry and the embrittlement of boilers.

I was at that time in charge of the chemical treatment of boiler feed water and the chemical laboratories for the control of this treatment.

I attended this meeting in St. Louis for consultation with Professor Straub of the University of Illinois who was an outstanding expert in this field.

A third phase of benefits resulting to the Company from participation in activities of this kind is the making avail- 1887
able to all member companies of research and experimental work undertaken or developed at one of the companies. For

example, a comprehensive report on corrosion in the heating system, particularly on consumer's premises, was made available to the Cleveland Company, Cleveland Electric Illuminating Company from the Wisconsin Electric Power Company several years ago, based on which report very substantial improvement in operations was made possible on the Cleveland System.

Frequent inspection trips are made by these committees in the plants of the utilities of the other companies represented on those committees. Corresponding data from the Company's participation in the Inter-Company Electrical Committee covers similar routine and periodic reports on the performance of electrical equipment among the member companies.

For example, there are prepared and circulated at regular intervals growth statistics of use to the companies in forecasting load growth, performance statistics on numerous phases of the Company's apparatus performance such as frequency of circuit trip-outs on transmission and distribution circuits of all voltages, both self-clearing and non-self-clearing, transformer failures, wood pole failures, the frequency with which distribution wires are down, usually expressed as the average number of such cases per year, per 100 miles, cable failures by voltages, and other similar information.

Annual data are likewise circulated on electrical losses on the system, the efficiency of transmission, transformation,

—974—

distribution and conversion. These data are prepared on an annual basis.

In addition to the circulation of data and the discussion phases of these meetings, inspection trips are frequently made to observe new system installations and a number of cooperative investigations or objectives have been studied by either the committee collectively or individuals thereon.

These objectives were assigned to different member companies for study and analysis, and the results made available to the committee representatives. Some of the objective studies which have proved of value to the Cleveland Company have related to the proper voltage to be used for alternating

1891

current distribution, the size of lead to be taken on the system at sub-transmission voltages, the economics of cable salvaging, the economies in repair of distribution transformers, the study of the most economical size and type of D. C. feeder cable for Edison systems, studies of when are automatic alternating current sub-stations justified, and numerous other investigations of a similar character.

In addition to these formal objective studies there is a very substantial amount of interchange of information by correspondence between meetings, which information is usually circulated to all members of the committee, even though in specific response to a request from but one company.

1892

Very substantial benefit has been achieved by frank dis-

—975—

cussion and free interchange of information on potential hazards in generating plants. For example, in 1925 while the Avon plant of the Cleveland Electric Illuminating Company was being constructed a major shut-down of several hours' duration occurred at one of the power plants of the Union Electric Company of Missouri. The Cleveland Company's electrical engineer, as soon as word was received of the failure, was dispatched to the scene of the trouble and it developed that the cause of the shut-down was from a certain characteristic of design which resulted in the failure, not only of a single pole of a circuit breaker element but by passage of the gas and smoke to other parts of the switch house structure. The initial failure was communicated to other equipment and resulted in the failure as well of the disconnect associated with the oil circuit breaker.

1893

Based on the experience revealed in this major case of trouble the design of the Avon power plant was materially

1894

altered to preclude the possibility of similar failure there resulting from the same causes as had prevailed in the St. Louis failure.

In the interchange of pertinent information on advertising and promotional campaigns, data are circulated between the member companies for the use of the Sales and Advertising departments. For example, in the interchange of such information there has been obtained by the Cleveland Company, from others, data of value in its promotional programs

1895

for commercial, for industrial, and for residential sales.

—976—

Transportation is a very important industry as a consumer of electric energy. The Milwaukee Company, because of its close contact with its Traction Company, has been able to furnish to the Cleveland Company information of substantial value on the economics of trolley bus operation, electric street car operation, which has been helpful to the Cleveland Company in selling its electric energy for street railway use.

Similar information has been obtained from the Potomac Electric Power Company in the financing of electrical appli-

1896

ances, the details of range promotion. The Company has obtained from Union Electric Company of Missouri assistance to our sales engineers in the promotion of air conditioning; for example, since air conditioning in St. Louis was developed at a substantially earlier date than in Cleveland.

There is likewise an exchange or circulation of advance proofs or copies of much of the advertising and sales promotion material and the Cleveland Company scans such material for ideas and ideas applicable to the Cleveland market have been adapted to Cleveland's needs. The material originating in Cleveland has likewise been sent to other com-

panies. This material comprises plan books, direct mail booklets, folders, outdoor display copy, store and window displays, radio programs, newspaper campaigns and similar information.

Q. You have spoken of the interchange of data and reports between companies' members of these committees; is that interchange of benefit to the Cleveland Electrical Illuminating Company? A. It very definitely is.

—977—

Q. It gives you a comparative idea of performance rec- 1898
ords of other large utilities, is that right? A. In a manner which would not be available except through committee representation of this character, because the volume of such information required is substantial, much of it is confidential, and we would not, as a company, feel free to submit such information on such basis, were it not through the committee on which we are represented.

Mr. Hamilton: Off the record?

The Examiner: Yes.

(Discussion off the record.) 1899

Mr. Hamilton: Mr. Examiner.

The Examiner: Do you want this on the record?

Mr. Hamilton: Yes, if I may.

The Examiner: All right.

Mr. Hamilton: This concludes my direct examination at this time, of Mr. Lindseth.

Mr. Browning—my senior in this proceedings—has been laid up with an attack of influenza, and has been in bed for the past few days.

The Examiner: I am sorry to hear that.

1900

Colloquy

Mr. Hamilton: I anticipate that he will be available down here tomorrow evening; subject to acquiescence from the counsel for the Commission, I would like to suggest that the next step in the proceedings be the cross examination of Mr. Lindseth, at the coun-

—978—

sel's convenience.

As soon as Mr. Browning is physically able to go on, he expects to take up the direct examination of the

1901

next witness and, as I say, I anticipate he would be available tomorrow evening or Wednesday morning.

In any case, he will be ready to start on Wednesday morning, with direct examination. Therefore, the cross examination could fit in at any time, at Mr. Binford's convenience, between now and then.

Mr. Binford: Under those circumstances, Mr. Examiner, I would suggest, if it is agreeable to the Examiner, and to counsel, that, unless it is unduly inconveniencing the witness to stay over, that the cross examination of Mr. Lindseth be set for tomorrow

1902

morning at ten o'clock.

Mr. Hamilton: I am sure that is convenient for Mr. Lindseth.

The Examiner: Very well. In view of that situation, we will recess this matter until ten o'clock tomorrow morning, for cross-examination of Mr. Lindseth.

(Whereupon, at 11:20 a. m., August 12, 1940, the hearing was recessed until 10:00 a. m. the following day.)

—979—

1903

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

1904

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1102-A,
Securities and Exchange Commission Building,
Tuesday, August 13, 1940,
Washington, D. C.

1905

Met, pursuant to recess, at 10 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

(As heretofore noted.)

1906

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon ELMER L. LINDSETH resumed the stand and testified further as follows:

Cross Examination by Mr. Binford:

1907

Q. You have been with the Cleveland Electric Illuminating Company since 1926, did you testify? A. That is right.

The Examiner: This is the start of cross-examination, Mr. Reporter.

By Mr. Binford:

Q. For how long have you been technical assistant to the president of that corporation? A. Well, the precise date of appointment is, I think, not an established date, for the reason that I had been performing the duties for a substantial time, which I am now performing, and no one prior

1908

to me had ever been technical assistant to the president.

At a time when we were revising the organization diagram of the Company, in the early part of 1940, we were faced with the problem of defining my duties for the diagram, and I was assigned the title of technical assistant to the president. The office that I occupied at that time I had been occupying since January of 1938, and the character of the

duties I had been performing at that time I had been performing since about January, 1938.

The date, I think, when I said for the record that I took the title of technical assistant to the president, was early in 1940.

Q. What was your official title prior to your assumption of your present title? A. I was assistant to the executive engineer of the Company, who was in charge of all phases of engineering—electrical engineering, mechanical engineering, civil engineering, rates, rate research, statistical work, wire relations with other utilities—I was an assistant to him, one of three such.

Q. Just what was the scope of your activities, in respect to relations with other utilities which you just mentioned? A. The executive engineer it was who was in charge of the wire relations with other utilities. For example, the Cleveland Electric Illuminating Company owns, jointly with the Ohio Bell Telephone Company, the American Telephone and Telegraph Company, the Postal Telegraph Company, the Western Union Telegraph Company, a large number of poles. The joint wire relations department, so called, supervises the ownership and agreements, as between the Cleveland Electric Illuminating Company and other utilities.

This division reports to the executive engineer, an assistant to whom I was.

Q. Those relationships involved allocation of costs among the respective companies served by equipment jointly owned, do they not? A. Those relations involved the buying and selling of interests in such poles.

For example, if the Cleveland Electric Illuminating Company owns the pole on which the Ohio Bell Telephone Com-

pany would like to make an attachment, the Ohio Bell Telephone Company may buy an interest in the pole.

It would then be a jointly owned pole, under a 60-40 relationship percentagewise, or some other relationship.

Similarly, if the Ohio Bell Telephone Company owns the pole on which the Cleveland Electric Illuminating Company would desire to make an attachment, the Cleveland Electric Illuminating Company may buy an interest from the Telephone Company.

1913 The initial title very often is determined by the person who first finds it necessary to erect a pole at the point.

Q. Then maintenance is apportioned in accordance with ownership—that is to say, Maintenance cost—or would that be within the scope of your present or former activities?

The Witness: Off the record.

(Discussion off the record.)

—983—

A. Maintenance of any items of property used for the Cleveland Electric Illuminating Company, for example a head
1914 guy to guy the pole at the top at the point at which the Cleveland Electric Illuminating Company's wires attach, that maintenance is a responsibility of the company owning the guy, which is the Cleveland Electric Illuminating Company.

In the event that the Telephone Company had put some wires or a cable lower down on the pole, as their property, for which they erect a guy to brace the pole at their point of contact, the responsibility for the maintenance of that guy is solely theirs.

The replacement of the pole, which is the usual item of maintenance on a pole, since the ultimate failure is due

1915

usually to either inherent decay or accidental damage breaking the pole off, that repair is usually only possibly through complete replacement, when a new agreement is again entered into for a joint ownership of the succeeding pole.

Maintenance of attachments is by the party owning the attachments.

Q. There is no treatment of the pole, such as by creosote or any other matter, to preserve its life, is there? A. The pole is initially creosoted, as a protection against decay and attack. That is, the cost thereof is a part of the original setting of the pole.

1916

Q. But there is no succeeding treatment of the pole as

such prior to its retirement and replacement? A. In the case of the Cleveland Electric Illuminating Company such treatment is only in the experimental stages, where creosoting subsequent to installation is being experimented with, for the arresting of attack by termites or decay.

Q. So that no problem of fractional allocation of costs, other than the cost of the pole itself, is involved in that joint use? A. Well, I wouldn't want to categorically say that they never occur.

1917

The painting of a pole, for example, at a time subsequent to its initial setting might be such a case.

The precise handling of that I am not at the moment familiar with, but conceivably there would be elements of the character you speak of, that might require the allocation of charges by this joint wire relations division.

Q. Yesterday morning, I believe, you testified that there was but one interconnection of your system—that is to say,

the Cleveland Electric Illuminating Company system—with any other system, is that correct? A. That is correct.

Q. What was the name of the company with which there is such a connection? A. The Ohio Edison Company. At an earlier point in my testimony, I refer to facilities heretofore used, now unused, for interconnection with the Ohio

—985—

Public Service Company, the restoration of which to service would require twenty minutes of work on the part of the
1919 Cleveland Electric Illuminating Company to make the necessary cross connection.

Q. How long has that connection been out of use? A. About five years.

Q. And it has been in use at no time during the past five years, even for temporary intervals? A. None to my knowledge.

The Examiner: Excuse me. I believe that point is to the left of Station LR, is it not?

The Witness: Yes, that is the line——

1920 The Examiner: (Interposing) Exhibit 21.

The Witness: That is the line to which I refer.

By Mr. Binford:

Q. Are you familiar with the territory served by Ohio Edison Company? A. No, I am not.

Q. Do you know roughly what territory it serves? A. Well, within the definition of "roughly", yes, I do.

Q. You know it operates in Ohio, don't you? A. Yes, I know that.

1921

Q. And at what point would you say the interconnection of the Cleveland Electric Illuminating Company system with the Ohio Edison Company system is located, with reference to Exhibit 21? A. At the point vertically below switching

—986—

station bearing the symbol PV, and known as Pleasant Valley, at the Cuyahoga-Summit county lines.

Q. Do you have any knowledge as to the usual balance—favorable or unfavorable—of the interchange of current at the point of this connection? That is to say, is more current 1922 sold by Cleveland Electric Illuminating Company to Ohio Edison Company than is received back? A. Very definitely so. The Ohio Edison Company is a customer of the Cleveland Electric Illuminating Company and takes a firm power commitment throughout the day. Any reversal of flow would be incidental and momentary, due to disruption of the normal flow of current.

Q. Are you prepared to state approximately how much electric energy is sold to Ohio Edison Company by Cleveland Electric Illuminating Company at any particular recent period or within any particular recent period? A. Well, the 1923 flow is normally four thousand kilowatts to the Ohio Edison Company.

Q. During what period? A. The interconnection is throughout 24 hours of the day—normally throughout 24 hours of the day.

Q. You know, do you not, that the Ohio Edison Company is part of the so-called holding company system of American Gas and Electric Company? A. No, I do not know that.

—987—

1924

Q. Do you know anything about the interconnections of the Ohio Edison Company with other companies, of your own general knowledge? A. Only from what I had seen from maps of the interconnected system and from discussion with other engineers of such interconnection.

Q. Isn't it a matter of common report and common understanding that the Ohio Edison Company is a part of the American Gas and Electric Company system? A. No, that is not a matter of common knowledge in Cleveland or in

1925

Ohio.

Q. Not in the engineering fraternity? A. No. That is not known to any engineer that I am acquainted with.

Q. And you don't know that to be true? A. I know that that is not true.

Q. You know that it is not true? A. Yes.

Mr. Binford: Mr. Examiner.

The Examiner: This is off the record?

Mr. Binford: Off the record.

(Discussion off the record.)

1926

The Examiner: We will take a 15-minute recess.

—988—

(Whereupon a short recess was taken.)

The Examiner: You may proceed.

By Mr. Binford:

Q. I think I have been under a misapprehension, myself, in my questions in regard to the Ohio Edison Company

Do you know whether or not the Ohio Edison Company is a member of any group of companies, known as a holding company system? A. Yes.

1927

Q. Do you know what that system is known as? A. Commonwealth and Southern.

Q. Commonwealth and Southern? A. Yes.

Q. Do you know whether or not the Ohio Edison Company has physical interconnections, by which an interchange of electric current and power takes place between the system of that company and the systems of other companies? A. I do not know whether interchange of power actually does take place, but I do know of the presence of interconnections over which the flow of power might take place.

1928

Q. Don't you know, as a matter of fact, that there are interconnections, or successive interconnections, by which that company's system—that is to say, the Ohio Edison Company's system—is directly or indirectly connected with lines serving territory as far apart as Northern Indiana and

North Carolina?

Mr. Hamilton: Mr. Examiner, if I may interpose, this witness is not an employee of the Ohio Edison Company, and it seems to me that this is going a little far afield. I don't want to object to it if the scope of the questioning is somewhat limited, but I do feel that, if we are going to conduct an investigation into the affairs of the Ohio Edison Company, we really need another witness.

1929

Mr. Binford: Mr. Examiner, I am going to ask an expert opinion.

The Examiner: The question was if he knew that. If he knows it, I think the question is proper. I will overrule the objection.

1930

The Witness: Will you read back the question?

(Whereupon the pending question was read by the Reporter.)

The Witness: Well, my answer again is I do not know whether Ohio Edison is directly or indirectly so connected, but I know of the presence of facilities through which it might be so connected.

I am, obviously, not familiar with details of operation, but the presence of physical property can not change so quickly as can the operation thereof.

1931

By Mr. Binford:

Q. You know the physical properties adapted for the transmission of electric current exist, with relation to this

—990—

company and companies over areas in various states, do you not? A. Yes, I know that.

Q. Crossing state lines? A. Yes.

Q. And you sell current to the Ohio Edison Company?

1932 A. Yes.

Q. So that the current produced by your system, in part, goes into transmission lines which are part of physically connected transmission lines crossing state lines, is that true?

The Witness: Will you read back that question?

(Whereupon the pending question was read back by the Reporter.)

The Witness: Well, again I must answer that I, of my knowledge, know nothing of the actual state

of those connections, being an operating problem, but the possibility of such connections I do know of.

Q. In other words, you have never seen any meters or looked upon any other instruments which show the current of those connections? A. My position is only this, that the presence of a physical facility for the interchange of power is no evidence of the flow of such energy.

I know of the presence of such physical equipment, but I

—991— 1934

can not testify as to the direction of flow or the fact of flow.

Q. On the other hand, would you be able to state under oath that none of the energy generated in your system goes into interstate flow of electric energy? A. You want this under oath?

Q. Yes.

The Witness: Will you read back that question?

(Whereupon the pending question was read by the Reporter.)

1935

The Witness: This question presupposes an ability to identify a unit of energy transmitted by us to a neighboring utility.

Mr. Binford: I don't necessarily adopt your interpretation of the question.

The Witness: Will you repeat that? Will you read that back?

(Whereupon the last statement of Mr. Binford was read by the Reporter.)

1936

The Witness: But I have no way of answering it except in accordance with my interpretation, unless you want to interpret it for me. Will you interpret what you mean by a flow of energy?

By Mr. Binford:

Q. Can you state definitely at this time that none of the energy generated in the Cleveland Electric Illuminating Company's system flows into the channels of interstate

1937

—992—

transmission?

If you can't definitely state that to be a fact, all I want you to do is say so. A. The amount of energy supplied by the Cleveland Electric Illuminating Company to Ohio Edison Company, under normal conditions is but a small fraction of the requirements of the City of Akron. The point of delivery is at South Akron.

The amount of such energy is but a very small fraction of the total requirements of the Ohio Edison Company in the

1938

State of Ohio.

Since this point of supply from the Cleveland Electric Illuminating Company to the Ohio Edison Company is at the northwestern terminus or substantially that, of the Ohio Edison System, I believe I can say that no energy supplied by the Cleveland Electric Illuminating Company, under normal circumstances, flows in interstate commerce, but is consumed in the State of Ohio.

Q. On the same theory, I suppose you would say that, if a spring supplies water to a reservoir in the north end of a large reservoir, and a village is supplied from that reser-

voir at the same point, consuming a larger amount of water than the water supplied by the spring, that you would feel safe in saying that none of the water supplied by the spring would be found in the south end of the reservoir—is that the same type of reasoning? A. No. That is a fallacy of bad

—993—

analogy, for the reason that a spring, feeding a reservoir, might be discharged into the opposite end of that reservoir by an infinite number of routes.

For example, it may go along the north border and down 1940
the south, or it may go along the west border and—excuse me. Way back there, it is the "north border and the east" and then later on "the west border and the south"—but in the transmission of electrical energy, we are talking about a clearly defined path without alternative.

The analogy might be better from the spring to the village, were there a pipe of finite capacity, and the spring discharging into the pipe a small amount of water—say one gallon per minute—but that intermediate between the spring and the village there were a take-off line removing five gallons per minute from the pipe, the analogy would then be 1941
that all of the one gallon were taken off at the five gallon take-off point.

Q. There is more or less of an ebb and flow, or reversal of current occasionally in transmission lines, however, isn't there? A. In our system, only under abnormal conditions. The Ohio Edison Company is a customer and we strive, with rather precise equipment and high speed control, to insure the continuity of that supply to them at a uniform value.

—994—

It is an abnormality that results in a reversal of flow.

1942 The Examiner: Yesterday counsel for Respondent asked you if energy which your company distributed—any of it—came from outside areas, across state lines, and, as I recall your testimony, you said that, in sending out energy to your interconnection on the south, there was some possibility of return current seeping into the Cleveland Electric Illuminating Company. Is that right?

1943 A. That is right. That is this abnormality to which I now refer.

The Examiner: Now, isn't the question which Mr. Binford propounded to you a similar question, only it is approached from a different angle?

The Witness: No. I think, rather, Mr. Binford is asking about the disposition of the energy.

The Examiner: Yes.

The Witness: Rather than the source of the energy that we buy.

1944 The Examiner: Well, do you differentiate between the two questions that were asked you, one by Respondent's counsel and one by Commission's counsel? They seem to me to be of similar import.

The Witness: (Handing a document to the Examiner and indicating.)

—995—

The Examiner: Well, is there any difference in the two questions propounded to you by the two lawyers?

The Witness: Off the record a minute.

(Discussion off the record.)

The Examiner: I might ask this witness, will he explain the difference in the two questions and his answers to those questions.

The Witness: The question which I answered yesterday, in direct testimony, was this:

"Does the Company purchase any electric energy which has been generated outside of Ohio?" 1946

The answer to that question was this:

"Generally speaking, no, but only to the extent that energy might be purchased from a neighboring utility, who might indirectly have obtained some such energy from a very obscure and remote source would it be possible at all for the Company to ever obtain such energy.

"Since this neighboring utility, however, purchases energy from the Company but does not sell, the Company therefore does not buy energy, except 1947 incidentally as such energy might be reversed in its flow on the lines, and the Company unwittingly take energy from another utility.

"The source of such energy from the other utility, since the quantities involved are so small, would have been generated in Ohio."

—996—

Today's question related to the disposition of energy sold by the Cleveland Electric Illuminating Company to the Ohio Edison Company——

Will you read that question again?

(Whereupon the pending question was read back by the Reporter.)

The Witness: (Continuing) —and asked whether I could state that none of the energy generated in the Cleveland Electric Illuminating Company's system goes into interstate flow of electric energy.

My answer to this question is that the energy sup-
1949 plied by the Cleveland Electric Illuminating Company to the Ohio Edison Company is delivered at South Akron.

Further than this, the energy generated within the City of Akron is inadequate to meet the requirements of Akron and vicinity, so that, from sources other than the Cleveland Electric Illuminating Company, there is also transmitted into Akron substantial amounts of energy.

Based on these facts, then, it is my judgment that energy normally sold by the Cleveland Electric Illu-
1950 minating Company to Akron, in the amounts which I have described, does not go into interstate flow of electric energy.

By Mr. Binford:

Q. Mr. Lindseth, you were present at some of the earlier sessions of the hearings in this matter, at which Mr. Lank—

—997—

an engineer of the Potomac Electric Power Company—testified, were you not? A. Yes.

1951

Q. Were you present at the time he testified relative to the several committees of representatives of operating companies within the North American holding company system? A. Well, I am not sure that I was present at all those sessions, no.

Q. You read his testimony in regard to those committees, did you not? A. No, I am not sure that I have read his testimony in regard to all those committees, no, I am not sure of that.

1952

Q. You are not familiar with the testimony given by him with regard to those committees? A. No, I don't believe I am.

Q. On direct examination, you testified at some length as to the activities of the several committees of the type indicated, which you identified in your testimony. Immediately prior to your testimony in that respect, I presume you refreshed your recollection as to the activities of those committees, is that correct?

The Witness: Will you read back that question?

1953

(Whereupon the pending question was read back by the Reporter.)

The Witness: Yes, that is correct.

—998—

By Mr. Binford:

Q. Some of your testimony, I presume, was from your own knowledge and recollection? A. That is correct.

Q. When did you last attend a meeting of any of these several committees which you identified? A. About 1935.

1954 Q. What was your position with the Cleveland Electric Illuminating Company at that time? A. I was production engineer.

Q. What was that committee, the meeting of which you attended in 1935? A. The Station Advisory Operating Committee.

Q. Have you ever attended a meeting of any other of the several committees which you have described? A. No, I have not.

1955 Q. You have not read over the testimony of Mr. Lank upon cross-examination, with relation to the activities of these committees? A. No, I have not.

Q. Or Mr. Thielscher, who also testified here? A. I have read the testimony of Mr. Thielscher—or parts thereof. I wouldn't vouch for having read it all.

Q. Mr. Thielscher, I believe, testified that he was a mechanical engineer in the employ of the Potomac Electric

—999—

Power Company, and as such familiar with certain activities of certain of these committees. Is that your recollection?

1956 The Witness: Will you read back that question?

(Whereupon the pending question was read back by the reporter.)

Mr. Binford: If the witness isn't certain as to the answer to that question, I would substitute this question:

By Mr. Binford:

Q. You know, as a matter of fact, do you not, that Mr. Thielscher is a mechanical engineer in the employ of the

1957

Potomac Electric Power Company, in which capacity he testified here in this proceeding? A. Except that I don't know that "mechanical engineer" is his title, but I do know that he represents the Potomac Electric Power Company on the Station Advisory Operating committee.

Q. I was speaking of his profession rather than his title.

Do you agree with Mr. Thielscher's view that, even were the stock ownership of the several companies represented in the Station Advisory Operating Committee wholly divorced, yet the same technical benefits would accrue to the respective companies from a continuance of these committees and their activities?

1958

Mr. Hamilton: May that question be read back, please?

—1,000—

(Whereupon the pending question was read back by the reporter.)

Mr. Hamilton: Mr. Examiner, I will have to object to that question, because I don't think it correctly states Mr. Thielscher's views expressed in the testimony.

1959

Mr. Binford: I think it does.

The Examiner: Off the record.

(Discussion off the record.)

Mr. Binford: In view of Mr. Hamilton's objection, but without conceding its validity, I will add to the question to the witness:

1960 *Elmer L. Lindseth—By Respondents—Cross*

By Mr. Binford:

Q. My question presupposes that there could be a continuance of the activities of these committees and their members, among themselves, in the same manner and with the same freedom that they are carried on now.

In other words, I am not asking the opinion of the witness as to whether or not, if there were no single rate stockholder holding stock in each of these companies, the arrangement would be likely to be carried on or not, but my ques-
1961 tion is directed to the point of whether, if such activities could be carried on in the absence of holding company control, if the same technical benefits would not accrue to the companies as accrue at the present time.

Mr. Hamilton: Now the question has been phrased and rephrased two or three times in counsel's last

—1,001—

statement. May I ask: Is the witness to assume that the conditions to be assumed in his expression in the first restatement are also the conditions to be assumed
1962 on the second restatement of the question?

Mr. Binford: Yes, sir.

The Witness: Will you read back the last part of Mr. Binford's question, which begins, "My question is directed to whether—" and so forth?

(Whereupon the pending question was read back by the reporter.)

The Witness: Well, in spite of the desire of Commission counsel that this question be answered without regard to the premises, I don't believe that the

question can be so answered, because the premises are impossible; being impossible the question is moot.

—1,002—

By Mr. Binford:

Q. Would the sale by the North American Company of all of its stock interests in Potomac Electric Power Company affect the validity and the usefulness to your company, the Cleveland Electric Illuminating Company, of any fuel analyses made in the laboratories of Potomac Electric Power Company of fuel for your company? A. Again we have a 1964
hypothetical question asking for me to express an opinion about a set of circumstances which have not occurred and are purely in the realm of speculation.

Q. Precisely. A. Do you want me to speculate?

Q. I want you to speculate in the light of your expert knowledge and give your expert opinion on this particular question. A. A number of questions here have been premised on a hypothetical situation which would prevail were there to be certain very major readjustments in the ownership of these properties. It is my opinion that were these hypotheses about which Commission's counsel has asked me to speculate 1965
to take place, that there would not be the same community of interest existing among these several companies as now exists by virtue of this community of ownership.

That is, the work of these committees is a substantial work. The getting out of these reports is tedious. The benefits are substantial, yet they are not without a real sacrifice

—1,003—

in expense and effort on the part of the companies.

Specifically he has asked me in the matter of the analysis of coal. This requires the preparation of samples by the

several companies, analyses under unusual conditions in the laboratories, some disruption of normal procedure, all of which are cheerfully tolerated when there is this community of interest and the full realization of the benefits, but under the hypothesis of Commission's counsel that this community of interest be lost then it is my judgment that there would occur a time when under the rush of other business or the stress of adversity this job just would not be done and committee work would come to the same pass that
1967 it often comes in engineering societies, in other technical committees, where the representatives on the committee say "Well, it isn't worth it. We will drop it."

So, the answer specifically to Mr. Binford's question in this realm of speculation which he has asked me to explore, is that those benefits would not be continued.

Q. And you would not consider it to the interest of the several companies that they be continued? A. In my judgment it would be in the interest of the several companies to have this continuance, but I would be very reluctant to think they would be made to succeed; their value would be
1968 just as great could they succeed, but I am quite certain of my belief that they could not be made to succeed without this community of interest. The premises of these questions have been impossible.

—1,004—

Q. You speak of community of interest; do you mean community of control? A. By this community of interest I refer to this situation that the advantages derived from mutual cooperation among the several members of the committee accrues to the benefit of all companies in a financial way. This is a selfish interest. This is not a desire to add

to the fund of human knowledge, per se. This is not a desire to indulge in pure science as an end in itself. This is an effort to derive substantial economies in operation by virtue of this community of interest or this unity of ownership.

Q. Now, you think that that motivation would disappear upon the part of the management and officials of these several companies if they were responsible to scattered security holders rather than to scattered security holders plus an outstandingly large holder of common stock common to all of them, is that true? 1970

The Witness: Will you now read that back?

(Pending question was read.)

The Witness: The difference in the present situation and the hypothetical situation posed by this question is this: Under the hypothetical situation there would be an earnest desire on the part of every representative to derive all the benefits he could, sure; that is only natural and human nature. The weakness of the picture lies in the extent to which those participants would be willing to, at some sacrifice in 1971

—1,005—

time and expense, contribute to the efforts of the committee knowing that the benefits therefrom were to accrue to a company disassociated in its ownership.

By Mr. Binford:

Q. However, under the present arrangement isn't it true that insofar as the public security holders, by which I mean the security holders other than the North American Company and the Cleveland Electric Illuminating Company are con-

cerned, the Cleveland Electric Illuminating Company does expend money and the time of its experts and employees, which represents money belonging in part to these public security holders, for the benefit of the Potomac Electric Power Company in which such security holders may have no interest at all?

Mr. Hamilton: I think counsel means Cleveland Electric Illuminating Company.

Mr. Binford: Read the question.

1973

(Pending question was read.)

Mr. Binford: In that the Potomac Electric Power Company is one of the other members of this group which cooperates through committees.

Mr. Hamilton: That question is a little puzzling to me as now framed. I wonder if the stenographer would mind reading it back once more with the amendment just added.

(Pending question and amendment read back.)

—1,006—

1974 The Witness: I am of the opinion that the Cleveland Electric Illuminating Company now, and for a long time in the past, has received benefits from its inter-company committee participation in excess of the cost thereof. That is, while we have contributed substantially we have received benefits several times greater. We hope that we have contributed to this committee effort in such amount and of such quality that there has resulted benefit to the stockholders of the Potomac Electric Power Company.

1975

I am, however, not of the belief that without this mutuality of interest, this community of interest, to which I have referred, that in the long range picture we would be willing to continue the extent of these contributions. That these contributions have been of benefit to stockholders of other associated companies goes without saying almost. The Company has no reluctance for its contributions, feeling that these have been repaid many times.

1976

By Mr. Binford:

Q. So that if you continue to occupy your present position with Cleveland Electric Illuminating Company at a time when that company has ceased to be a part of the North American System, you would not recommend the continuance of the community activities to which you have testified?

The Witness: Will you read that question, please?

(Pending question read back.)

The Witness: That is not at all the case, nor is that a valid assumption from what I have said. I have previously testified that it would be with considerable

1977

—1,007—

reluctance that I would recommend the continuance of these committees, well realizing the benefits that we now derive therefrom and the loss which would accrue to the Company in the event those benefits were to cease, but I would be decidedly pessimistic as to the success of this activity without the guidance of a strong stockholder. With the community of interest missing, the success would be far less assured.

1978 *Elmer L. Lindseth—By Respondents—Cross*

Mr. Hamilton: Would you read that answer back again?

(Last preceding answer read back.)

By Mr. Binford:

Q. Then, would it be a fair statement of your opinion that the managements of these several companies in the North American System are primarily guided in their expenditure of funds and in their activities, particularly in relation to
1979 the committees which we have been discussing, by the general interests of their respective largest voting stockholders throughout all its investments rather than by the interests of investors in general of the particular operating company of which that happened to be in charge?

Mr. Hamilton: I don't know as the witness has been qualified to testify as to what the management of other companies might conclude.

Mr. Binford: He is expressing an opinion as to what would happen and what they would do if certain motivation were removed. I would like him to clarify
1980 —1,008—
it.

Mr. Hamilton: I am not objecting to the question. I am merely pointing out the vagueness of the premise.

The Witness: Will the stenographer read back the question commencing, "Would it be a fair statement of your——"?

(Indicated question was read back.)

The Witness: I am answering this question from the point of view of the Cleveland Electric Illuminating Company management alone.

1981

We, as a company, are convinced that the values derived from these committees is substantial. We are convinced that the expenditure of time and effort of the employees and other out-of-pocket expenses is repaid many times by the benefits derived. In considering the relative value of the benefits and the expense or cost thereof, we are concerned not with whether stockholder A or stockholder B benefits specifically therefrom, we are concerned with the welfare of the Company.

1982

Those of us engaged in private business develop a philosophy toward our company. It is an end in itself to be worked for. The judgment of management is very often governed by the single criterion, "Will this be good for the Company?" in determining the economics of an expenditure, not "Will it be good for stockholder A who owns a part of that company?" and not "Will it be good for stockholder B who owns a part thereof?" but rather, "Will it be good for the Company?"

—1,009—

1983

Incidentally, of course, prosperity for the Company means return for the stockholders therein. It is the position of the Company, however, which controls in a choice such as this. However, in considering the expenditure of effort by company A for the benefit of company B, when the immediate prospect in that minute effort might be an excess of expenditure by the original company in excess of benefits derived, weight must just humanly be given to such a decision if it is known that there be a mutuality or a community of interest between company B and company A.

1984 *Elmer L. Lindseth—By Respondents—Cross*

This is only a discourse into human nature. There is no engineering or philosophy of economics involved in a question such as that.

Q. You spoke, in your direct testimony, of a number of rate reductions effected by Cleveland Electric Illuminating Company to its customers as voluntary rate reductions. Were any of those rate reductions approximately contemporaneous with the expiration of a franchise in a particular community? A. No.

1985

Q. They were truly voluntary in each case? A. As I testified in the matter of regulation in Ohio, the primary regulating power is in the City Councils under the provision of Home Rule. Some of these reductions were contemporaneous with the expiration of rate agreements or contracts with such municipality without involvement of a franchise. The rate agreement between the Company and each of the

—1,010—

cities it serves is for a fixed period, not in excess of ten years. Some of these reductions were contemporaneous with the time for renewal of such rate agreements or contracts.

1986

Q. Did any of the reductions precede by more than a few months the time at which a new agreement would have to have been reached? A. Yes, such voluntary reductions did so precede the expiration of ordinance periods. For example, the Company in 1933 made a voluntary reduction and got an extension of its existing agreement until 1939 as a result thereof, or as a corollary thereof. By 1937 at a time when the agreement had two years to run there was made a further voluntary reduction on the part of the Company in substantial amount.

1987

Q. Now, you also testified as to the reason for organization of Power and Light Building Corporation, substantially to the effect, as I recall it, that when that corporation was organized it was believed that the building to be owned by it would not be occupied wholly by Cleveland Electric Illuminating Company, but a certain portion of it would be leased or rented to others which was beyond the scope of the activities of Cleveland Electric Illuminating Company. Is that substantially correct? A. Yes, that is substantially correct.

1988

Q. But I believe you further testified that later Cleveland

—1,011—

Electric Illuminating Company became the tenant of the entire building. A. That occurred about 1923.

Q. Since that time has Cleveland Electric Illuminating Company occupied the entire premises, that is to say to the exclusion of other tenants? A. As the sole tenants, yes.

Q. It is mere inertia that has kept the separate corporate organization of Power and Light Building Corporation? A. That might be the case, yes; ennui.

1989

Q. But so far as you know, no useful purpose at the present time is served by the continuance of that corporation as a separate entity? A. None to my knowledge as a separate entity.

Q. Is any portion of the property owned by that corporation included in the rate base of the Cleveland Electric Illuminating Company? A. Will you define what you mean by the rate base?

Q. That is included in the property which is used as a basis for the computation of the rates, or the rate schedule

1990 to be used by Cleveland Electric Illuminating Company. A. Computed by whom now?

Q. Such regulatory bodies as have juri: iction or exercise jurisdiction over the fixing of rates. A. In the report of the engineers submitted on behalf of the Council of the

City of Cleveland on July 17, 1939, and which was used as a basis for an ordinance introduced in the Council of the City of Cleveland to fix the maximum rates of electricity to

1991 be charged by the Cleveland Electric Illuminating Company, neither the cost nor the value of that building was included.

The rent paid by the Cleveland Electric Illuminating Company to the Power and Light Building Company in an amount of $40,000 per year was included as a deductable operating expense in determining return, but such rent in the amount of $40,000 is adequate only for three purposes: (A), the payment of taxes; (B), the payment of insurance; and (C), allowance for depreciation.

There is no rate of return included in the $40,000 of rent paid by the Cleveland Electric Illuminating Company to

1992 Power and Light Building Company, so that its inclusion in the determination of the rates for the City of Cleveland contemplated no return thereon, even though the book cost thereof is about of the order of $1,100,000.

Q. No return for the ownership of the corporate stock of that company by Cleveland Electric Illuminating Company as distinguished from the physical property of the subsidiary company? A. Well, under these circumstances there are obviously no dividends to be paid on the stock which the Cleveland Electric Illuminating Company owns in the Power and Light Building Company, so that as of the year being

studied, 1938, the rent allowed by the engineers for the city

—1,013—

in fixing rates was inadequate to cover any return on the investment of the Company in Power and Light Building Company.

Q. That investment as such, though, was not given a value which was considered in the light of a capital investment? A. Not at all.

Q. If that property should be held directly by Cleveland Electric Illuminating Company without the intervention of 1994
a subsidiary corporation, do you know whether it could be considered as properly such a part of the property plant investment of the Company as to be taken into consideration in the fixing of rates? A. In my judgment it could be very properly that. It is devoted solely to utility service for the use and convenience of the customers of the Company.

Q. Are you a member of engineering societies? A. I am a member of the American Society of Mechanical Engineers and the Cleveland Engineering Society.

Q. Are you active in those organizations? A. Within
modest limits of what constitutes being active, I am active in 1995
the American Society of Mechanical Engineers, but not in the Cleveland Engineering Society.

Q. There is some interchange of technical information among the members of such societies, is there not? A. Yes, there is.

Q. There are engineering and other technical periodicals

—1,014—

and publications available to you in which recent developments in your field of work are treated, are there not? A. Within the limits of the definition of "recent"; "recent" as defined as shortly after the fact, very rarely before the fact.

1996 *Elmer L. Lindseth—By Respondents—Cross*

Q. Among the subjects of periodic discussion by special or standing committees within the North American System, is there included public relations?

Mr. Hamilton: What was that question?

(Pending question read back.)

The Witness: Public relations for an electric utility comprises every move we make. For example, in the design of the power plant now being constructed
1997 at East 70th Street, from a point of public relations purely there is being installed a very considerable dust arresting equipment from the stacks to reduce atmospheric pollution.

There is a case where the engineer in charge of the design and construction of a power plant makes a very substantial expenditure of money on behalf of the Company for the reduction of atmospheric pollution because we feel that it is in the interest of Cleveland that that atmospheric pollution be reduced.

Now, this is typical of every act which controls
1998 every thinking employee of the utility, whether he be a meter reader, whether he a trouble man, a line construction man, an underground foreman, a truck driver, an advertising man, or a publicity man.

So that the answer to the specific question, whether among the subjects for discussion is there included

—1,015—

public relations, is that the accounting committee in its discussion of bill collection policies and procedures is motivated in very large measure by public relations. The advertising department of our Company, in looking over advertising submitted by other member com-

panies for ideas, is well alert to the advantages which may be obtained therefrom to improve public relations.

Similarly our power engineers are constantly alert for means to improve public relations within their sphere. The answer to your question, then, is that every act is unquestionably analyzed consciously or subconsciously from its public relations angle.

Q. The answer to the question then, is "Yes"? If you were required to answer "Yes" or "No", your answer would 2000
be "Yes", is that right? A. That isn't a question amenable to a "Yes" or "No" answer. Public relations is not a thing which can be bandied about like a ton of coal or a load of bricks. Public relations is a philosophy of management of a company and it is a philosophy of operation of that company and that question "Do you discuss public relations?", as though it were Item IV on the agenda—"What are we going to do for public relations today?"—that question is not amenable to a "Yes" or "No" answer.

Mr. Binford: No further questions. I reserve the same right with respect to this witness to recall him 2001
for examination although I intend no further exam-

ination at length, as reserved heretofore in respect to the other witnesses.

Mr. Hamilton: And as in the case of other witnesses, Mr. Examiner, we do not concede the general reservation of the right to cross examine for the reasons and on the basis indicated previously.

The Examiner: Well, that brings up the question of who will pay the expense of this witness to bring

2002 *Colloquy*

him back. I think counsel for the Commission ought to finish his cross examination while he is here. If it occurs to him later on and he needs to recall him, then we will have to take up the question of who is going to pay the expense of bringing him back here but until that question arises we won't debate it and I won't pass on it.

Mr. Hamilton: Mr. Examiner, as I have indicated previously to counsel for the Commission, Mr. Brown-
2003 ing is still ill and I don't anticipate now that he will be able to get to Washington until Wednesday night at the earliest. I understand that counsel is willing that the testimony of the next witness be taken up on Thursday morning under the circumstances.

Mr. Binford: I agree with that. I understand that if it unfortunately develops that Mr. Browning still can't be here, that Mr. Hamilton will be ready to go ahead with the next witness at that time.

Mr. Hamilton: If Mr. Browning isn't available on next Thursday I will expect to go ahead myself, but it
2004 so happens that the next witness' testimony involves

—1,017—

phases of the case which at this time I am not familiar with. However, under those circumstances I will go ahead on Thursday if Mr. Browning is not available.

The Examiner: Very well, we will continue this matter until Thursday morning at ten o'clock a. m.

(Whereupon, at 12:00 o'clock the hearing was adjourned to reconvene Thursday morning, August 15, 1940, at 10:00 a. m.)

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

2006

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1101,
Securities and Exchange Commission Building,
Thursday, August 15, 1940,
Washington, D. C.

2007

Met, pursuant to recess, at 10 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

(As heretofore noted.)

2008 *Charles F. Schaber—By Respondents—Direct*

PROCEEDINGS

The Examiner: Are you ready to proceed?

Mr. Browning: Yes.

The Examiner: The hearing will come to order.

Mr. Hamilton: Mr. Schaber.

Whereupon, CHARLES F. SCHABER called as a witness on behalf of the Respondents, being first duly sworn, was exam-
2009 ined and testified as follows:

Direct Examination by Mr. Hamilton:

Q. Would you give your name, please? A. Charles F. Schaber.

Q. Your address? A. Bucyrus, Ohio.

Q. Were you formerly a member of the Public Utilities Commission of Ohio? A. I was.

Q. For what period? A. I became a member of the Ohio Commission in January 1933, and served until the first of February 1939.

2010 Q. And, during that period, did you serve as Chairman of the Commission? A. I served as Chairman of the Commission the last two years of that period.

—1,020—

Q. Prior and subsequent to the period of your service as a member of the Commission, were you engaged in the practice of law? A. I have been engaged in the practice of law in Ohio since 1901. I practiced before I went on the Commission, and then engaged in general practice since I retired from the Commission.

2011

Q. In what year did regulation of electric utilities by the Public Utilities Commission of Ohio begin? A. The first enactment, creating commissions for regulation of utilities generally, including electric utilities, was in 1911. At that time the Ohio Public Service Commission was created and a year or two after that the name was changed to the Ohio Public Utilities Commission—or, rather, the Public Utilities Commission of Ohio.

Q. Will you describe the extent of the Commission's staff? A. Well, in recent years, during my term of service, 2012
we had approximately 90 official employees. They consist of clerical force, engineers, accountants, investigators, and inspectors.

Q. In what respects does the Public Utilities Commission of Ohio regulate electric utilities in the state? A. Well, that is a broad question. The statutes of Ohio confer the power upon the——

—1,021—

Mr. Binford: Mr. Examiner, I object to any statement by the witness as to what the statutes of Ohio provide, in view of the fact that such statutes them- 2013
selves are the best evidence of what they provide.

A stipulation was entered into at the beginning of this case, that the laws of the several states, as they may enter into consideration of this case, relating to public utilities and regulation thereof, might be officially noticed by the Commission, which stipulation, I believe, was suggested by counsel for Respondents and assented to by me.

In view of that fact, I insist on the objection to any statement as to what the laws provide, on the

2014 *Charles F. Schaber—By Respondents—Direct*

ground that that is not the best evidence, and the best evidence is already by stipulation officially before this Commission.

Mr. Hamilton: Mr. Examiner, my question didn't relate specifically to what the statutes may or may not provide.

Mr. Binford: My objection is not to the question; my objection is to the statement of the witness.

2015 *By Mr. Hamilton*:

Q. I would like to have the witness describe, if he will, what, in fact, the Public Utilities Commission of Ohio does in respect to regulation? A. Well, the Ohio Commission has prescribed the classification of accounts and utilities are required to, and do, conform to that accounting procedure and practice.

—1,022—

The Commission considers, of course, the matter of adequacy of service being rendered by the utility, keeps in touch with the operations of the utilities to ascertain whether the
2016 service is adequate.

Rates are fixed and determined by the Ohio Commission in certain instances. Other rates are fixed and determined by counsel of the various municipalities of the State.

The Commission also authorizes security issues and investigates complaints, corrects abuses if any have been ascertained or discovered.

The Commission also inquires as to matters of discontinued service, extension of service, and generally supervises the operations within the jurisdiction of the Commission.

2017

The acquisition of property is a matter that is also acted upon by the Commission. Contracts between utilities are acted upon, must have the Commission's approval. And many other functions that I just can't recall at this particular time.

The Commission keeps in close contact and touch with the operations of the various utilities that operate in the State of Ohio.

Q. Does the Commission regulate the issuance of securities by public utilities? A. It does.

2018

Q. Can you state whether, from your experience on the

Commission, you know whether The Cleveland Electric Illuminating Company has filed with the Commission statements of property additions and retirements? A. That is correct. That Company does file, I believe, semi-annually, a report as to additions to plant and retirement from plant.

It is the only utility that I have any recollection of that does that particular thing, as far as filing of those semi-annual reports with the Commission.

2019

That is not an absolute requirement on the part of the Commission. They do that voluntarily.

Q. From your experience, will you state whether the size of the electric utility being regulated by the Public Utilities Commission of Ohio in any way affects the effectiveness of the regulation by that Commission? A. I would say not.

Q. In other words, a large utility is not more difficult to regulate than a small utility? A. I would say it is not. Size I do not consider has anything whatever to do with the effectiveness of the regulation.

2020 *Charles F. Schaber—By Respondents—Cross*

Q. Are you aware of the fact that voting stock control of The Cleveland Electric Illuminating Company is held by The North American Company? A. That has been my understanding.

—1,024—

Q. In your opinion, has the fact of such voting stock control restricted or obstructed regulation of The Cleveland Electric Illuminating Company by the Public Utilities Commission of Ohio? A. It has not in any way affected the
2021 regulation of the operating company.

Q. What effect does the existence of such control have on such regulation? A. That doesn't enter at all into the matter of regulation on the part of the Ohio Commission.

Mr. Hamilton: That is all.

Cross Examination by Mr. Binford:

Q. How many members are there on the Ohio Commission? A. There are three members appointed by the Government.

2022 Q. You served from 1933 through 1939? A. Yes. 6 years.

Mr. Binford: No further questions. Same reservation as made in respect to other witnesses.

Mr. Hamilton: And again the same comment on our part, Mr. Examiner.

Mr. Browning: Could we have an understanding that we always object to Mr. Binford's reservation, so that we wouldn't have to state it each time.

The Examiner: Yes. I think that is proper to be added on the record at this time.

—1,025—

 2023

Mr. Binford: We will try to make it shorter each time.

Mr. Browning: Mr. Crawford.

Whereupon, EBEN G. CRAWFORD called as a witness on behalf of the Respondents, being first duly sworn, was examined and testified as follows:

Direct Examination by Mr. Browning: 2024

Q. Will you give your name and address to the Reporter, Mr. Crawford? A. My name is Eben G. Crawford, 2864 Eaton Road, Shaker Heights, Ohio.

Q. Mr. Crawford, you are president of The Cleveland Electric Illuminating Company? A. I am.

Q. Will you describe briefly your education and business experience? A. I was born in Franklin, Pennsylvania, a small town in what we call the oil country in western Pennsylvania, in 1883.

My father was a small-town banker. I lived in Franklin, going to the Franklin schools and graduating from the 2025 Franklin High School in 1900.

I entered Dartmouth College in the fall of 1900 and was

there one year. I returned to Franklin, got a job in a bank as messenger.

I worked in that bank until 1910, at which time—of course, I say it was a very small bank, a small organization, —and I retired in 1910 from the bank as assistant cashier. I bought a jewelry store in Franklin and ran, or misran, that jewelry store for three years, and sold out.

2026

I was married by that time and had a small family. My next job was with the Venango Manufacturing Company, which was a small local concern, with a foundry and machine shop, making patented appliances for use on railroad locomotives. I went in there as a machinist assistant and did all sorts of jobs around the plant.

I was there for three years. The last year——

Q. (Interposing) Beginning in 1913? A. Beginning in 1913; that is right.

2027 The last year I was engaged in selling castings—gray iron castings. They had a foundry that was larger than their own needs and I conceived the idea that we might sell some castings, so for a year I traveled around western Pennsylvania selling castings for this concern.

In November, 1916, I went to Cleveland, where I was employed by an investment banking house as a bond salesman. I did fairly well at that, until the war broke out, when I entered the Liberty Loan Organization in Cleveland. That was a government organization for the selling of liberty

—1,027—

2028 bonds. I was assigned five counties in northeastern Ohio, over which I had supervision in the matter of selling these bonds.

At the close of the war, and when I stopped selling liberty bonds, I remained with the Federal Reserve Bank of Cleveland for a year or a year and a half, selling United States treasury certificates to banks in those five counties.

Q. Those five counties are the same counties which comprise the present territory of the Illuminating Company? A. They were Cuyahoga, Lake, Geauga and Ashtubula, which

are in the territory of the Illuminating Company, and Mahoning County in which Youngstown is located.

Then I also, during that period, was working on the matter of inducing non-member banks, of which there were a good many in those days, to join the Federal Reserve System, and I was able to get a number of them to do that.

In the fall of 1920 there was a merger of three of the large Cleveland banks into a new bank called the Union Trust Company, and they started with a very large bond department. The vice president in charge of that bond de- 2030
partment employed me to go to work for them and wholesale bonds among other dealers. They were engaged in originating a lot of issues. I went to work there about the first of January in 1921, and in April of 1921 I was elected secretary of The Cleveland Electric Illuminating Company.

—1,028—

I went to work there about the 15th of April and I have been there in one capacity or another ever since.

Q. Tell us what your capacities with the Illuminating Company have been. A. Well, I was elected secretary of the Company, as I say, in April 1921, and I continued as secre- 2031
tary for the Company until—that was my official title—until February of 1933, when I was made vice president and secretary.

On the death of Mr. Lindsay, the president of the Company, late in August of 1933, I was made president of the Company.

Mr. Lindsay had been critically ill for two years before his death. The last year of his life he spent down at Charlottesville, Virginia. He had built a house down there and wanted to be there because he could get treatment, for the

2032 *Eben G. Crawford—By Respondents—Direct*

illness that killed him, from specialists in the University of Virginia.

He had been practically incapacitated for two years before that, and it devolved upon me to rather take over the running of the Company, particularly the contacts with The North American Company in New York, so that it was pretty well decided, before Mr. Lindsay's death, at the time I was made vice president in the spring of 1933, I think, it was pretty well understood that upon Mr. Lindsay's death I
2033 would remain president of the Company, and I was so elected in September of that year.

—1,029—

Q. You have resided in Cleveland for the period from November, 1916, to date, then? A. That is right.

Q. Mr. Crawford, are you a director of any corporations or organizations other than the Illuminating Company? A. Yes, I am a director of the National City Bank of Cleveland, and have been since 1933.

I am a director of the Wheeling & Lake Erie Railroad, and have been since 1933, I think.

2034 I am on the Board of Trustees of Cleveland College and I am on the Board of Trustees of the Cleveland Regional Association, which is a civic association, planning the future development of Cleveland, as to highways and zoning and improvement of the metropolitan area.

I was for a number of years chairman of the Depositors Committee of the Union Trust Company, which Union Trust Company was closed at the time of the banking crisis in 1933. I was chairman of the Depositors Committee until a new bank was organized in 1938—the Union Bank of Commerce—to take over the unliquidated assets of the bank and

2035

pay out and liquidate the assets and make further payments to depositors.

That committee was dissolved upon the completion of the formation of the new bank.

I was also president, in 1936, of the Great Lakes Ex-

—1,030—

position, which was patterned after the Century of Progress in Chicago, operated for two years in Cleveland, and brought a lot of people into the town and was an aesthetic success if not a financial one.

2036

(Discussion off the record.)

Q. Will you please describe the organization of the operating staff of the Illuminating Company? A. The operating staff is responsible to the Board of Directors through the president, through the vice president and general manager, who is in charge of the general operations of the Company, the vice president and treasurer, the vice president in charge of sales, and the secretary and the comptroller.

The president also has three assistants, and we have Mr. Frank M. Cobb, who has been our general counsel for many years, with offices right in our building, who devotes all his time and practice to the affairs of the Company.

2037

In general charge of operations is Mr. H. W. Hough. Mr. Hough has been with the Company——

Mr. Browning: Just a minute. Off the record.

(Discussion off the record.)

A. (Continuing) Mr. Hough has been with the Company for thirty years, has lived in Cleveland all that time, starting with the Company as an engineer, became research engineer.

—1,031—

Then he became assistant to the president, when Mr. Lindsay was in charge of the Company, and, upon my election as president of the Company, he was elected vice president and general manager, and put in charge of the general operations of the Company.

The vice president and treasurer, Mr. Charles W. Mills—Mr. Mills is a man 71 years old, who has lived in Cleveland all his life. He has been with the Company since 1893, 47 years.

2039 He started in as a bookkeeper. In 1893 the Company was, of course, just a baby, and he has been treasurer of The Cleveland Electric Illuminating Company since 1921. He was born in Cleveland. He lives in East Cleveland, East Cleveland being, as you know, contiguous to Cleveland. The only way you can tell the difference is the fact that there is a municipal border line across there.

He is in charge of the treasury department. He has 86 employees in the various branches of that department. He is responsible for the receipts and checks and money and bills and bank accounts, and similar property.

2040 He has an assistant treasurer and has a collection department under his jurisdiction.

And we have an assistant secretary and an assistant treasurer—Mr. C. L. Mills—who is no relative of the other Mr. Mills.

—1,032—

Mr. C. L. Mills is a man 59 years old. He has been with the Company 40 years or 41. He has charge of the minute books of the subsidiary companies, Employees Fund—I don't know whether it has been described by the other witness or not—and also the records of the pension fund, and he signs

as assistant secretary or assistant treasurer, when such signature is required.

Mr. C. W. Mills, vice president and treasurer, also has under his jurisdiction the collection department. It is a very important department of the Company.

The head of the collection department is Mr. Harry D. Ballard, who has been with the Company 26 years and is a born Clevelander.

His department supervises credit arrangements, collection of delinquent or past-due accounts. They make adjust- 2042
ments of complaints or errors in billing; they make settlements of any customer complaints involving money, and they maintain the contacts and relations with the many paying agents which the company has.

Our customers can pay bills at any one of the branches of the Cleveland Trust Company, which has about 52 or 53 branches; of the Central National Bank, which has about fifteen neighborhood branches, and then, where those branch banks are not conveniently located, we have set up agencies in stores in some little shopping sections, so it is no hardship, it isn't difficult for a customer to go and pay his bill, 2043

—1,033—

and the collection department maintains those contacts and sees that the arrangements are properly carried out.

The vice president in charge of sales is Mr. H. C. Gillie.

Q. Is that H. C.? A. H. C. Harry C.

He has been with the company 33 years. He came to Cleveland from the West in 1898 and has lived in and around Cleveland ever since. He went through Case School, graduated as a mechanical engineer, came into our power sales department shortly after.

2044

He was a power salesman; then he was promoted to be in charge of all the power salesmen and in 1933, when I took over the presidency, he was made sales manager.

His predecessor, who had grown old in the business, was retired. In 1935, at my suggestion, the Board of Directors elected him vice president in charge of sales.

It didn't change his duties or his responsibilities any but we felt that it would give him a better standing among the large power buyers, and so, since then, he has been vice presi-

2045 dent in charge of sales.

He has about 150 employees in industrial, commercial, and residential sales.

Under him, in charge of domestic sales—that is, sales

—1,034—

to residential consumers, is Mr. J. E. North, who has been with the Company 21 years, has been in Cleveland all that time and has been president of the Electrical League all during that period.

Mr. North has a staff of 83 workers in residential sales promotion, and some of those men also work in cooperation

2046 with the dealers in the distribution of appliances.

Mr. North is an employee of the Company in charge of domestic sales, and he also directs the Electrical League. I think our Cleveland Electrical League was the first institution of that kind, and has been used as a model quite frequently by other companies.

Mr. North participates, with Mr. Gillie and myself and Mr. Ryan—one of my assistants in charge of advertising—in the preparation of sales campaigns, booklets, mail advertising, and newspaper advertising as well.

He makes a lot of public addresses before schools and societies, particularly on the advantage of proper home lighting, and he has been very successful in that field.

The secretary of the Company is Mr. Sidney Hall, a young man. He has been with the Company seven years. He was made secretary in 1935. He was born in Cleveland, lived there all his life.

He does the usual things that secretaries do. He keeps the official records of the company, records of the corporation, deeds and franchises; he records the minutes of direc- 2048

—1,035—

tors' meetings.

He is in direct charge of our insurance. He is in charge of a revolving fund which we have to make loans to employees who are in some pressing need of money, and whom we found a good many years ago were apt to get in the hands of these loan sharks at the rate of three per cent. a month, and we set up this fund whereby an employee who had a good record and could show a real need for it, could borrow money from the Company and pay it back, over a period of a good many months out of his pay checks, for which we charged 2049 him no interest rate.

Mr. Hall has the administration of that fund. He also has charge of that pension fund, our group life insurance, that provides for the hospitalization of employees, to which about two thirds of our employees belong.

That movement has had a very wide growth in Cleveland. For a small sum each month, to be deducted from their pay, the employee confined can have his hospital requirements paid for without any great burden at any one time, and Mr. Hall is in charge of that.

2050 He gets out the reports to the trustees, stock exchanges, S. E. C.; he gets out the dividend checks; he gets out all financial information for clearing houses; he directs the Company's stock transfers to registrars and bond coupon agents.

—1,036—

He does all the things that a secretary of an organization of this size and scope would be expected to do.

The comptroller of the Company is Mr. R. H. Smith. He
2051 has been with us for—he is 46 years old; he has been with us since 1924.

He came to us from Price, Waterhouse & Company. He has been comptroller since 1928, lived in Cleveland since 1921, lives in Shaker Heights.

He has general charge of all the accounting activities of the Company and prepares the budget, and he controls the work orders and he gets out the job orders, controls expenditures under the budget, has general charge of consumers' billing, accounts receivable and payable, general ledgers, tax reports, and has under him, of course, quite a large super-
2052 visory staff.

Our consumers' accounting department, which get out monthly bills, about four million a year, is under Mr. H. R. Skirving. He has been in charge of that department for many years.

That is a department of about 125 employees, mostly girls. We do mechanical billing and daily billing. Bills go out every day of the month. We don't have, as many companies do, a particular day of the month for mailing out bills.

Mr. Skirving is in charge of that. It is a department with which we have had a good deal of trouble, on account of

having so many girls in it. Mr. Skirving is an old man, who has been there a long while, and he is like a school teacher to them; he does like a school teacher does to a class, and we have had no trouble whatever since Mr. Skirving went in there.

The auditor is Mr. Scholley. Mr. Scholley has charge of the general accounting of books of the Company, getting out of checks, verification of orders and invoices.

He prepares tax reports, financial statements. He has a large staff of accountants under him. 2054

Also under Mr. Smith, the comptroller, is the budget accounting division under Mr. H. C. Patmore—P-a-t-m-o-r-e. He has been with the Company 19 years, has always lived in Cleveland.

He supervises, under the comptroller, all the accounting of the budget. He is in direct charge of the budget for operation, for new construction, for replacements, retirements. He gets out all work orders and sees that those work orders are closed when the work on them is completed.

Also under the comptroller is the construction cost division. That is under Mr. F. E. Stoller—S-t-o-l-l-e-r. He has 2055 been with the Company since 1921 and has been superintendent of construction costs since 1924.

He has in his department 33 employees. He is responsible for the estimates of contruction costs prepared by the Company and the checking of costs and estimates by con-

tractors. We do our own engineering. We do not—we haven't for many years employed outside engineers for the design or construction of plants or sub-stations or any buildings.

2056 We have our own architect and Mr. Stoller's department makes the Company's estimates of the cost of any construction project, and confers with contractors as to their estimates and our engineers and contractors' engineers sit down together and as a rule are able to agree on what is the proper cost of a project, and the contract is let usually on that basis.

Mr. Frank M. Cobb, to whom I referred earlier as general counsel for the Company, is a lifelong Clevelander, 66 years old, always lived in Cleveland.

2057 He has been with the Company since 1902. He started with the Company on a fee basis, doing general legal work for the Company in 1902, and in 1914 he was made general counsel for the Company and has been in that capacity ever since. His office is right in our office building.

He has been a member of the Board of Directors since 1912.

He has general control of all our legal work. He retains sometimes outside help, but in all legal matters of the Company he is general counsel for the company.

He devotes all his time to—and has for many years—to
2058 the affairs of the Illuminating Company.

—1,039—

The claim agent of the Company is Ralph Holcomb—He is 47 years old.

He has been with the Company for 13 years and in charge of the Claim Department for 12 years. He has a staff of eleven—claim agents, adjusters, and so forth. His department investigates all accidents, adjusts claims—he is a lawyer, a member of the bar—prepares court cases for the Company's counsel.

2059

By the way, we do not insure against public liability. We take care of all our public liability claims ourselves. We think we do it to very great advantage to the Company. We know that we save money over what we would have to pay for public liability insurance.

The costs of our claim department indicate that we make very substantial savings, but we have one very important consideration: we would much rather have the Company settle claims, either against it by some customer or against the customer by the Company, than have an insurance collector, who has no further consideration other than to get the settlement as quickly as possible and as cheaply as possible.

2060

We feel that, by the handling of our claims in that way, we maintain a very much better relationship between customers of the Company and the Company.

It has worked out very satisfactorily. We don't, for instance, insure even our automobiles against public liabil-

ity. We make all our own settlements on that. We find that we don't have accidents, because the Claim Department —Mr. Holcomb—is very, very much interested, and really in charge of our safety work, and we go into safety to the nth degree in our Company.

2061

Our employees are instructed—well, not only in their own protection, because some of their work is hazardous, but in the protection of the public. We have five hundred automobiles, approximately, in our territory. Those automobiles can either be an asset for good will or a liability for bad will, depending on how they are operated.

2062 *Eben G. Crawford—By Respondents—Direct*

Our drivers are instructed along safety lines. We hold safety meetings very regularly. There are quite serious penalties imposed for infractions of the Company's safety rules.

Mr. Holcomb is in charge of all that safety work. As president of the Company I have three assistants—one, Mr. Frank J. Ryan. He has been with the Company since 1923. He has lived in Cleveland since 1905.

Mr. Ryan is in charge of our advertising department. He
2063 prepares and supervises any public statements of the Company. He has much to do with the preparation of the annual report to shareholders, as to form.

He has entire charge of the advertising of the Company. He sits in with me and Mr. Gillie, the vice president in charge

—1,041—

of sales, and Mr. North, on, oh, dozens of conferences, I would say, each year, on sales promotion.

He is an old newspaper man. He was, for a while, managing editor of the Cleveland Press. Later he moved to New York and was in charge of one of the national syndicating
2064 organizations—I think, the News Enterprise Association, N. E. A., I think. He came to the Company in 1924 as advertising manager and four or five years ago I was empowered by the Board to employ such assistants as I needed, so I made him assistant to the president.

I have another assistant—Mr. Benjamin E. Ling, who is a man about 52 or 53 years old.

(Discussion off the record.)

A. He knows everybody in Cleveland. He keeps in constant contact with various governmental agencies. He is just an

invaluable person for a busy man to have around, getting information on what is going on in the city and what is about to go on, and he has been of great value.

My third assistant—technical assistant—is Mr. Lindseth. I think Mr. Lindseth qualified, told you what his duties were, on the stand.

Q. Now, will you describe the organization which is under Mr. Hough, as vice president and general manager? A. Well, the operating of the engineering and construction organization is all under Mr. Hough. In other words, out of the 2066

—1,042—

about 3,700 employees of the Company, about 3,300 are in the department supervised by Mr. Hough.

Mr. Hough has working with him, as executive engineer, Mr. D. C. Ober—O-b-e-r—who is 49 years old, has lived in Cleveland since 1911, has been with the Company 26 years. He has been three years in his present position.

He is responsible or in charge of all engineering—electrical, civil, mechanical, research and statistical departments, wire relations, and chemical laboratory. As a matter of fact, Mr. Ober could be characterized as an assistant vice 2067 president and general manager.

He is right under Mr. Hough and, in Mr. Hough's absence, he takes complete charge of the departments over which Mr. Hough has jurisdiction.

Mr. Ober has with him, associated with him as a mechanical engineer in executive engineering, Mr. A. A. Casey—C-a-s-e-y—Mr. Casey is 42 years old.

He has been with the Company 16 years. He has lived in Cleveland since 1920.

2068 *Eben G. Crawford—By Respondents—Direct*

As I said, we design our own plants and buildings, and Mr. Casey is a mechanical engineer in charge of plant design. In the estimate of cost of plant additions, he makes the designs or supervises the designs, he contacts contractors with Mr. Stoller in charge of the cost estimating division, he supervises the design of plants and the specifications, and he does a great deal of the purchasing in plant construction.

—1,043—

2069 We are building a plant now, 120 thousand kilowatts capacity. Mr. Casey has been working constantly on that plant design and on the specifications and on the placing of equipment with various manufacturing companies, and will have direct charge of the construction of that plant so far as the design and carrying out of the contracts, until it is completed.

Mr. Ober also has associated with him as electrical engineer in executive engineering, Mr. W. E. McFarland. He is 44 years old, lived in Cleveland since 1903, and has been with the Company for 21 years.

2070 Mr. McFarland's principal duty is an analysis of rates. We are studying rates all the time. We are studying the results of the application of rates, and Mr. McFarland sets up new rate schedule forms, he advises with me on whether a proposed rate reduction would result in a loss of revenue, what advantages it might have from a sales promotion point of view, and is in general charge of our rate studies.

Under Mr. Ober, as mechanical engineer, is Mr. C. R. Nichols, 63 years old, who has lived in Cleveland since 1924 and has been with the Company all that time.

2071

He is in charge of the building design, in charge of the drafting room, handles the architectural design of plants and sub-station buildings and other buildings being built by the

—1,044—

Company, having the coming architect under his jurisdiction, and he issues all the specifications for buildings.

The electrical engineering department is under Mr. H. L. Wallau—W-a-l-l-a-u.

Mr. Wallau is 63 years old, he has been with the Company 39 years, and he has been in charge of that department for twenty years, lived in Cleveland since 1901.

2072

He is in general charge of electrical engineering design and operation. He represents the Company on association committees.

He is on the Electrical Equipment Committee of the Edison Electric Institute; he is on the Inter-company Electrical Committee; he is on the Electric Switch Gear Committee of the association of Edison Illuminating Companies, the American Standard Association, and the American Institute of Electrical Engineers.

2073

The assistant electrical engineer is Mr. F. Borch—B-o-r-c-h.

Mr. Borch is 61 years old, he has been 19 years with the Company, lived in Cleveland since 1920. He is really in direct charge of the operations of the electrical engineering department, in the design of the electrical ends of power plants, switch houses, transmission systems, and distribution substations.

He is in charge of the selection of equipment for use in

—1,045—

the electrical department, and he cooperates with the Operating Department in all tests and in case of trouble, in finding the reasons for electrical breakdowns. He is in general charge of electrical engineering.

We have a chemistry department; Mr. J. Prescott is at the head of that.

Mr. Prescott has been with the Company 19 years. He has only been chief chemist for the last—for a few months. His predecessor died six months ago and Mr. Prescott has
2075 been in charge of the chemical laboratory since that time.

That laboratory tests fuel to see whether coal companies are delivering the coal that we are buying. We have pretty rigid requirements as to moisture, ash, sulphur contents, and our chemical laboratory tests practically every shipment that is made from each of the maybe 20 or 30 mines from which we get our coal.

They also test paints and insulation and prepare specifications for oils, such as turbine oils and transformer oils, test those oils as to their meeting those specifications. We think it has been a very valuable department in the Company.

2076 Mr. W. W. Godard is the research engineer in charge of research and statistics.

He has been with the Company 18 years, and seven years in his present position.

—1,046—

He has lived in Cleveland continuously since 1922. He gets out the statistics of the Company, makes analyses of these statistics for various purposes, supervises the statistical part of reports to governmental agencies, gets out statistics showing the results of sales promotion campaigns, and projects trends of production and sales which help to enable

2077

us to make estimates as to the future volume of the Company's business and the future requirements for plant expansion.

We have a wire relations department in charge of a supervising engineer, Mr. B. W. David. He has been with the Company for 12 years, lived in Cleveland since 1915. We have joint ownership agreements on poles with various other companies, telegraph companies.

Mr. David maintains those contacts and is in charge of those relations. He negotiates sales of jointly owned property or purchases of jointly owned property. He keeps a record of the costs, he checks line surveys for the requirements of the Public Utilities Commission of Ohio, he is in charge of transmission line crossing agreements with railroads, and he has had charge of eliminating interference with radio.

2078

In the early days of radio we had hundreds of calls, blaming our lines and our transformers for putting out static which interferred with performance of radios. That has been generally cleared up. Mr. David has had charge of that department of the Company's business, and it was quite a serious public relations problem at the time, but we haven't

2079

—1,047—

heard much of that in recent years.

Steam Superintendent—Mr. W. H. Aldrich is the steam superintendent of the Company.

He has charge of the steam end of our power plants, production of power, and also of our two steam heating plants. He has charge of the coal in the yards and operation of the boiler and turbine rooms.

2080 He, of course, at the time of the design of a new plant, cooperates very closely with Mr. Casey in the design of a plant as to what equipment shall be used, what type of installation shall be made, capacity, and the pressures and steam pressures and temperatures, so that he has a very responsible position in the design of the power plants as well as complete supervision over the operation of them.

His assistant superintendent is Mr. B. P. Ruetenik. He has been 16 years with the Company, 11 years in his present
2081 job, born and raised in Cleveland, and always lived there. Mr. Aldrich also has under his supervision the superintendents of the power plants.

At Ashtabula, which is our largest power plant at this moment, located at Ashtabula, Ohio, the superintendent is Mr. C. F. North.

He has been 30 years with the Company and in charge of that plant ever since it was built.

—1,048—

He has lived in Cleveland, or in our territory, since 1906.

In the same capacity at the Avon plant is Mr. F. J.
2082 Friedel, 48 years old, 23 years with the Company, has always lived in Cleveland.

At the Lakeshore plant the superintendent is Mr. F. C. Fletcher, 53 years old, has been with the Company 21 years and has been in charge of the Lakeshore plant for 11 years, lived in Cleveland since 1919.

In charge of the Canal Road plant and the East 20th Street steam plant, under Mr. Aldrich, Mr. R. E. Cooper, 57 years old, has been with the Company 29 years, 49 years in his present position.

Q. What is that? A. 14 years in his present position, and has lived in Cleveland since 1905.

Mr. E. C. Cawrse is production and testing engineer. He is 42 years old, has been with the Company twenty years, has been in his present job three years and has always lived in Cleveland.

He is in charge of the department which maintains the operating efficiency in power plant production. He tests power plant equipment; in charge of system design calculations and is in charge of the general technical staff, power 2084
generation.

—1,049—

In charge of our electrical department, which has complete supervision over the energy from the time it leaves the power plant until it reaches the customer, Mr. Fred S. Lewis. Mr. Lewis is 71 years old.

He has been 46 years with the Illuminating Company and before that for several years with one of the predecessor companies.

I think he entered the employ of one of the predecessor companies in 1886. He has been in charge of our electrical 2085
department for many, many years.

He operates all the transmission, distribution system sub-stations. He has a load dispatcher. He has 68 sub-stations in his department, and he may supervise the construction and installation of electrical equipment in all power plants and sub-stations.

His assistant for many years has been Mr. A. H. Nicholson who has been with the Company for 34 years. Mr. Nicholson has been with the Company for 34 years, 13 years in his present position.

2086 *Eben G. Crawford—By Respondents—Direct*

He has lived in Cleveland since 1889.

Mr. E. E. Noble, assistant general manager, with general supervision over the line department, has been with the Company for 46 years. He came in 1892, when they were building the Canal Road Plant. He has been 20 years in his present position and has lived in Cleveland since 1893. He has general supervision of the overhead line department, the

—1,050—

2087 underground lines, survey and record departments, the inspection department, which is the watchman and all the people engaged in protecting the Company's plants.

His assistant, as general superintendent of lines, is Mr. W. E. Rader, 52 years old. He has been 31 years with the Company, has been in the line department all that time—he has worked his way up through it.

Mr. Noble, as assistant general manager in charge of the lines department, has been ill for two or three years, has been unable to be on the job much of that time, and is about to be retired on pension, having reached the age of 65, and Mr.

2088 Rader will have full charge over the line department, over underground lines, from now on.

The superintendent of overhead lines—Mr. P. R. Ellsworth—50 years old and 31 years with the Company, one year in his present job, born in Cleveland and always lived there. He is just what his title implies, in complete charge of the construction, inspection and operation of the overhead lines, tree trimming activities, service installation and the trouble department.

Superintendent of underground lines—Mr. Alex Douglas—is 49 years old. He has been with the Company for 19

2089

years and in his present position for six years. He has lived in Cleveland since 1918.

—1,051—

He is in complete charge of all underground maintenance, construction and operation, and underground street lighting circuits, and in charge of the inspection of underground lines.

—1,052—

The superintendent of Inspection is Mr. B. S. Howlett. He is 55 years old. He has been with the Company for 31 years, 19 years in his present job. He has lived in Cleveland since 1909. He supervises the watchmen at the Company's power plants and other buildings, supervises their safety men at street openings when the underground department is working under the streets. He investigates reports of current thefts, reports the results of his investigation to the Collection and Claim Department.

2090

(Discussion off the record.)

A. (Continuing) The superintendent of Survey and Record Department is Mr. W. J. Pugh who is 49 years old. He has been 20 years with the Company and has always lived in Cleveland. He supervises the Survey Department in preparing working drawings for line extensions, for construction of overhead and underground lines, rights of way; he gets permits and consents for tree-trimming, etc. He supervises and maintains all circuit maps for all transmission and distribution of lighting circuits.

2091

An Assistant General Manager is Mr. J. T. Kermode. Mr. Kermode is 63 years old. He has been with the Company

2092 *Eben G. Crawford—By Respondents—Direct*

since 1893. He has been Assistant General Manager for three years and previous to that was in charge of the Service Department.

Mr. Kermode has a great familiarity with all of the Company business. He started in as a boy and I think he worked at one time or another in almost every one of the operating departments and he has been for many years in complete

—1,053—

2093 charge of the Company's service. That includes meter reading, service applications, adjustments of meters, charge of meter testing, in charge of the Company's transportation, properties and buildings, garages, warehouses and shops, in charge of the operation of the office building for the Company, a most valuable man in every respect.

Mr. Kermode has under him in the Service Department, the man who succeeded him as head of the Service Department, Mr. Clarence F. Whiteman. He is 51 years old and has been with the Company 35 years, three years in his present job, born and reared in Cleveland.

2094 Mr. Whiteman supervises all work on the customers' premises, the installation and removal of meters, the meter reading department. He maintains and operates the street lighting equipment and all equipment on the consumers' premises.

In charge of our Stores Department as superintendent is Mr. R. P. Snow. He is 47 years old and has been with the Company for 13 years. He has direct supervision of all stores and employees. He supervises both warehouses—we have two warehouses, one on the east side of Cleveland and one on the west side of Cleveland. He is in charge of the

2095

records, stores, materials and supplies, and in charge of requisitions for such stores and materials.

As Fuel Agent and Civil Engineer in charge of Building Construction is Mr. F. C. Loweth. He has been with the Company 19 years and has lived in Cleveland since 1912.

—1,054—

Mr. Loweth buys all the coal that the Company consumes. He has charge of the routing of fuel, tracing of lost freight and making freight claims. He is also a civil engineer in charge of new building construction and alterations. He is in charge of the maintenance of our branch offices throughout the territory. He is our contact with the Federal and Municipal authorities on engineering work in the matter of getting permits for buildings from the Zoning Commission. He has general supervision of the transportation and automobile shops.

2096

The Superintendent of the Automobiles, Garages and Shops is Mr. George H. Skinner. He is 54 years old and has been with the Company for 34 years, three in his present position. He was born and reared in Cleveland. He is in charge of all our automotive equipment, passenger cars, trucks, tractors, trailers, cranes, pole diggers. He is in charge of the garages. He is in charge of the moving of supplies as required between Company properties. He is in charge of our cable reclaiming department, transformer repairs, and tool repairs.

2097

The Purchasing Agent of the Company is Mr. W. H. Hartman. He has been with the Company 35 years, 29 years in his present position. He has lived in Cleveland since 1900. He is in charge of purchasing all supplies and

2098 *Eben G. Crawford—By Respondents—Direct*

equipment and he disposes of obsolete material and scrap for the Company, scrap metals.

The Pay Master is Mr. H. G. Elder, 51 years old and 28 years with the Company, 20 years in his present job. He

—1,055—

has lived in Cleveland since 1912. He is not only Pay Master but he is in charge of personnel, that is the hiring of personnel. He interviews applicants for positions. If a department needs an employee of one type or another they
2099 tell Mr. Elder what the qualifications are of the man or woman that they need and he interviews applicants, selects the ones he thinks might be suitable and sends them to the department head for his final judgment on whether or not they should be employed. He is responsible for the employment and payroll records and Social Security Board reports.

Mr. Browning: Mr. Examiner, could we take a recess at this point?

The Examiner: Yes, we will have a short recess.

(Whereupon, a brief recess was taken.)

2100 The Examiner: You may proceed.

By Mr. Browning:

Q. What has been the Company's record of employee relationships? A. I think it has been about as fine as it could have been. I mean, I think our relationship to the employees and the employees among themselves is about as fine as could ever have been in any company. We never have the slightest disagreement with our employees in any respect. There has never been a union in the Company. The employees have

2101

never suggested that there might be. Personally, I think I am as much interested in employee relationship as I am in

—1,056—

any branch of the Company work. I know—I can't say I know all of them but I know a great many of them personally. I am in constant contact with them.

While we are non-union in our operation, we get along extremely well with the trade unions in Cleveland because all our construction work done by contractors is done by the union labor.

2102

Q. What is your standard work week? A. We have been working 40 hours a week, that is eight hours for five days, ever since 1933 when the N. R. A. became effective. We were working a 44-hour week before that but we found that after getting adjusted to the 40-hour week it was entirely satisfactory in every respect. We pay time and one-half for overtime and our employees have vacations with pay.

Q. Do you interest yourself in safety in the working conditions? A. I think we are strictly active in safety work. We have safety committees in practically all departments of the Company in which there is any degree of hazard. Those committees meet frequently. There is competition among men for the best safety records.

2103

There are in some cases some rather severe penalties for flagrant infraction of safety rules. The safety work has been not only extremely interesting to the men but has had a very satisfactory result. For instance, between 1925 and 1939 accidents resulting in any disablement decreased 81 per cent. I think that in 1939 possibly we had as low a rec-

—1,057—

ord of disabling accidents as any company in the country

2104 *Eben G. Crawford—By Respondents—Direct*

At the beginning of 1940 we had 114 Company drivers who had driven more than ten years without any accidents for which they were responsible. We have been leading up in the Cleveland Safety Council records for fleet operation. We have been right at the top year after year for operating a big fleet without accident to the public.

We maintain a dispensary in our main office building. There every morning from 8:30 for as long as they are required, there are two doctors, both eminent doctors. We
2105 have four trained nurses in that Cleveland Dispensary. We have visiting nurses who visit the employees at home when there is any sickness among the employees. We have one visiting nurse in the eastern district. In 1939 there were 4,500 calls in the dispensary. In 1939 there were 3,900 calls at homes of employees. We use all possible safety appliances both in our shops and in the field.

In line work the employees are given all the precautions that are known to the industry to prevent accidents. In the last three years we have adapted and trained our men in applying resuscitative methods to a man who has been
2106 shocked on a pole before they bring him down.

We did not find this out but it was found by other companies.

Q. Do you remember where you borrowed that idea? A. I think we got that idea from a report in one of the maga-

zines that we saw that started in Pittsburgh and then Milwaukee took it up. I think Milwaukee went into it before we did. We sent men around to various companies where

2107

it was being applied to see whether in their judgment it was worthwhile doing it and we came to the conclusion that it was.

Now they go to work on a man before they lower him to the ground and the theory is that the interval between the time of the shock and getting him down to the ground is a critical one and the record has been, I think, very satisfactory as to bringing men back to consciousness. I am merely saying that because we try to keep abreast of all developments in safety for employees.

2108

(Discussion off the record.)

By Mr. Browning:

Q. Do you support any recreational activities for your employees? A. Yes, we have three welfare associations, the Men's Welfare Association with about 2,300 or 2,400 members, the Women's Welfare Association with about 400 members, and the Illuminators, that is the Colored Welfare Association. They call themselves the Illuminators. I am the president of that organization.

2109

The employees pay nominal dues of $1.00 a year and the Company makes up the difference in the budget. Our contributions for the Men's Welfare Association runs around $1,000, for the Women's Association I would say it ran about $2,000 a year, and for the Illuminators about $700. The Illuminator's cost per head is very much higher than that of

the others. They have a great time. In the Men's Welfare Association we fixed up a room for them in one of our garage buildings. They gather there every Tuesday night. You

2110 will find 300 men playing pinochle and 150 men playing duplicate contract bridge. There will be about 20 Ping Pong tables in operation. That goes all winter long. Then we provide bowling and we have bowling once a week that we rent alleys for.

They have a golf league within the Company and a golf team in the Industrial League and I may say that the Illuminating team won the championship in that Industrial League for 1938-39.

2111 We have Company picnics. I go to the golf—we have two golf matches within the Company for which we put up prizes, one in the spring and one in the fall. Until this last year I have always participated in that tournament and I have noticed that they always put up their best player to give me a beating and he always does it.

Our recreational relations with the employees are a very happy thing. We have this big picnic at the Euclid Beach in July of every year, at which everybody who is not absolutely required to be working attends. The picnic opens about ten in the morning and lasts until the evening. We get 11 or 12

2112 thousand people there for that day.

We make arrangements with the Euclid Beach Park to buy scripts of tickets for the various rides and roller coasters, etc., and give them to children. One of the features of that picnic is a dinner that I give at noon to the men

—1,060—

retired on pension and their wives. It is about the only chance I have to maintain contact with these men who have spent their lives in the Company and are maintained on a pension. At each annual picnic I give a dinner and we get all those old fellows in there with their wives. On that day

2113

also I present to employees who have completed 25 years service, a gold service pin of the Company. They get a great kick out of that.

I used to throw out the first ball at the baseball game but I have given that up. Really that picnic is a very fine thing and we are told that it is the best operated and arranged picnic that comes to Euclid Beach. We go there every year in July.

Q. Have you a pension plan for your employees? A. We have had since 1931 a pension plan funded by the Prudential Life Insurance Company. At the time I was secretary of the Company and before I took over the management, one of the things I did from about 1929 until 1931 was to study pension plans. We felt that we had to put in pensions for our employees and we put a lot of time on it. We employed consultants from Philadelphia who were, I think, the leading experts in pension study and we finally evolved a plan. We submitted that to two insurance companies, the Metropolitan and the Prudential, and after much consultation in New York with the representatives of these companies we finally settled on the Prudential Insurance Company.

2114

2115

That plan provides that any male employee having 20 years service with the Company, reaching the age of 65,

receives an annual pension of 2 per cent. of his total earnings while with the Company, a minimum of $40 a month, a maximum of $6,000 a year.

The same thing applies to women employees who have been 20 years with the Company and have reached the age of 60. An employee must retire at 65 unless by executive

2116 action he is asked to continue and we have had only two exceptions to the rule of employees retiring at pension age. One of those was Mr. Mills, Vice President and Treasurer. The other was Mr. Fred S. Lewis, in charge of the Electrical Department. Those were both men with full strength and vigor when they came to the age of 65 and they felt that they could continue and would like to continue and so they are still working.

On the other hand, in order to protect them against any
2117 possible change in the pension plan I arranged for them to be given their pension from the insurance company as if they had retired and so they have that and then we have made up the difference in their pay on the Company pay roll so that if the plan were abandoned or modified in any way they would not suffer from having stayed on in the employ of the Company.

That plan is non-contributory from the employees. We estimated by actuarial calculations that if the Company would put up $300,000 a year with the insurance company that we would take care of all our current pension liabilities
2118 and amortize our accrued liability, the liability that had been built up before the pension plan was put in effect, in 25

years. We used life tables, mortality tables, and we erred in one direction. We could not actuarially estimate what turnover would be. We took our own Company records on turnover and that of other companies in the industry and arrived at what we thought would be the turnover discount, the men working for us in 1931 that would not stay there until they became of pension age.

2119

Just at that time the depression came on and every man who had a job kept it, so we have had no turnover in the nine years that have elapsed since the plan was put into effect. So as a matter of fact our pension reserve is somewhat in arrears as far as the amortization of the accrued liability is concerned. If we ever get to the place where we are making a little money I think we will put a little more into that reserve. It was the first utility company, I think, that funded its pension plan with insurance companies and that was done early in 1931.

2120

Q. Do you insure the life of your employees? A. Yes, we have insured since 1916 every employee for $1,000 in the Aetna Life Insurance Company, at no cost to the employee. I think that plan could well be modified so that the employee might participate in the cost of it and get a somewhat larger amount of insurance but it has been satisfactory to the employees and we never have changed it. It has been in operation since 1916.

Q. Does the Company maintain a special fund known as

—1,063—

2121

the Employees' Fund? A. It has for a great many years maintained a practice which we have called the Employees' Fund, of giving employees additional pay at the end of each year. For many years that has been on this basis, that all employees making less than $3,780 a year have credited in a savings account five per cent. of their total earnings for that past year. That is accumulated in the hands of three trustees, Mr. C. W. Mills, Mr. H. W. Hough, and myself.

The fund is invested in the bonds of the Company and some of it in preferred stocks of the Company and in some

savings accounts. There is something over $1,000,000 in the fund. As I say, each year the employee has credited to him in his little book like a savings book, five per cent. of his pay during that past year and interest at two per cent. on the accumulated balance. If he stays with the Company for ten years he gets that money in cash at the end of the ten-year period. If he leaves the Company before the 10-year period is up, after giving required notice of his intention to leave, he gets the accumulation in the fund one year after he leaves.
2123 If he is discharged for cause he forfeits anything that may have been credited to his account in the fund. It has been a very happy thing for the employees.

I think we have paid out something like—since 1904 when we started, we have paid out $5,250,000. Last year 253 employees who received their 10-year accumulation got $240,000, or an average of about $950 apiece. That 10-year accumula-

tion coming to them in cases that I know of, has been the initial start on the payment for a lot or payment for a home.
2124 It has bought a great many automobiles and has just worked beautifully both from the standpoint of the employee and the Company.

Q. Do you grant sick leave to your employees? A. Yes, we do. We do it on a schedule. We used to do it only to salaried employees, but in 1935 we extended it to our hour employees as well. The provisions are like this. Any employee who has had more than five years continuous service gets full pay for three months, followed by half-pay for one month for each year of service, with a maximum of 14 months. Employees with more than three but less than five,

2125

get full pay for two months, followed by half-pay for one month for each year of service.

Employees of more than one year but less than three years get full pay for one month, followed by half-pay for one month for each year of service.

Employees with less than 12 months service get two days' full pay for each month of service.

Now, an illness where an employee exhausts the sick leave with pay he is kept on the pay roll as an employee to enable him to maintain his pension and group insurance records. In other words, if he is sick for a longer time than for which we pay him we still keep him on the pay roll as an active employee indefinitely until we learn that he has died or moved

2126

—1,065—

away so that he will not forfeit his pension rights or his group life insurance.

Q. Could you tell us what is the ayerage length of service of your employees? A. The average length of service of supervisory employees, that is employees in positions of responsibility, is in excess of 23 years. Those men have been in the present jobs for an average of more than ten years. Of all employees, 77 per cent. have been in the employ of the Company for five years or more; 64 per cent. for 10 years or more; 13 per cent. for 20 years or more; two per cent. for 30 years or more.

2127

For male employees the average length of employment is 13 years. For women employees the average length of employment is 9.3 years. 13 per cent. of our present employees have been in the service of the Company for 20 years and 27 per cent. of the employees of 20 years ago are still with us.

2128 *Eben G. Crawford—By Respondents—Direct*

Mr. Browning: I should like to have this chart which is entitled, "The Cleveland Electric Illuminating Company Organization Chart", marked for identification as Respondents' Exhibit No. 30 for identification.

The Examiner: All right.

(Organization chart marked Respondents' Exhibit 30 for identification.)

2129 *By Mr. Browning:*

Q. Mr. Crawford, was this chart prepared from the records of the Company? A. It was.

—1,066—

Q. And it correctly sets forth the facts shown there? A. It does.

Mr. Browning: I offer this chart in evidence as Respondents' Exhibit No. 30.

Mr. Binford: No objection.

The Examiner: All right. It is received in evi-
2130 dence under that number.

(Respondents' Exhibit No. 30 for Identification, received in Evidence.)

Mr. Browning: I should like to have marked for identification, a table entitled "The Cleveland Electric Illuminating Company Funded Debt."

The Examiner: All right. Let it be so marked.

(The table described was marked Respondents' Exhibit No. 31 for Identification.)

2131

Mr. Browning: The record might show that this consists of four pages, Mr. Examiner.

The Examiner: Yes.

By Mr. Browning:

Q. Mr. Crawford, was this table, Respondents' Exhibit No. 31, prepared from the books and records of the Company? A. It was.

Q. Does it correctly set forth the facts therein stated? A. It does.

2132

—1,067—

Mr. Browning: I offer this in evidence as Respondents' Exhibit No. 31.

The Examiner: It is admitted in evidence under the number assigned to it, Exhibit No. 31.

(Respondents' Exhibit 31 for Identification, received in Evidence.)

By Mr. Browning:

Q. Mr. Crawford, will you tell us when The Cleveland Electric Illuminating Company was incorporated? A. The 2133
Cleveland Electric Illuminating Company was incorporated as The Cleveland General Electric Company in 1892. Its name was changed in 1893 to The Cleveland Electric Illuminating Company.

Q. It has had a continuous corporate existence therefore since 1892? A. That is correct.

Q. Will you tell us briefly something regarding its predecessor companies? A. There were in Cleveland in 1892 two electric companies, the Brush Electric Light and Power Company, incorporated in 1881, and The Cleveland Electric

Light Company, incorporated in 1884. The Brush Electric Light and Power Company was primarily a street lighting company. Mr. Charles F. Brush had invented the electric arc light and he formed this company primarily to light the streets of Cleveland and to light the stores with arc lights.

—1,068—

In 1884 another group of people in Cleveland acquired the license of the Thompson-Huston patents for incandescent lighting and they started in the business of lighting homes
2135 and stores with incandescent lights.

The Cleveland General Electric Company, later The Illuminating Company, was formed in 1892 to merge these two companies. The charters of the two companies were kept alive for a number of years and were finally allowed to lapse.

Q. Were these two predecessor companies, the Brush Company and The Cleveland Electric Light Company, the two original electric companies in Cleveland? A. Yes, they were the only two in existence at that time.

Q. Now, did you also acquire the assets of another corporation in 1911? A. Yes, that is true. There was organized
2136 in 1907 a company called Cuyahoga Light Company which operated in a very small district down near the public square in Cleveland. It came about through the owner of a building putting in a heating and lighting plant and then extending his services into other adjacent buildings.

In 1911 the property of that company or the company, itself, was acquired by The Cleveland Electric Illuminating Company. The Company was later dissolved.

Q. Has the Company at any time organized subsidiaries which are no longer in existence? A. Yes, the Company has

—1,069—

had three such subsidiaries. The Power Construction Company was organized in 1920 and it acquired the site of The Illuminating Company's Avon generating plant. It acquired property from the Avon Railroad Company which was also organized by the Company. It held and disposed of parcels of land bought for the use of the Company and was used as a real estate company to avoid making it necessary to get releases and make deposits under the Company's mortgage indenture for pieces en transit, as it were.

If we needed half an acre we might have to buy three 2138
acres to get it. The Power Construction Company would buy the three acres, take title to it, transfer the half-acre to the Illuminating Company and then dispose as it could of the surplus property. It was dissolved in 1938 and the assets transferred to the CEICO Company which is a subsidiary still in existence.

The Avon Railroad Company was organized in 1935 with a capital of $255,000. It bought a defunct railway, right of way and the rails, which ran from the site of the Avon plan where there had been formerly a small power plant and an amusement park, and crossed at a right of way across three 2139
main line railroads. The Avon Railroad Company was incorporated to deliver coal to the Avon plant by making contacts with these three roads, the Baltimore & Ohio, the Nickle Plate, and the New York Central. It was dissolved in 1927 and the switching track was conveyed to the Illuminating Company and the other track disposed of. The balance

of the property was transferred to the Power Construction Company.

2140 The Illuminating Securities Company was organized in 1925 with a capital of $50,000. At that time we had marketed about $15,000,000 of 6 per cent. preferred stock. We had done that without underwriting and had sold a great deal of it to about 6,000 stockholders living in our territory.

Many of those holders had never owned any corporate securities at all and were not familiar with brokerage houses or stock exchanges or how to buy and sell, and this company was organized to provide them with a place where they could
2141 add to their holdings of the 6 per cent. preferred stock or dispose of it. It was kept alive until 1937. It provided a market for fractional shares of both common and preferred stock, following a reorganization of the Company's capital structure in 1935. It served a useful purpose we thought up until that time. It was inactive thereafter and was dissolved in 1937.

Q. I believe Mr. Lindseth testified that The Illuminating Company has also acquired by purchase the assets or stock of seven other companies from third parties. Is that correct? A. That is correct.

2142 Q. And those companies were all dissolved following their acquisition? A. That is right.

Q. He has also testified, I believe, that The Illuminating Company today has two subsidiaries, the Power and Light Building Company, and the CEICO Company. A. That is

correct.

Q. It has no other subsidiaries? A. It has no other subsidiaries.

Q. You have told us about the organization of The Illuminating Company in 1892. Will you outline briefly the

history of the Company since that time? A. In 1893 the gross revenues of the Company were $189,000. Of that $189,000, $19,000 became net income. Bond charges were $30,000 and preferred dividends, 15.

Q. Fifteen-what? A. Fifteen thousand dollars.

The Company, even during the first year, earned its fixed stock and dividend requirements and has done so ever since. In 1893, just to show the growth of the Company from 1893 until 1914, which was largely the period of transition from gas or oil to electricity for lighting in the homes—in 1893 2144
the physical property amounted to $600,000 with gross revenues of $189,000. Five years later, in 1898, physical property had grown to $1,851,000, a 200 per cent. increase, and the gross revenues had grown to $336,000, a 77 per cent. increase.

In 1903 the property account had grown to $2,909,000, a 57 per cent. increase, and gross revenues to $854,000, a 154 per cent. increase.

In 1908 the physical property was $6,871,000, an increase of 136 per cent. for the five-year period. The gross revenues,

 2145

$1,643,000, a 92 per cent. increase. In 1914 the physical property was $17,185,000, an increase of 150 per cent. The gross revenues had reached $4,256,000, an increase of 159 per cent.

This great growth in physical property necessitated an almost continuous raising of capital in that period from 1893 to 1914. There were 19 sales of bonds aggregating the principal amount of $11,020,000, five sales of preferred stock aggregating $550,000 par value; 11 sales of common stock aggregating $7,762,700.

2146 *Eben G. Crawford—By Respondents—Direct*

Q. Mr. Crawford, does Respondents' Exhibit 31 show the detail of all the issues and retirements of funded debt, preferred stock and common stock, throughout the Company's history? A. It shows the dates of issue, the amounts of those issues, the price realized by the Company, the date of redemption, if redeemed, and the price at which they were redeemed, of all issues that have ever been issued by the Company since 1893.

Q. Now, will you tell us about the period from 1915 to
2147 1919. A. That was a period of very rapid growth, of course, because it was a period in which the World War fell. Starting in 1914 the physical property was $17,185,000. That grew until in 1919 it was $31,437,000, an increase of 82 per cent.

In 1914 gross revenues were $4,256,000. In 1919 they were $9,550,000, an increase of 121 per cent. During this period all financing was done by the issuance of bonds be-

cause in that period no equity money seemed to be available, so that in that period $11,300,000 principal amount of bonds
2148 were sold

In 1916-17, $3,300,000 principal amount of bonds were sold at a money cost to the Company of five per cent. In 1917 an additional $50,000 principal amount was sold at a cost of 5.2 per cent. A further $25,000 principal amount was sold at a cost of 5.6 per cent.

In 1917 also $1,490,000 principal amount of bonds were sold at a money cost to the Company of 5.4 per cent. $3,935,000 of principal amount of bonds were sold at a cost of 6.2 per cent.

In 1919, $2,500,000 principal amount of bonds were sold, at a money cost to the Company of 5.7 per cent. That makes a total of $11,300,000 principal amount of bonds sold in the period between 1915 and 1919.

Q. What was the result of these issues on coverage of interest charges? A. Well, by increasing the funded debt at that rate, it had to be done at a much faster rate than earnings. The coverage of interest declined from 4.3 times to 2.4 times.

Q. What happened in the post-war depression period? 2150
A. We have called the post-war depression period the years 1920-21. In those two years physical property increased from $31,440,000 in 1919 to $41,200,000 in 1921, an increase of 31 per cent.

—1,074—

The gross revenue increased from $9,390,000 in 1919 to $13,000,000 in 1921, a 39 per cent. increase. With this growth additional capital funds were required and at that period they were exceedingly costly. The Company, in 1920, sold $5,000,000 principal amount of 7 per cent. first mort-
gage collateral bonds, due in 1935, at a money cost of 8.3 2151
per cent. It sold in 1921, $5,000,000 principal amount of 7 per cent. sinking fund gold debenture bonds due in 1941, and callable after 1931, at a cost of 8.1 per cent. It sold $4,000,000 of 6 per cent. preferred stock at a cost of 8.7 per cent in 1920.

Q. Now, will you tell us about the period from 1922 to 1930? A. 1922 was the year in which the North American Company appeared in our picture. They acquired control of our Company by purchasing $10,946,100 par value of our common stock, or a total of 72.7 per cent.

2152 *Eben G. Crawford—By Respondents—Direct*

Q. They have had control of The Cleveland Company ever since? A. Continuously.

Q. Yes. A. I am speaking about the period now from 1922 to 1930. In that eight years of course was the period of greatest growth in our Company. The physical property increased from $41,000,000 in 1921 to $128,000,000 in 1930. Gross revenues increased from $13,000,000 to $26,480,000.

—1,075—

This was partially due to growth within our territory up
2153 until about 1926. Our territory principally comprised Cuyahoga County in which Cleveland is located. From then on we began to expand to the east so that by 1930, the end of this period, the territory had greatly increased in area, although not proportionately in property additions in that territory and revenues derived in that territory, but to provide for this growth and for this extension of territory and the acquisition of the property in this territory into which we extended there was a tremendous amount of capital required.

For instance, 1922 the Company issued $5,281,800 par
2154 value of common stock. It sold at $100 per share. In 1923, 1924 and 1925 the Company sold $15,281,700 of par value of preferred stock that sold at a cost of 6.12.

Q. Per cent.? A. Per cent. That is contrasted with these sales mentioned before at money costs over 8 per cent. just three or four years earlier.

In 1924 the Company issued $1,584,500 par value of common stock that sold at $150 per share. $50 per share of that went into capital surplus.

In 1924, $11,500,000 principal amount of bonds were sold at a cost to the Company of 5.2 per cent.

2155

In 1926, $10,000,000 principal amount of bonds were sold at a cost to the Company of 5.03 per cent.

In 1930, $17,029,800 of stated value of common shares were sold at $20 per share, which was the stated value. That is a total of securities issued in that period of $60,677,800. There were retired within the same period, $4,000,000 par value of 8 per cent. preferred, issued in 1920. That was retired in 1923.

2156

During this period, of course, the Company's financial condition greatly improved. There was a marked shift in the distribution of capital. The debt shifted from 62 per cent. of the total capital to 36 per cent. Preferred stock rose from 11 per cent. of total capital to 12 per cent. and the common from 27 per cent. total capital to 52 per cent. The ratio of debt to physical property decreased from 67 per cent. to 35 per cent.

The coverage of interest charges increased from 2.2 times to 4.4 times.

2157

Q. Did this result in a greater investment per dollar of gross revenue during this period? A. Yes, back in 1922 our ratio of property to revenue was 3.27, and in that period of 8 years it increased to 4.86. In other words, it took $4.80 invested in physical property to produce a dollar of revenue.

Q. Were any earnings left in the business during this period from 1922 to 1930? A. Yes, the dividend payments of the Company during that period were moderate and substantial surplus was accumulated. In 1928, $16,629,000 of surplus was capitalized and frozen in a stated value of com-

2158

mon stock which meant putting back in the business most of the surplus accumulated during that period.

Q. What were the total undistributed earnings during that period? A. They were $27,788,600.

Q. Did your business continue to increase during the period? A. It increased to a very marked degree. The annual sales increased from 500,000,000 kilowatt hours per year to 1,200,000,000 kilowatt hours. The average revenue per kilowatt hour, however, declined from 2.47 cents to 2.07

2159 cents.

Mr. Browning: I have reached a convenient stopping point, Mr. Examiner.

The Examiner: All right. We will recess until two o'clock.

(Whereupon, at 12:30 o'clock the hearing recessed, to reconvene at 2:00 o'clock p.m.)

2160

2161

AFTERNOON SESSION

(Whereupon at 2:00 P.M., August 15, 1940, the hearing resumed.)

EBEN G. CRAWFORD the witness on the stand at the time of recess, resumed the stand and testified further as follows:

Direct Examination (Continued):

The Examiner: We will resume the hearing.

2162

By Mr. Browning:

Q. Will you now describe for us the period from 1931 to 1939? A. Of course that period from 1931 to 1939 covered the period of the great depression and the coming out of it, and the minor depression of the fall of 1937 to 1938, in those figures.

The growth of the business slowed down greatly, but it did continue. The fixed property account increased from 128,000,000 in 1930 to 143,500,000 in 1939—a growth of 11 per cent.

2163

Revenues increased from 26,480,000 in 1930 to 29,630,000 in 1939—an increase of 12 per cent.

Q. Did your rates continue to decline? A. Yes.

Q. And your production increased? A. Yes. The annual

sales increased from a billion two hundred million kilowatt hours in 1930 to a billion six hundred million kilowatt hours in 1939.

The average revenue per kilowatt hour declined from 2.07 cents in 1930 to 1.77 cents in 1939.

Q. Did you refund any of your capital during this period? A. Yes, we had a number of refundings. In 1931 we retired the five million 7 per cent. sinking fund debentures that were issued in 1921. They could not be retired earlier because of the covenants on retirement incurred at the time of issue.

In 1935 we sold 40 million of 3¾ per cent. first-mortgage bonds and retired a like amount, 40 million dollars of five per cent. bonds.

In 1935 also we retired 15,281,700 par value of six per
2165 cent. preferred stock, and issued in its place 4½ per cent. preferred stock, and in 1935 we reclassified certain common shares into $10,217,880 par value of preferred stock.

Q. Did your financial structure continue to improve? A. I would think it improved quite substantially. The ratio of debt in this period to total capitalization declined from 36 per cent. to 34. The ratio of debt to physical property declined from 35 per cent. to 28, and the coverage of interest changes increased from 4.4 times to 5.9 times.

2166 Q. You had a further refunding recently? A. Yes. In July of this year we sold 50 million dollars of 3 per cent. bonds, and retired 40 million dollars of 3¾ per cent. bonds, thereby acquiring ten million dollars of additional funds for plant expansion.

These 3 per cent. bonds were sold on the basis of money cost to the Company of 2.83 per cent., went to the public on the basis of 2.73 per cent.

As far as I know, that is the lowest cost long-term borrowing of an amount of that size by any utility company. We were very fortunate.

Q. Now, will you state what capital securities you have outstanding today? A. We have outstanding as of today 50 million principal amount of first mortgage bonds, 3 per cent. series, due 1970. We have outstanding also $25,498,900.00 of preferred stock, cumulative preferred, and we have outstanding——

Q. (Interposing) That is 4½ per cent.? A. Four and one-half. $4.50 dividend.

We have outstanding common stock, with a stated value of $40,871,520.00, with an earned surplus of $14,888,000.00. 2168
A total capital structure, then, of $131,258,420.00, of which 38 per cent. is represented by debt, 19 per cent. by preferred stock, 31 per cent. by common stock, and 12 per cent. by surplus.

—1,081—

Q. Does your public utility business differ from other businesses in the fact that service must be rendered, Mr. Crawford? A. I think it varies greatly from ordinary industrial and commercial business, in that respect. In the first place, we must give instant service when called upon by consumers, and in the second place, we must be able to 2169
provide in advance the necessary facilities to give that instant service.

Consequently we have to do a lot of long range planning of plant expansion, keeping in mind always having sufficient capacity to meet any demands made upon us with a sufficient reserve capacity to insure the ability to give service, even with important units, unavailable either through accident or through requirements of maintenance.

I don't know any other business that is quite so constituted. We must know, or must estimate, from two to three

2170 years in advance what our demands are going to be, and we must make the provision to be able to meet those demands. We can't give a deferred delivery, such as many businesses can. It is not an infrequent thing to order a machine tool and to say it will be delivered in two months or three months. It is not an uncommon thing for a woman to go into a shoe store for a pair of ~~s~~s, and, if they don't happen to have the style or the size that she wears, they say, "We will get

—1,082—

2171 them for you in two or three weeks." She goes along satisfied with that.

Our customers demand that when they flip a switch, that the lights will go on, or that the range will cook, or that the iron will iron. So I think, in that respect, our business is different in its requirement for long range planning, the long time procurement of the necessary facilities.

It takes a long time to build a power plant. It takes a long time to get a right of way for the extension of a transmission line and to build that line. So that I suppose we are probably very much in advance of most businesses in de-

2172 termining what our program of growth and expansion is to be. We have no control over ourselves.

We can't say, "We don't want the business to get any bigger; it is big enough." We can't say that—making a line extension to a factory—that we are not certain that that factory will be a commercial success and that we simply have to run the line and make the connection. If we didn't want to do it, the Utilities Commission would force us to do it, and that is just one of the risks of our business.

There is another thing requiring advance planning. We never know when something new will be discovered which

will increase the use of electricity. We didn't know in advance, when the radio was discovered—invented—what a tremendous user of electricity that would be.

—1,083—

We didn't know that the refrigerators would go into most homes, when somebody announced an electric refrigerator, and we don't know today what the next thing is that may come tomorrow, that will increase the demands on our facilities.

It is one business that doesn't seem to be within the control of the management, as to how fast it must grow, and how fast capital must be provided to take care of that growth. 2174

Q. You must forecast your demand for some period in advance? A. Yes. We try to forecast our demand from three to five years in advance, but it must necessarily be a good deal of guess.

We have this other situation, too, that, having provided these facilities to meet a period of growth, then, should there come a depression or a falling off in use of our facilities, we have the problem of trying to keep those facilities working and producing, and that is a job of sales promotion in trying to increase the use of facilities already provided in advance for a greater use which has dropped off. 2175

Q. I want to get clear: What is your approximate minimum time in which you can increase your generating capacity? A. Well, that varies, Mr. Browning. There was a time back in the early thirties when the turbine plants of the

—1,084—

manufacturers were practically idle, that you could get deliveries pretty quickly, and the delivery of a turbine possibly in from 12 to 13 months. Well, now, with the freight pick-up

that has come along, and particularly the preparation for preparedness program, or the defense program, the turbine shops of the manufacturers—and there are only three large shops of that character—General Electric, Westinghouse and Allis-Chalmers—they have their schedules pretty well filled up.

For instance, we ordered a turbine—the first turbine in this new plant that we are building. We got a 15 months delivery date on it and in the interim of six or seven months
2177 between that and when we ordered the second turbine, that period had jumped to 18 months, so I would say, in times like this, that you couldn't count on having a new power plant ready for operation in less than two years.

In other words, the second turbine that we are proposing to put into this new plant at East 70th Street will be delivered, if they keep their schedule—if some priority orders don't come between us and the turbine—will be delivered in April of 1942, and be ready for service in the fall of that year.

So that it would be a two-year—it is a two-year opera-
2178 tion to get that turbine built and in service, with the boilers

—1,085—

and the condensers, and all the auxiliary equipment.

Q. So that it comes down to the fact that you not only must accommodate the customer instantly, when the customer requires service, but that you must have guessed two years in advance that the customer would require service? A. Yes. With the strong possibility of guessing it wrong.

Q. In that connection, is the Cleveland load subject to variations with changes in business conditions? A. Yes. It is quite subject to such variations. I think the more indus-

2179

trialized a community is, the more the electrical demand varies up and down with increased prosperity or—up with increased prosperity or down with depression. Consequently, Cleveland, being a highly industrialized city, has not the same stability of load that a city like St. Louis or Milwaukee would have.

On the other hand——

Q. (Interposing) How would it compare with Washington? A. Oh, Washington is a boom town. There is no comparison between Cleveland and Washington. Judging from 2180
the statistics that we see currently from the Washington Company they haven't done so badly in the last eight or nine years.

On the other hand, Detroit, being even more highly industrialized than Cleveland, the swings from high to low

—1,086—

are even greater than they are in Cleveland.

When Detroit was in the heart of the depression their business was off considerably more than ours was. Since recovery has taken place, their upswing has been considerably higher than ours has been. 2181

So that we have—in a word, we have very wide swings up and down, as business conditions change.

Q. What problem confronts you, then, as president of the company, when you get one of these downswings that you have had? A. Well, that is, of course—as president of the Company, that has been my principal problem during the period of my presidency, because I took over the presidency of our company at the very depth of the depression.

I think the biggest job I had, and certainly the one to which I gave a great deal of time, was in sales promotion,

2182 *Eben G. Crawford—By Respondents—Direct*

to try to—we had the plant capacity, we had the distribution and transmission lines, we had a certain territory; that territory would only produce so much business, and I think of it in this way, that it would be like a farm. We have a farm of a certain acreage. We had the barn and we had the tools and the tractors and the plows and all the necessary things to reap and take care of all the business that could be developed, and the grain that could be grown on that farm, and I would think of sales promotion as possibly the

2183 —1,087—

fertilization that we would put into that farm to try and get more crops out of it, so that in the time—at the time I took over the management of the Company, we redoubled our sales activities, our sales promotional activities, and we did everything that we could think of to get these facilities, which had been bought at the time when the load was high, to get them back to work.

I think we fertilized the land as strongly as we could and I think we are getting pretty good crops from it now, but it has taken a great deal of my thought—I would think pos-

2184 sibly more than any one thing except financing.

Q. Has your demand for capital been constant? A. Well, the demand has been continuous, but it is not constant in the sense that we may require about the same amount of new capital each year.

For instance, as I stated a little while ago, we had what proved to be an excess of generating capacity when the depression set in, and consequently the demand for capital investment, until we again brought consumption up toward the safe capacity of those existing plants, was not great.

2185

In 1939, however, when we were faced with the prospect of building a new plant, our construction budget jumped, and in 1940 the continuation of that new plant construction, together with the projected construction in '42, will mean that our construction budget in '41 will be on the order of

—1,088—

ten million dollars per year, so that I would say that there was a continual demand for increased investment, but we don't get the necessary money to make that investment year by year. For instance, in—I have some figures here—from 2186
1931 to 1939 the average construction expenditures—by that I mean net expenditures; construction less retirements—amounted to less than 2½ million dollars a year.

In 1924 and 1926, and from 1928 to '30, they exceeded nine million dollars a year. In 1926 and 1930, each of those two years, the production budget was 16 million dollars. Now, those two years involved the building of the large power plant, one at Avon in 1925 and 1926 and one at Ashtabula in 1929 and 1930.

Since then, until we put in this new—started this new plant last year, there have been no unusually large construc- 2187
tion programs, except adding a turbine at one of the other plants.

That can be done with the plant built and all the facilities—the machine facilities in—can be done by spending very much less money per unit than is required when we start a new plant.

Q. Did you point out that the ratio of physical property to gross revenues and net income has been increasing? A. I pointed out at certain points, but I have here figures that

indicated that in 1919 the ratio of physical property to gross

—1,089—

revenue was 3.35 and in 1939 the ratio of physical property to gross revenue had jumped to 4.84.

Q. What about the ratio of physical property to net income before interest? A. That has increased since 1919 by 14 per cent.

Q. Would it be possible, Mr. Crawford, for you to provide for your needed plant expansion out of your own earnings,
2189 such as I understand is possible with many industrial concerns? A. You mean that, if we were to forego dividends, would we have sufficient earnings to take care of plant expansion?

Q. Yes. A. Well, it wouldn't be true with our Company.

Q. Could you give us an example? A. Well, now—yes, I presume that into the Ford Motor Company has gone very little new capital than that provided by the business itself. In other words, after the first small initial investments, I am under the impression that that plant has grown to its present size by merely plowing back earnings.

2190 That just wouldn't work, couldn't be done in our Company; in the first place, with the regulated rates, we wouldn't have sufficient earnings. As an example that you have asked for, in the period of from 1922 to 1930 our plant investment

—1,090—

increased $87,400,000.00. Of that $87,400.00, $12,800,000.00 was provided by investment of depreciation reserves, leaving a balance required of $74,600.000.00.

Now, if all common dividends had been foregone——

Q. (Interposing) Dividends or earnings? A. Well, if dividends had not been paid and all earnings available for

common had been applied to capital they would have amounted in that period to $47,600,000.00, which means that, even had no dividends been paid on the common, and every cent available for such dividends had been reinvested in the business, there still would have been lacking 27 million dollars.

Q. How does your turnover of money compare with other business—for example, with department stores? A. Well, as I just pointed out, our turnover is at the rate of about a fifth of our invested capital. 2192

Mr. Binford: That turnover is annual?

(Discussion off the record.)

By Mr. Browning:

Q. You mean by "turnover" the annual turnover? A. Well, as has been pointed out, we turn over our capital about once every five years. I think, for instance, department stores turn over their capital many times in one year—from 6 to 8 times in one year. News stands turn their capital

 2193

over almost every day.

I think we are the slowest business in turnover that I know. In other words, we have to invest more dollars to get a dollar of revenue than any business I know of, and that has been increasing, of course, since—in the last twenty years.

Q. I believe you stated that the North American Company's acquisition of control of the Cleveland Company occurred in 1922 and you have pointed out also the earnings

2194 that have remained in the business since that time, the improvement in your debt ratio, and your refundings.

Have you charged off any intangibles since 1922? A. We have made many charge-offs. We have charged off practically all intangibles other than a small amount of interest during construction. If you would like it in any detail, I can give it to you.

In 1927 we charged off $427,000.00, which was the cost of selling the 15 million dollars preferred stock back in 1923,
2195 which had been deferred on the books. We charged off the royalties, franchise and licenses that had been in the assets of the Company until way back in the Edison days, $673,000.00.

We charged off other intangible property, plants, at formation of the Company in 1892, total $608,000.00. We

charged off miscellaneous intangibles assets of $224,000.00. We charged off the securities of the Avon Railway Company, $200,000.00, and we charged off advances made to another subsidiary, the Power Construction Company, for $550,-
2196 000.00. In 1935 we charged off practically all miscellaneous items that were left, leaving only federal and state taxes on securities now outstanding, a total of $37,461.00.

So that our books represent property charged way down with never a write-up. There has never been an asset written up on the books of the Illuminating Company.

Q. Has the Cleveland Company received any assistance in its financing from the North American Company and its staff? A. Well, I think it may have received a tremendous amount of such assistance. We have been required to finance large amounts and we have been required to do it time and

time again, and to be an expert in public utility financing requires not only special training but constant use of that training.

A financial expert must have a continuous acquaintance with financial markets. Not only must he know prices existing on securities as of today, but he has got to know details of the types of securities, their different, individual features. He must know the price trends existing and he must know the type of—he must keep in touch with the type of securities

—1,093— 2198

which will bring the best market, which investors and dealers will buy, and that requires years of training, and it is a field in which there aren't very many men well qualified. He must also know—someone must know, in providing the financing for a Company, the proper provisions and covenants and restrictions and what not that go into corporate mortgages.

There is a good deal of difference of opinion at all times, I think, as to what should go in a mortgage, both from the standpoint of the borrower and the standpoint of people who are supposed to lend the money under that mortgage. 2199

Such mortgages change. For instance, our present mortgage is a totally different instrument than the one that we financed in the earlier years of the Company. The restrictions are different; provisions are different; the covenants are different, and someone has got to keep in constant touch with the development of utility financing.

Then, again, it might be said that you can look to investment dealers for sufficient advice. We haven't found that to be true. The investment dealer——

2200 Q. (Interposing) You mean by that the investment banker? A. Yes, the investment banker to whom we might sell securities.

—1,093-A—

I was in the investment banking business myself at one time and I think it is perfectly true that the investment banker is like any other merchant. He wants to buy the kind of merchandise or stock that he thinks he can sell, and he wants to buy it at a price at which he thinks he can sell
2201 it and make the necessary profit or the desired profit. So we felt that we couldn't rely on the advice of any investment banker as to covenants, call prices, sinking fund provisions, or even prices and spreads—they have always been a matter of argument and discussion.

Q. On the technical side, is there a fundamental difference in approach between the investment banker and a company executive? A. Why, yes. As I tried to point out, the investment banker wants to impose as many restrictions as he can on the borrower for the protection of the lender.

On the other hand, the borrower, seeing an increasing
2202 requirement for capital funds, works in his negotiations with bankers for freedom of action—something that won't cripple him the next time he needs to provide capital.

Those things, when you have time to discuss these things —and you usually must take time—sometimes it would take a long time ironing out the point of view of a banker or group of bankers with that of the borrower.

Q. The security ultimately issued, then, is a compromise

—1,094—

between the two points of view? A. It is bound to be a

compromise. Of course, it depends on market conditions somewhat. In a so-called buyers market the restrictions can be pretty severe. When a Company has to have money, when money isn't available or easy to get for that particular class, then the bankers can tighten up pretty strong on you, as they did on us around 1920. On the other hand, when there is a great deal of money for investment the borrower can, I think, with more success, endeavor to ease the restrictions which will give him more freedom without impairing the security.

Q. Is this conflict, which you are describing, a matter 2204
of lawyers' argument? A. No, I don't think it is. I think it is a matter of business judgment and discretion, rather than legal details.

Q. What about the paper work done in connection with these security issues? A. Of course that is perfectly tremendous, particularly since the Securities Exchange Act was enacted and the Public Utility Holding Company Act was enacted.

Q. There was some before then, wasn't there? A. Oh, there was always a good deal, but it has been multiplied in 2205
the last few years, and it takes a lot of time and a lot of work by a lot of people.

—1,095—

For instance, in this last financing that we were required to do, there were prepared a total of 98 documents covering one thousand five hundred fifty-seven pages. Then again time is a very important element. The Company wants money and it must be certain how to get it. Bankers are not willing—nor should they, I think, especially in times of stress—to carry long time commitments, and the result of

2206 *Eben G. Crawford—By Respondents—Direct*

that is there must be a pile of work condensed into the shortest possible time.

The work must be organized and finished within a rigid time schedule. Now, ever since The North American Company took control of the Cleveland Company—and that was about the time that our demands for capital became really great and pressing in that expansion period of the twenties—we have leaned on North American to do many of these things.

2207 We haven't kept on our staff a fiscal expert. The treasurer of our Company—as I pointed out in my testimony on the organization—has one assistant in treasury matters. To have had such a man as treasurer of the company would have meant charges, and the development of utility financing would have been a heavy expense to the Company.

Whether we could have even gotten one or not, I question, and if we had gotten him, whether he could, with the limited experience that he would have had in our company, the intervals between financing, if he could have kept abreast

—1,096—

2208 of the developments, I doubt very much.

All this time, since I came with the Company in '21, and since the North American assumed control in 1922, we have looked to Mr. Fogarty for that kind of assistance. He at that time was secretary of The North American Company, and I was secretary of The Cleveland Electric Illuminating Company, and he and I together—with he doing most of the thinking on it—kept abreast of markets, banking, prices, the developments in indentures and what not, and of course he had a very wide experience, because while we would only finance this year and then possibly three years later, and

then again five years later, one or more of the constituent companies of The North American Company was doing financing nearly all the time, so that Mr. Fogarty was constantly abreast of financing requirements, and I think his help to us not only saved us a lot of money in having to provide a staff to do that sort of work, but I think his knowledge and experience and constant acquaintanceship with what was going on, served us in better stead than any man we could have hired to do it; even if we had hired Mr. Fogarty himself and put him out in Cleveland, he wouldn't 2210
have been as valuable to us, he couldn't have been as valuable to us as he was getting this constant contact and experience with banking markets year in and year out.

Q. That is, you could not give him the practice? A. No.

—1,097—

He wouldn't have the experience or the contacts out in Cleveland. He has been in constant contact, not only with bankers but with big institutional buyers, and I think his whole work has been invaluable to us.

Q. Have you on your Cleveland staff an expert on the technical terms and provisions of corporate mortgages, and 2211
that sort of thing? A. No. And by the same token I don't think we could have had such a man. In thirty years we have only written two mortgages, and we just haven't felt that we required such a man or such a staff, knowing that we had at our right hand all the time the staff of The North American Company, not only Mr. Fogarty, but, as he was —he was secretary for the Company for many years, then he became vice president of it, and then he was succeeded as secretary by Mr. Piske,——

2212 Q. P-i-s-k-e? A. P-i-s-k-e. —who had trained with Mr. Fogarty, had been his assistant all the time Fogarty was working on The North American financing and then when Mr. Fogarty was made president of North American in '34——

Q. (Interposing) '33? A. No. I think—was it in '33?

Mr. Browning: Off the record.

(Discussion off the record.)

2213 A. (Continuing) Well, then, Mr. Piske became vice president —1,098— of the Company and Mr. Hartel, who had trained for years under Mr. Piske, took over the secretarial and financial details.

Mr. Hartel is now secretary of The North American Company. I don't think we could have mentioned in dollars the value that that help has been to the Illuminating Company in raising funds, and not only raising the funds but raising them in the right way, and at the right rates, and with indentures that are not too onerous, and that kept our financial
2214 structure in proper balance at all times—I just can't say too much about the help that I think we have gotten from the North American Company, particularly in those three men—Mr. Fogarty for a long time, then Mr. Fogarty and Mr. Piske, and then Mr. Fogarty and Mr. Piske and Mr. Hartel.

Q. Now, can you mention specific illustrations? A. Yes. We had, as I pointed out either in testimony or in one of these exhibits, we had an outstanding $800,000.00 of six per cent. preferred stock which had preemptive rights, and which

2215

was non-callable. In 1923 we wanted to raise money by the sale of preferred stock, and we knew that we would have to have money from time to time, and we figured that a part of the capital retirements from time to time, as the Company grew, should be preferred stock. The Ohio law at that time didn't authorize serial preferred stock, but I had many consultations with Mr. Fogarty, both in New York and Cleve-

—1,099—

land, on how we could do this job, and I may say that the solution of it, that the stock as it was authorized and as the 2216
amendments to the articles permitted, did enable us to, without having serial preferred stock, to keep selling from this issue as we did.

Then again in '24, we needed—in 1924 we came to a place where we could see large capital requirements. We had a mortgage written in 1939——

Q. 1939? A. 1909. (continuing)—limited to 30 million dollars, limited to one coupon rate and with burdensome call provisions. As I say, the limit of bonds to be issued under that mortgage was 30 million dollars, and we already had outstanding 18 million, five hundred thousand, so that 2217
there were only 11½ millions available under that mortgage.

It would have been burdensome to call those 18½ million first mortgage Fives. It was a question whether the market would have provided enough money at a proper price to retire them and give us the money we needed for expansion.

It was somewhat of a problem. We had to build a plant at Avon, which was going to take some 15 million dollars. There was much discussion as to how that was to be done. It was even possible it might be necessary to form a separate

corporation to build and own that plant and lease it to the

—1,100—

Illuminating Company.

Mr. Fogarty, however, worked out a new general mortgage which solved our problem. In the first place, it was open end. It had no limitation as to the amount of bond that could be issued thereunder. It was much more liberal in its provisions and in order to raise 11½ million dollars, which we felt that we needed at that time, we took down the
2219 unissued 11½ million of first Fives of 1909 and placed them as collateral, together with a second lien on all the assets of the Company, and issued thereunder 11½ million of general mortgage Fives, and got the new mortgage executed and in operation.

That idea was entirely Mr. Fogarty's.

Q. Was that a new idea? A. It was entirely a new idea, as far as I know. I never heard of it being done before. To show the advantage of it, we were able two years later to issue another series. The first bonds we issued under that
a mortgage were Fives due in '54. That was in '24, and in
2220 1926 we issued ten million more of another series Fives due in 1961. I think we got a little premium for those bonds.

Q. Now, you say that he planned these operations? A. I would say that he not only planned them, but that he actually designed them.

Q. Did he also negotiate with bankers? A. He negoti-

—1,101—

ated with the bankers—he fought with the bankers on the details of the bonds. He negotiated with the bankers, I would say, right down to the final determination of the amount of spread, and the price of issue, and then Mr. Lind-

2221

say and I would go down and work out that last final detail with Mr. Fogarty. He was always with us.

Mr. Browning: Off the record.

(Discussion off the record.)

By Mr. Browning:

Q. Now, what about the recapitalization of 1929? A. You see, we had this 15 million odd of preferred stock issued in '23, '24, and '25, outstanding, and it was always slightly under a cloud from the fact that there was another issue ahead of it, of an uncallable preferred stock that was issued back in 1892 and 1897, so the stock couldn't be called the first preferred stock of The Cleveland Electric Illuminating Company.

2222

It was the six per cent. preferred stock authorized in 1923. We were very anxious to find a way to dispose and eliminate that old $800,000.00. It didn't amount to much in money, but it did throw a cloud upon our other securities and we worked out a plan, for which I think it is only proper to say that Mr. Fogarty is largely responsible, of exchanging that stock for common, and that was done in 1929. The stock was retired, every share of it was converted by the holders

2223

into common shares, with the result that the six per cent. preferred stock, authorized in 1923, automatically became a first preferred stock, and I think our financial structure was certainly benefited by the change. It brought us down into having only three securities—mortgage debt, one issue of preferred stock, and common stock.

2224

Q. Did Mr. Fogarty work out a proposed refunding in 1933? A. In 1933 Mr. Fogarty, in consultation with me, went quite a long way toward refunding our Fives by placing a lower coupon rate bond directly with the insurance companies. He carried on negotiations with them and consultations with me for a number of months. It hadn't been done yet, but he thought it might be done.

Q. That is, it was a new idea then? A. It was new as far as any of us knew about. It was new to me, and I think

2225

new to everybody. I don't think there had been any private placements of anything like the size of that, with insurance companies.

Mr. Browning: Off the record.

(Discussion off the record.)

A. (Continuing) They got into some very hard trading and after pretty continued negotiations the matter was dropped just before we recommended that, in view of the restrictions, that the insurance companies were trying to place on the

—1,103—

2226

mortgage, that we had better not do it, but there was a lot of work done on it and a lot of thinking, particularly by him.

Q. During that period, were you in communication with Mr. Fogarty? A. Well, I have always been in constant communication with Mr. Fogarty, and at that period, when those negotiations were going on, we were just in constant communication, either by my going to New York, or by telephone, or by letter.

Q. What about your 1935 bond financing? A. Well, as you know we had 40 million dollars of five per cent. bonds

outstanding, under the general mortgage which became a—automatically became a first mortgage with its retirement.

Q. With what? A. With the retirement of the collateral, which was effected by the retirement of this 1935 financing. Five per cent. seemed like pretty cheap money back twenty years ago, but it looked a little dear in 1935, so Mr. Fogarty and I watched the market, checked the market, when we were able to retire all of those first mortgage bonds, and general mortgage bonds, and bring out an issue of 3¾ under a new mortgage. 2228

—1,104—

Q. Was that a difficult operation at the time? A. Well, I think it was difficult at the time. I think it required a lot of work. I know that Fogarty and I worked continuously on it for a considerable period of time before we succeeded in doing it. The deal went over very well. We received a hundred and a half for the bond which was a very favorable price at that time. Mr. Fogarty handled all necessary negotiations with the bankers except getting down to the final trading for a half point when I stepped in and reinforced him somewhat. That was a very much better mortgage than 2229 the mortgage we had. It gave us, among other things—we were in a better period to do financing than we had been before. They learned how to write better mortgages, I think, and a so much more liberal mortgage and a very satisfactory piece of financing.

Then again in 1935 we made a reorganization of the stock of the company and sold four and a half per cent. preferred stock to retire the outstanding six per cent. stock, reducing our preferred stock dividend charges. That was done, of

2230 course—Mr. Fogarty and I were working constantly on all these things.

Q. This was a clear-cut serial preferred stock? A. Clear-cut serial preferred stock.

Q. Had Mr. Fogarty had experience with that in other dealings? A. Yes, he had had—He had done that in other

—1,105—

North American Companies, certainly in Union Electric of Missouri, and I don't know but possibly other ones, but he
2231 had had experience with that type of preferred stock.

Q. Now, let's take the most recent illustration, your 1940 financing. Will you tell us about that as an example? A. Well, of course we had had these forty millions of three and three-quarters which were listed on the New York Stock Exchange, had been selling substantially above their call prices, other companies were doing refunding. We were very anxious to refund these bonds. Unfortunately, however, back in the fall of '38 we got into a very extended rate controversy with the city council of the city of Cleveland. The
2232 rates that we would be able to charge in the future were uncertain and we felt that we would have been greatly penalized to have tried to bring out a bond issue and get the money rate that we ought to get until we had that rate controversy settled.

Of course we were hopeful all the time that we might be able to bring about a settlement, but the controversy got more extended and more bitter and finally the council passed an ordinance which we felt was unfair and unreasonable and we couldn't accept, and we appealed to the Public Utilities Commission and the controversy had a good deal of publicity,

and we felt certainly that until that matter was settled, it

—1,106—

wouldn't be possible to refund our old bonds and get some new money which we could see that we needed, at the best possible price.

I was very busy in this rate case. I had charge, of course, of the necessary negotiations with the council on behalf of the company. We had to employ engineers to make engineering studies and to supervise an inventory and appraisal, and the thing went on and on and on. Then, too, we were engaged 2234
in the designing of this new plant. That took a good deal of my time and consideration.

Q. Had the war disturbed you? A. The war overhanging us, which we didn't know but would break the market almost any minute. So, as a matter of fact, the possibility of refunding and refinancing just seemed out of the question. We got the rate matter settled early in June.

Q. 1940? A. Of this year, or possibly the last week in May. By compromise, the City Council passed an ordinance establishing rates for four years which we accepted. It was a compromise offer in our part which they accepted. Con- 2235
sequently, the litigation was settled and the case withdrawn.

I had not thought about any new financing and Mr. Fogarty called me up along the latter part of June.

Q. Will you give us the exact date on that. I think

—1,107—

it is interesting. A. Well, it was on the morning of June 19 that Mr. Fogarty called me and he said that if we could get the necessary papers filed before the end of June, we could do the refunding necessary to retire the three and three quarters and provide us with ten million dollars of new money

without incurring the time and the expense and the delay of a new audit, that 1939 closing figures could be used as the basis for registration statements and other required documents. He said he had consulted with bankers and counsel in North American and felt that it could be done within that length of time and it did not seem to me possible. He thought —Mr. Fogarty thought that by working day and night—which was done—and by adapting, by making some changes that could be made in the existing mortgage that this could
2237 be done. Of course I gave the word to go ahead because there was nothing that I wanted any more than to get those three and three-quarters paid off, and some lower rate bonds, and then I wanted ten million dollars of new money to provide this plant expansion. I don't know how they did it but that outfit down on 60 Broadway, The North American Company, together with counsel, did, I think, a super-human job and it just couldn't have been done by us, ourselves.

At any rate, it was done and we got filed down here in the S. E. C. in time to make an offering on Friday, July 19—

—1,108—

2238 we just worked like thunder to get that off on Friday the 19th because we were afraid to let it go over the next week on account of this possibility of an invasion of England or something that would break the market.

Well, we were very fortunate. We got a good price for the bonds. We got ten million dollars for plant expansion, and we were all very happy about it.

Q. Will the Cleveland Company have financing problems in the future? A. I should think that is almost certain. As you know and has been testified here, our investments grew from thirty-two million property account in 1920 to one hun-

dred and twenty million dollars in 1930. That required an average investment of $8,800,000 a year. We found ourselves, of course, when the depression started, with more plant than we needed and, as I have testified, our problem was not so much to build more plant as it was to keep the plant we had busy.

In 1939, however, our business was back at a record-breaking volume. We sold more kilowatt hours than we ever sold before. And then, of course, preparation for demands that might be put upon us for war preparation has required 2240
us to make a very heavy plant investment. Our business is increasing very rapidly, and of course for every million dollars of increased revenue we must find five million dollars of capital to take care of it.

—1,109—

If our growth in the next five years would require an increased plant capacity of 100,000 kilowatt hours, it would mean an investment of 10 million dollars in generating facilities alone, assuming that generating facilities can be built for a hundred dollars per kilowatt.

Of course, for every dollar we invest in generating plants 2241
we have to invest from two to three dollars in transmission, distribution and utilization, so that we are going to have, if business continues to grow, a requirement of a lot of money every year for plant expansion.

I don't mean that we'll get the money every year but we will be spending large amounts for plant expansion every year, and our budget for 1940 is about ten million dollars. Our budget for '41, while it is not completed yet, will run at least that much and possibly a trifle more. We don't know what the industrial growth of our section will be. We

are optimistic about it. We have room for industrial development and it doesn't seem to me that it is unlikely that our plant investment will grow at the rate of ten million dollars a year in the next ten years.

What we call the Eastern Division, which I think Mr. Lindseth described, that territory lying to the east of the Chagrin River and which is operated separately in many respects from the Cleveland Division, was acquired with the thought that it was an excellent area for future industrial

2243 —1,110—

development.

It has the same freight rates that Cleveland has; it has the same or practically the same railroad transportation; it has access to harbors for lake transportation. The Cleveland—the city area for heavy industrial use is pretty well taken up. Taxes out to the east are very much lower than they are in the city and, as a matter of fact we look for—the trend of industrial development has been to the east from Cleveland, and we look forward to a very active industrial development, in what we call the eastern division. As a mat-

2244 ter of fact, we are already in contact with three large prospective power users to be located in that district. Each one of these will use from 20 to 35 thousand kilowatts, if we are successful in getting them, and it will mean that a very substantial plant expansion will be required.

Of course, as has been stated, we must estimate in advance any demands that we are to be able to take care of. A factory using a large amount of power may be built in 6 months, but we can't provide power for them in six months. It may take us a year and a half to two years to do it.

So we must keep ahead of any possible demand, and we must provide the funds to do that, and then, of the many millions of new capital that will be required if this expansion as hoped for does take place, a large proportion of it must come from equity capital.

—1,111—

Since 1930 there has been little or no equity capital raised in the utility business; it has all been done by borrowing.

We have always managed, we think, to keep our financial 2246
structure in good balance, and if we continue to do that, as we must, it means that junior capital has got to go into this company.

Q. Don't you think it is a little better than good balance, Mr. Crawford? A. What?

Q. Are you proud of it? A. I prefer to have someone else say that. We are very proud of it, off the record. The North American Company has put into the Illuminating Company in the last 20 years over 4[illegible] million dollars of equity capital. In the next 20 years somebody must provide, I think, an even 2247
greater amount. The North American Company, with its investment already made in Cleveland, with its knowledge of the management, with its satisfactory experience over a long time in that Company, seems to me is the logical source for us to look for this equity capital.

I have testified also to the help and assistance that has been given us by the executives of the North American Company.

If we were to be deprived of this help, we would certainly

—1,112—

be put to great expense. We would have to hire people that we do not now hire, and I question, as I said before, whether we could hire and retain the expert advice and help and assistance we have had from the executives of The North American Company.

I feel certain that, if we were dissociated from The North American Company, that the result would be substantially increased financing costs.

Q. Mr. Crawford, do you consider it possible to secure
2249 the necessary capital for the Cleveland Company in Cleveland? A. I think that would be entirely out of the question. I don't think there is sufficient—nor has there been sufficient investment capital in Cleveland to have provided the equity capital that we required in the past.

I don't know of any issue—certainly no utility issue—that has ever been issued in Ohio—take not only Cleveland but Ohio—that required the amount of cash that had to be put into this Company by somebody as equity capital.

As a matter of fact, I question very much whether, even if the money were available, Cleveland investors would have
2250 put up the money we have needed in the past, or that we will need in the future.

They are too close to the situation. They know we have—they are fully aware, from time to time, that we have municipal competition. The newspapers keep them advised of that quite frequently. I just feel certain that Cleveland

couldn't have provided the capital required to take care of the growth of this property and——

Q. (Interposing) What about this theory that has been advanced of local patriotism? Have you found any local

2251

patriotism in Cleveland? A. No, sir, I never saw very many patriotic dollars any place. They are not at all sentimental, dollars aren't, and well, as a matter of fact, in this 50 million dollar bond issue that we have just sold, I used all the influence I could bring to bear to get the Cleveland dealers as large a participation in that 50 million as I could, or as they wanted, and they were very happy and well satisfied when we got them 2½ million dollars out of the fifty.

Q. Was all that placed in Cleveland? A. No, that was placed in the territory served by Cleveland bond dealers and investment bankers.

2252

Q. So that not even all of the 2½ million dollars was placed in Cleveland? A. No. Cleveland, as you know, was pretty hard hit back in the early thirties, not only by failures of railroad financiers, but also with two very severe bank failures; two of the three largest banks closed up and Cleveland funds have been scarce for any kind of investment since that time, and then particularly, I think, Cleveland local capital has been interested more in industrials, steel

—1,114—

2253

business and motor car business, and lake transportation, iron ore, coal, and that sort of thing, than in any other type of investment, so that I can state without qualification that Cleveland could not have financed the growth of this Company.

Q. You mean that the Cleveland investor would be more interested in industrials with larger profit possibilities? A. More speculative, more chance of making money. That is just the kind of town Cleveland is.

The Examiner: Let us have a short recess.

(Whereupon a short recess was taken.)

—1,115—

2254 *Eben G. Crawford—By Respondents—Direct*

By Mr. Browning:

Q. Have investors been unable to obtain the information necessary to appraise the financial position or earning power of The Cleveland Company because of the absence of uniform standard accounts? A. No. Since 1911 this Company has continuously used the Uniform Classification of Accounts of the Public Utilities Commission of Ohio. The Public Utilities Commission annual reports are available for public inspection. We have published annual reports to stockholders
2255 every year since 1918. We make quarterly reports to financial publications and financial services such as Moody's and Poor's Standard Statistics, Wall Street Journal and Standard Stock Exchange.

We make reports frequently to the Federal Power Commission, voluntary reports, and to the S. E. C., and the Public Utilities Commission Classification of Accounts is the basis for all these reports.

Q. Are your securities issued without the approval or consent of a governmental body of the State of Ohio? A. All of our securities are subject to the consent by the Pub-
2256 lic Utilities Commission. It requires written application on our part, a public hearing by them, and an order signed by the Commission.

Q. Has The Cleveland Company issued securities upon the basis of fictitious or unsound asset values having no fair relation to the sums invested in or the earning capacity of

the properties? A. Well, there have been no such security issues. There have been no paper profits in inter-company transactions and very few inter-company transactions of any

kind, and such transactions have always been at cost. Hence, no such securities have been issued on either such basis.

Q. Have you issued any securities under circumstances which have subjected you to the burden of supporting an over-capitalized structure and which have prevented you from making voluntary rate reductions? A. I think quite the reverse is true. Our total capitalization is only 83 per cent. of our $145,000,000 property value. Interest charges are 3 per cent. on $50,000,000 of bonds and 4.5 per cent. dividends on $25,500,000 of preferred stock. 2258

There have been no loans made either to the North American Company or no borrowings from the North American Company. We made seven voluntary rate reductions in the past 16 years. The average revenue per kilowatt hour residential has declined from 5.06 cents in 1924 to 3.58 cents in 1939, and a very substantial rate reduction was just made effective in 1940 which will still further reduce that revenue.

Q. Do you know whether there has been any lack of economy in the raising of capital in the Cleveland Company? A. There has been no such lack of economy.

—1,117— 2259

Q. Mr. Crawford, where is the final authority in the management of the Cleveland Company? A. The final authority of management in the Cleveland Company is in the board of directors.

Q. Is there an executive committee? A. Yes, there is an executive committee of three members of the board. The board has seven members. The executive committee is composed of three of those seven members and has consisted since I have been president of the Company, of Mr. Fogarty, Mr.

2260 H. C. Freeman, a director and vice president of North American Company, and myself.

Q. What are the functions and duties of the board of directors? A. Well, the board of directors, I think, does what most such boards usually do; specifically it elects the officers of the company, fixes the compensation, selects the executive committee, declares dividends, approves construction and operating budgets, authorizes financing and the issue of securities, authorizes the president to act in matters
2261 such as rate reductions. It authorizes payments to the trustees of the Employees' Fund. It acts on all formal matters.

Q. And it is generally in charge of the management of the business? A. Very actively so.

Q. What has been the composition of your board of directors? A. Well, for more than 20 years we have had, out of a

board of seven, three members resident in Cleveland, a fourth one in Cincinnati, and three outside the state. For more than 30 years at least two representatives of the Company's staff on the board have been resident in Cleveland. At the
2262 present those two would be Mr. Frank Cobb, and myself.

For the same 30 years one representative has been a resident in Cleveland whose interests are not specifically utilities. That particular representative is Harold T. Clark. Such an arrangement on a board of seven makes for a desirable balance between representatives of the local management and the local community, the controlling stock ownership, the minority ownership, and generally broad business viewpoints.

Q. You say that there are seven directors of the Company? A. Yes.

Q. Of whom you are one? A. Of whom I am one.

Q. Will you tell us who the other six directors are? A. Frank M. Cobb, who is our general counsel, a lifelong resident of Cleveland, has been a director practically all the time for the last 28 years. He has been associated with the Company since 1902 and has been full-time office counsel since 1914. He was made general counsel of the Company in 1924. Mr. Cobb is certainly one of the best informed lawyers in Ohio on public utility law. He has practiced before the Commission for our Company since the Commission was formed 2264

—1,119—

in 1911, and he was a member of the faculty of Western Reserve Law School for many years. He is a man of means and substance in the community and very highly regarded.

Harold T. Clark, who has been a director with the exception of a very short interval since 1922, was for many years a senior partner in the firm of Squire, Sanders and Dempsey. This firm is one of the leading law firms in Ohio. However, in 1938 Mr. Clark retired from Squire, Sanders and Dempsey and opened his own office. He has remained on our board, of course. He is a very important man in civic affairs 2265 in Cleveland. He is a man of means and has taken large interest in public affairs.

He is president of the Cleveland Museum of Natural History. He is a member of the Regional Association of Cleveland. He is very active in the Cleveland Association for the Blind, and the Cleveland Museum of Art, the Western Reserve Historical Society, and many other civic affairs.

William H. Fillmore. Mr. Fillmore has been a member of our board since 1913 and lives in Cincinnati. He is an investment banker in Cincinnati and has represented, I would

2266 *Eben G. Crawford—By Respondents—Direct*

say, the minority interest in the voting stock all that time. He is a very cooperative director. He is very constant in his attendance. I don't think—I can't remember his ever being absent from a meeting of the board since I have been associated with the Company, and he corresponds with me continually and frequently about the affairs of the Company. He

—1,120—

has been an excellent director.

Another member is James F. Fogarty, chairman of the
2267 Finance and Executive Committee of the North American Company. He has been employed by the North American Company since he was a boy, more than 38 years. He has been a director of our Company since 1933. He is also a member of the executive committee.

H. C. Freeman, a member of the board since 1934, is vice president of the North American Company. He is a former member of the accounting firm of Touche, Niven and Company. He is an accountant of the highest ability. He has been a member of the executive committee of our Company since his election to the board in 1934.

2268 The seventh member is Mr. Frederick H. Piske. He is a vice president of the North American Company and has been an officer of that company for many years. He was elected to the board May 1, 1939, and has not been able to attend many meetings. He has been quite seriously ill for many months, although he is improved and I think will probably be able to take an active place on the board from now on. Before his election to the board, as I have stated, he was a great help to us in financial and corporate matters.

Q. Has there been any dissension within the board of your Company during the last 20 years, or since the period of

2269

North American control? A. There has been no dissension of

—1,121—

any character. I don't know of any action that has been taken by the board since 1922 in which there has not been unanimous affirmative vote by all members present. There has been no dissension or difference of opinion of any kind. There have been discussions between me and members of the board both prior to and following board meetings, but in the board meetings we have never had any disagreement, within the board, and it has made my lot, since I have been running 2270 the Company, very happy when compared with the executives of a different kind of a board. We have had one or two instances in Cleveland where companies have had difficulties, I think largely because of the fact that the board was composed of—the boards were not harmonious.

In our Company there has been no such thing as that. The relationship has been perfect.

Q. Is this harmony in the board of directors important in the business of the Company? A. I don't know how anybody could run a business without it. To me it is essential. I think it is most important. 2271

Q. You mentioned the executive committee. What is the function of that committee? A. The executive committee enables the president and the management to consult with the board or representatives of the board from time to time between directors' meetings. The executive committee has been given very broad powers by the board, in fact its powers

—1,122—

enable it to do anything the board might do except to elect senior officers of the Company. I, as president of the Com-

pany, am in constant contact with the other two members of the executive committee.

Q. With Messrs. Fogarty and Freeman? A. Yes. I go to New York very frequently to consult with them informally and several times a year, probably, we take formal action on certain matters and when that is done minutes of the meeting are kept and submitted to the board of directors at its next meeting and approved and ratified by the board. The board meets quarterly ordinarily, usually in Cleveland,
2273 practically altogether in Cleveland except at such a time as this recent financing when we had to get all the board members at one place at one hour and get things signed down in Washington by aeroplane in order to meet a time schedule. Nearly all of the meetings are in Cleveland and the meetings of the board are very faithful in attending.

Q. How many presidents of the Cleveland Company have there been since 1922? A. Only two, Mr. Robert Lindsay was president from 1921 to 1933, and myself from 1933 to date.

Mr. Lindsay came to Cleveland in 1893 to superintend the building of the Canal Road plant of the Company at that
2274 time. When that plant was completed he was employed as general superintendent and from that time until the time of his death, or until shortly before his death, he was the active

manager of the operations of the Company, that is the production and distribution of the Company's product. He was made vice president and general manager in 1914 and president and general manager in 1921, and under his administration the assets grew from $42,000,000 to $128,000,000.

Q. Now, will you describe for us your own functions as president of the Company? A. Well, I would say that my

functions are many and diverse. Taking them in some kind of order, I determine the personnel of the Company, that is the supervisory personnel. I assign that personnel to its duties, its responsibilities. I make promotions. I determine salaries. I assign department heads and officers to special duties when special occasions arise.

With respect to salaries we have a wage committee consisting of Mr. Hough, Mr. Kermode and Mr. Ober, who pass on salary or wage increases where the salary involved was less than $4,000 a year. On salaries over $4,000 a year, except 2276
the officers of the Company, I determine such salaries and make increases on recommendations after hearing recommendations from Mr. Hough or Mr. Ober, or Mr. Gillie, Vice President in Charge of Sales.

For example, take Mr. Lindseth. Mr. Lindseth was for a number of years an engineer out at our 70th Street plant, in charge of a group of testing engineers. A few years ago I wanted a special survey made of the sales department and I selected him to do that work. I was so favorably impressed

with what he did at that time, that I attached him to my 2277
office and when this rate case matter came up I not only put Mr. Lindseth in charge of the details of the rate case and of the inventory and appraisal made necessary by the rate case, but in consultation with him I detached from the regular operating staff certain members that we felt could be spared and could do the work properly and assigned them to him for that purpose. That is just an example of my action with respect to personnel.

From the publicity standpoint, the publicity of the Company is handled by Frank J. Ryan who is Assistant to the President. I spend a lot of time and a lot of thought with

2278 Mr. Ryan on publicity matters, on how much money may be appropriated for pubilicity purposes in a year, in other words the budget for publicity, and how that money shall be spent as between newspaper advertising or mail advertising, or bill boards, or in what media it will be placed. As I have said in my previous testimony, for the past—since 1933 load building has been our biggest job and consequently I have spent a great deal of time with the advertising department.

The same is true with sales promotion. That is in charge,
2279 as I said, of Mr. H. C. Gillie, Vice President in Charge of Sales. I think I have spent more time in the last seven years, barring rate cases and hearings, with the Sales Department of the Company than any other way. We spend a lot of money in sales promotion. The sales promotion budget runs between 2 and 3 per cent. of our gross revenues and that

—1,125—

money can be spent wisely or unwisely and I have devoted a lot of my time to this sales department for the past six or seven years.

Q. In addition to supervising the work of sales promo-
2280 tion, do you do a little selling, yourself, Mr. Crawford? A. Why, I sell all the time, I think. I try to. I don't let any opportunity to sell go by. If I am out for dinner in the evening I try to sell my host an electric range to have it installed before he invites me the next time. I think that I sell all the time, Mr. Browning. I am awfully keen on that part of the business. I have been successful myself in getting some very large accounts for the Company by constant cultivation and sales work with the executives of those companies.

(Discussion off the record.)

2281

Q. What about the purchasing policy of the Company, Mr. Crawford? A. Of course, that is a big job and it is something that involves a lot of money, with construction budgets running from three or four million a year up to ten million dollars a year, and I devote a great deal of my time to it.

I hold frequent meetings with my associates. We watch pretty carefully the price trends and I try to save as much money for the Company as I can in the buying of materials and supplies. For instance, at the outbreak of the war we determined that copper would probably go up if there were 2282
a war and we bought a year's supply of copper for a little less

—1,126—

than ten cents a pound. We had the money and I felt that it might go up very substantially. I decided that we would buy a year's supply of copper and we got it under ten cents a pound. It did go up but it softened and we have not saved as much money as I thought we might, although we are protected on it.

The same thing is true with fuel. I have interested myself in fuel buying a good deal. While we have a very skill- 2283
ful fuel buyer, the fuel expense of the Company is one of the three or four large items of operating expense and we have maintained under my direction a very substantial inventory of coal for several years. In the first place we have ample storage facilities. We are able, with those storage facilities, to buy when the market is soft and having an ample supply of coal we are able to drop out of the market temporarily when prices stiffen, and as most of our coal burning is slack and as slack is apt to be the bottleneck in the output of the mine, by being able to store slack—and we

have been doing that very successfully, Mr. Maxwell—we can pretty well keep the price of fuel within range.

We have at present about 500,000 tons of coal in storage, which is about five months' supply, and we consume about 25,000 tons a week in the summertime and most of our coal is not put in storage at all. A trainload of coal a day is what we burn, practically. So, I take a great interest in that item of expense.

—1,127—

2285 Then again in the purchasing of the equipment to go into a new plant I am the final authority in the Company on where that will be bought.

Q. You mean where it will be placed? A. Where the order will be placed, where we will get the equipment.

Q. Oh, I see; the equipment. A. Yes. I have to take an interest in that because we have a lot of customers who supply things that are required by us in the construction of a new power plant and we have to maintain some sort of a balance of reciprocity.

In the first place it has been a Company policy for many
2286 years never to buy anything outside of Cleveland that we can buy in Cleveland, all other things being equal. We think it is more important to keep our dollars in Cleveland than to send them any place else. So in purchasing I spend a great deal of time on that.

Then, of course, one of the things we have to do, we have 80 municipalities with whom we do business. I keep many contacts with the governments of the larger of those municipalities. I know the mayor of Cleveland very well, the mayor of Cleveland Heights, the mayor of Shaker Heights, the mayor of Lakewood, and I run into them and talk over the

mutual problems and I don't know that it is a result of that but the fact is that we have practically no trouble and have had no litigation with any of the communities we have

—1,128—

served until this controversy started in 1938. Now, I think part of our ability to settle that controversy was the acquaintanceship that I had with the government.

In the City of Cleveland there has been controversy with one or another of the utilities for years. It had a fight with the Gas Company for several years and is having a frightful 2288 time with the Street Railway Company, in litigation for years. I think our ability to get this last rate matter settled was influenced in some degree by personal acquaintanceship and contacts I have made with members of the government.

Also, the newspapers. I know the editors of the three newspapers. I have made them close personal friends of mine. I see a lot of them. They talk with me about Cleveland problems and I talk with them about our problems. I think that has been very valuable. Of course, I keep in contact with the Public Utilities Commission. If I am in Columbus I will drop in and speak to the Commissioners and I go 2289 to all the hearings on rate ordinance matters and I represent the Company in applications for authority to issue bonds and I think generally our Company could not be on better terms with the Public Utilities Commission of Ohio. We have gone out of our way always to do everything they ask us to and I think the relationship has been a very fine one.

Q. Do you give attention to employee relations? A. I give a great deal of attention to employee relations because I am very much interested in employees. We have about

—1,129—

2290 3,700 of them. As I said before, we have never had any trouble in arranging working conditions or wage levels, or anything. We give a great deal of thought and time to wages and working conditions and to my mind having a proper employee morale and a proper attitude on the part of a large body of employees to the Company, is the finest instrumentality there is for maintaining fine public relations.

You see, we have, as I say, about 3,700 employees and they are scattered all over the territory that we serve. They have
2291 friends, relatives and contacts—a lot of contacts,—and I don't see how you could have proper public relations without having proper employee relations, so I like the men who work for our Company and I am sure they like me.

I mix with them a lot. I am beaten by them at golf and ping pong when I used to play ping pong, and there isn't a man in the Company who feels any embarrassment about coming up to see me about anything he wants to see me about. It is known that he has a welcome in my office so I think it may be said that I devote a great deal of time and attention to employee relations.

2292 I figured out that card and ping pong room for them and at least once every winter I go down there and play bridge for an evening or ping pong for part of an evening. I have played in their golf tournaments and been well beaten by some of them, and they are a great crowd of people. I think there is no finer organization anywhere than the people who work for The Cleveland Electric Illuminating Company.

—1,130—

Q. You have also stated that you have necessarily given attention to the financing problems. A. Yes, I think I have stated that at great length.

Q. What about the collection policies, Mr. Crawford? A. Well, that is a very important matter. We have gone through a major depression and we have had a lot of delinquent accounts both individuals, businesses and municipalities.

Our greatest problem has been the delinquency in street lighting accounts and I have had to devote a lot of time to that and it is still a very important problem. We have brought down our delinquencies very markedly since they reached their peak in 1933 and I think we have a very good 2294
collection record, I mean a record of losses. It runs about .2 of 1 per cent. in a normal year. It got to be over .3 of 1 per cent. in 1932 and 1933, but since conditions have improved we have brought that down to something under .2 of 1 per cent.

Q. Do you participate in matters of major engineering decisions? A. Yes, I do participate very extensively in them. I am not an engineer. I know little or nothing about engineering, but I think I know a good deal about some engineers. I preside at engineering conferences on determining the type, 2295
size and location and capacity of additions, the locations for building new plants, and we have quite some differences of opinion among the engineers in our Company as to the

pressure or temperatures that are to be used in a power plant and I let the boys talk it out and if I can't bring them into accord on it, I take the bull by the horns and decide what it will be, even though I am not an engineer, but it requires a good deal of time.

Q. Do you personally examine operating reports? A. Oh, continually. I have operating reports in minute detail pro-

2296 vided continually and the operating men know that I get these reports and I am watching continually, not only in our own Company but the comparative statistics we get from other companies.

Q. From what other companies? A. From other companies in the—well, on station operation we get monthly comparative statistics from St. Louis, Milwaukee, Detroit and Washington, comparing the economies achieved at the plants, the wages, the cost of the switchboard, and our fel-
2297 lows, of course, know that I get these reports and every once in a while I will mention that I noticed by our last month's report that Ashtabula was not doing quite as well as Lakeside at Milwaukee and they are very valuable and I devote a good deal of attention to them.

Of course, on all major expenditures such as plants and that sort of thing, I discuss with the board. While the board has never put any limitation upon my authority, I am anxious that the board should share the responsibility with me, so that I have frequent discussions with the board on major

—1,132—

2298 engineering matters and very frequent consultations, of course, with the operating engineering staff.

Q. Do you give attention to banking connections? A. Why, I give about all the attention to banking connections that is given. As I have pointed out, we haven't needed to have a highly trained financial expert on our staff and I have, since I have been with the Company as secretary, kept the banking contacts for the Company.

The treasurer of the Company each day, each morning, hands me a list showing the amount of money in each of the banks in which we deposit. We maintain nearly all of our

2299

bank deposits in our own territory, both in Cleveland and in the smaller communities we serve, and I determine in all cases how those amounts will be distributed among these different banks, so that I think that it may be said that I take over many of the duties that would ordinarily be handled by the treasurer of a company.

I have been on the National City Bank of Cleveland board since 1933 and on that board are the heads of many of our largest businesses in Cleveland. The weekly meetings which I attend there keep me in constant contact with those buyers 2300
of large power and it has enabled me to get closer to them and for them to get closer to me. I think it has been a very satisfactory relationship and very beneficial to the Company.

Q. You have participated in civic activities? A. Yes, I

—1,133—

think it may be said that I have participated pretty widely in civic activities. You see, we are the largest industrial unit in Cleveland. We have the biggest investment of any corporation in Cleveland. We pay the most taxes of any corporation in Cleveland, and I think the head of that Company 2301
should take participation in civic activities, and so I have been very glad to do it. I have been active in the Chamber of Commerce. I was chairman of the depositors committee of the closed Union Trust Company for five years and held frequent meetings and conferences on the solution of that problem.

In 1936 I was president of the Great Lakes Exposition and devoted about half of my time to it and all of the time of one of my assistants. It was a good thing for Cleveland. It brought me into contact with a lot of right people in

2302 Cleveland and as I say, while it was hard work, I think I derived some benefits from it and I feel sure that the Company did.

I have been trustee of Cleveland College for a number of years. It does not take very much of my time but Cleveland College is a branch of the Western Reserve University which is downtown in the center of Cleveland and has day and night school for people employed in businesses down town. It has several thousand students and it is a very
2303 worthwhile cause.

I think those participations—as a matter of fact, I have just been persuaded to take over the raising of funds for the annual Community Fund this fall from the utility companies. I am supposed to go out and not only squeeze all

—1,134—

the companies for what I can, but get the employees to contribute as liberally as possible. That means practically devoting one week of my time to that job, which takes place the last week in November, and it is a terrible burden. I have avoided it up to this year, but I yielded this year, so
2304 I will have that to do this year.

Mr. Browning: I think we have reached a convenient stopping point, Mr. Examiner.

The Examiner: All right. We will recess now until ten o'clock tomorrow morning.

(Whereupon, at 4:20 o'clock p. m., the hearing was adjourned to reconvene at 10:00 o'clock the following morning.)

2305

BEFORE THE

SECURITIES AND EXCHANGE COMMISSION

File No. 59-10

IN THE MATTER

of

2306

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1101,
Securities and Exchange Commission Building,
Friday, August 16, 1940,
Washington, D. C.

2307

Met, pursuant to recess, at 10 o'clock a. m.

Before:

W. W. SWIFT, *Trial Examiner.*

Appearances:

(As heretofore noted.)

2308

PROCEEDINGS

The Examiner: The hearing will come to order.

Whereupon, EBEN G. CRAWFORD resumed the witness stand and testified further as follows:

Direct Examination by Mr. Browning (Continued):

2309 **Q. Is The North American Company of aid to you in handling your management problems, Mr. Crawford? A. The members of the staff, the executives of North American Company, are of almost inestimable help to me in management problems.**

Q. Will you give us some examples? A. I think I have testified as to the help Mr. Fogarty has been to me in matters of financing through his experience and acquaintance with the subject.

2310 **Mr. Freeman, who is vice president of The North American Company and a member of our executive committee, and is a member of our board, of course, has been a great help in many ways. Mr. Freeman, before joining The North American Company, was a member of the accounting firm of Touche, Niven and Company, and enjoyed a very high repute as an accountant. His knowledge of accountancy has been available to us and has been of great use to us in the operation of the company. His knowledge of the Federal tax laws has been a great help to us in handling tax matters, so great**

that we have never felt any need for retaining any outside tax consultants of any sort.

In preparing our annual reports to stockholders we have really given Mr. Freeman the last going-over of the report as to style, form and contents. We count largely on his help in that respect. In the preparation of official communications in our negotiations with the City of Cleveland, for instance, on rate matters, Mr. Freeman has been of great help to us and has spent days in Cleveland in some cases working on that sort of thing.

Mr. Shea, president of The North American Company; I have known Mr. Shea for about a year but I have been in 2312
constant contact with him and he, particularly, has been of great aid to me because Mr. Shea's experience in business other than the utility business has been largely in selling experience in a highly competitive business. Mr. Shea formerly was in the oil business and he has advanced ideas on sales methods and business promotion.

Of course, as I have testified, that is the phase of our business in which I think I am possibly the most vitally interested, so the contacts that I have had with Mr. Shea have been many, both in New York and Cleveland. They have 2313
added a great deal, I think, to our ability to move our product and will do so more in the future.

I would say that Mr. Shea's ideas on sales promotion, on budget control, on internal auditing put into effect since his

—1,138—

coming to The North American Company have been of great value and are of great value, and will be of still greater value as time goes on.

I have testified, I think, about Mr. Piske, vice president of The North American Company. At times of getting out

security issues Mr. Piske, since Mr. Fogarty was advanced to the presidency of The North American Company in '34, has been generalissimo in getting out the necessary documents in financing operations.

As you know those things are done at high speed to meet a very exacting time limit and I know of no one—I have seen no one who can carry on such matters with such speed and accuracy and exactness as Mr. Piske has been able to do. His help has been invaluable to us.

2315 That might be said to be true of Mr. Hartel, too, secretary of The North American Company, who, while he has no connection with our company has always pitched in and worked day and night on these matters where speed was important.

Then, Mr. Ed Thierry is an assistant to the president of The North American Company, a writer and an ex-newspaper man. He has been a great help to Mr. Ryan and myself, Mr. Ryan being my assistant in charge of publicity and the preparation and editing of sales matter, mailing sales matter, and also in the preparation of annual reports, put-

2316 ting the finishing touches on and making them readable and interesting, and we have had a great deal of use for Mr. Thierry's time. He comes to Cleveland now and then and

—1,139—

sits down with Mr. Ryan and me and discusses our publicity and brings to us knowledge of the publicity methods of the other companies in The North American System.

Mr. Robert Sealy, treasurer of The North American Company, has been of help to us on a number of occasions. He has been treasurer of The North American Company all through the period in which The North American Company

has held control of our company and at times when we have financed and been in receipt of large amounts of money which we were not spending immediately Mr. Sealy has, on a number of occasions, assisted in our getting that money invested temporarily, either in short-time paper or in interest-bearing savings accounts with New York banks.

Of course, those days are over for the time being when you can get interest on money but there was a time when you could get very substantial return on funds which were not required to be used for months or possibly a year or 2318 two. So, I think that Mr. Sealy can be said to have been really of great help to us in providing the place to put money out where it would earn a little something.

Mr. F. W. Doolittle was a vice president of The North American Company and an engineer for many years. I think he no longer has that title. I think he gave up his official position in New York two or three years ago on account of his health, but has devoted part of his time and most of his time, I think, to consulting work for The North American Company. He has been in Cleveland on many occasions.

—1,140— 2319

When The North American took over control of our company in 1922 Mr. Doolittle spent months out there in consultation with Mr. Lindsay, then president of the company, and was largely instrumental, I think, in bringing many of our practices, engineering practices and recording practices, into harmony with those of the other North American companies. He worked with me in the period previous to 1931 when we were attempting to work up this pension plan. Mr. Doolittle worked with me on the details of that plan and sat in with me on our negotiations with the insurance companies

2320 in an effort to get that plan into operation and shared with me the decision placing the plan into the hands of the Prudential Insurance Company.

Q. Could you give us some examples of the aid of The North American Company on specific problems? A. I think possibly the best example I could give is the problem that we ran into in connection with this rate investigation by the city.

Q. This recent—— A. This recent investigation by the
2321 city which started in the fall of 1938. Our rate agreement with the City of Cleveland had been in effect since April of 1933 and would have expired in July of 1939. We had expected to do as we always have in the past, open negotiations with the city administration for the passage of a new rate ordinance for a period into the future.

Our policy had been that several months in advance of such an expiration we have contacted the city and discussed

—1,141—

the matter of a new ordinance and if we were in a position
2322 to reduce rates to offer rate reductions which we felt we could make, and in order to get the rate agreement extended for a period of years.

In the fall of 1938 we were surprised to learn that a councilman, a member of the City Council, had addressed a communication to the Council stating that the Illuminating Company's property and its earning had never been investigated by the City for 25 years and that we had been able to get rate ordinances without really showing the rate of return that we were earning and the amount of our property, and he suggested that the Council employ an independent

engineering firm to investigate the Illuminating Company before our rate ordinance was extended or renewed.

We opposed that. I opposed it. I talked to the Mayor about it and said I did not think that it was necessary, that it would result in expense to somebody, and on the other hand that we were not at all unwilling to let the City see our books and see our property accounts and our earnings if they wanted to. If they would appoint an engineer we would make our records available to him.

That, of course—and the Council proceeded to vote and 2324
appoint such an engineering firm. I felt that it was necessary, if the City were going to make an analysis of our property and our earnings, that we should employ engineers to do the same thing so that we would not have to rely on an engineering firm employed by the City.

—1,142—

I wanted the engineering firm to be one of high repute. I wanted it to be one that could be truly called an independent firm. I had had no experience with such firms. I knew a number by name, of course. I immediately went to Mr. 2325
Fogarty and we sat down and talked the matter over and we decided that there was one of three or four firms which could properly be called an independent firm for the purposes for which we wanted them. He made an appointment for me with Mr. Gano Dunn of the J. G. White Company and sat in with me while I concluded arrangements with Mr. Dunn and had his firm make this parallel engineering report.

The firm employed by the City proceeded to—we furnished them office space, gave them access to all our records and gave them any help that they asked us for in getting

2326 the records and they proceeded to make a report based upon the so-called historical cost of our property.

The J. G. White Engineering Company, acting for us, made a report based upon the reproduction cost new, less depreciation value, of our property.

Q. Just a minute, Mr. Crawford. One of the problems in that connection was to determine what part of your property was devoted to the service of Cleveland, itself, wasn't it? A. That is true.

2327 Q. That was the major—in other words, it wasn't merely a question of finding out the historical cost of all your properties, but of determining what part of your property was

—1,143—

allocable to Cleveland. A. That is true. The two engineering firms were surprisingly close together on the proportion of the property used and useful to the customers of the City of Cleveland, but they approached it from entirely different angles, one based on the historical cost and the other based on reproduction cost new. Our counsel in Ohio advised without reservation that under the laws of Ohio the reproduc-

2328 tion cost new basis was the correct one.

We found that there was a wide difference between the values and the returns arrived at by the two reports and the two reports were finished at about the same time. We decided that it was for us as a company to call the Council's attention to the difference between the two reports and to explain these differences. There was a very wide difference in the valuation arrived at, about $29,000,000 in the net value of the property used and useful for Cleveland, and the engineering firm employed by the City recommended that rate structures be fixed by the City which would result in lower-

2329

ing our rates in the City of Cleveland by something over $2,000,000 which, if extended to our entire territory——

Mr. Binford: That is for a year?

The Witness: $2,000,000 a year, $2,099,000 in the City of Cleveland—which, if extended to the whole territory, as it would have been under our universal system of rates, would have amounted to something

—1,144—

like $3,500,000 a year.

2330

We, of course, could not agree to that but in the preparation of this reply statement which accompanied our engineering report, we sat down to write that reply statement and we in Cleveland were very indignant and our pens were pretty hot when we started to write this report. We worked for at least ten days on it and I asked Mr. Freeman and Mr. Fogarty to come out to Cleveland and give us possibly a clearer look at the problem than we could have ourselves, having been in the middle of it for months, and I think I can say that our reply statement was a

2331

masterpiece of moderation and understatement due to the work that Mr. Freeman and Mr. Fogarty put on it.

We had a deadline to meet and we all sat up editing and re-editing and marking copy until three or four o'clock in the morning the day before it had to go in to the Council.

That is, I think, the most recent and possibly one of the most graphic examples of the help those two men have been to us. I feel sure that I could not,

2332 *Colloquy*

nor could anyone of my staff, have gotten that reply statement into the beautiful form in which it was finally finished without the assistance of those two men.

Then the Council, after many hearings, reduced their demands and actually passed an ordinance which would have resulted in our reducing our rates by $1,385,000 per year in Cleveland, instead of $2,099,000. We appealed to the Public Utilities Com-
2333 mission of Ohio and under their instructions prepared to take an inventory and appraisal of our property

—1,145—

precedent to having hearings on the matter.

Then again we had had no experience in making such an inventory and appraisal since 1914 and the property at that time was a small fraction of what it was in 1939. There again I asked the help of Mr. Fogarty, went to New York and told him my problem of this inventory appraisal, and that we wanted him to employ the best engineering firm that we could get
2334 to do the thing in the best manner and in the shortest time possible.

After discussions and conferences down there Mr. Fogarty put me in touch with Stone & Webster Engineering Corporation. I talked to the president of that corporation, Mr. Muhlfeld, and made an arrangement whereby they would supervise the taking of this inventory and the appraisal and the study of depreciation so that we could have a case to go before the Commissions. They were also to act as expert witnesses in our behalf in those hearings.

2335

We went ahead full speed. I put Mr. Lindseth in charge of the work on behalf of our Company under the supervision of Stone & Webster Engineering Corporation, and we worked on that from September of 1939 to the latter part of March in 1940. We rented outside space in another building adjacent to ours. We borrowed some of our own people for supervisory help from our operating staff, and employed a lot of engineers and accountants and clerks. As a matter of fact, we had over 200 people working in that other 2336

—1,146—

building on this inventory and appraisal. It was a tremendous job.

We did it under the supervision of the engineers from the Public Utilities Commission of Ohio and I think we were doing a splendid job of inventory, at least so those engineers stated from time to time, that they had never seen an inventory better handled, and they asked us for samples of it to be kept by them in their files as guides for future inventories within the state. 2337

In the latter part of March a member of the Council stated at the Council meeting that this rate case was going to cost the Company a lot of money, was going to cost the City a lot of money, and if the Company won the case, as it seemed to him that they might well do, the Company cost would be handed over to the rate payers to pay back over the period of the ordinance, and suggested that the Company be approached to see whether they would not make a compromise offer which the City could accept.

2338 *Colloquy*

The Council appointed a small sub-committee to act with the mayor and the director of law in the city to consult with our Company to that end.

We had no idea that the offer was coming and we had then the problem of determining what offer we could make and how far we could go in order to settle their litigation which would be expensive and protracted and with no knowledge of the outcome of it. There again we went to New York and spent a week
2339 down there going over with our executive committee,

—1,147—

Mr. Freeman and Mr. Fogarty, and by that time Mr. Shea who had come into The North American organization and Mr. Neal there, the rate expert in The North American organization, with our own rate engineers, and we arrived at an offer of about half what the ordinance provided, that we would make rate reductions largely in the residential schedules which would amount to about $840,000 per year in Cleveland and about $1,400,000 in our system.

2340 We drafted formal communications to the City making that offer and in the draft of that communication Mr. Freeman was of great help. The offer was, after much debate and hearings and discussions, accepted and the rate litigation was ended and the inventory work was brought to a close.

All through that period of that rate case we were in constant touch with The North American staff. They advised us all along the line and certainly they were of great influence and help to getting this compromise offer accepted.

2341

It is much to the advantage of the Company that it was accepted and I think much to the advantage of the community. By that means we received a rate agreement which runs four years from July 7, 1940 that would establish our maximum rates for the period of the next four years. Those men were invaluable to us during that period.

Q. I believe that Mr. Lindseth testified at some length as to contacts of The Cleveland Company with other North 2342
American subsidiaries and that you have mentioned several
—1,148—
of these matters. As president of The Cleveland Company, do you consider that these contacts with the other North American subsidiaries are of benefit to The Cleveland Company? A. I consider them to be a very great benefit. The conferences that we have had in New York among the executive heads of the companies have offered us an opportunity to discuss common problems. In the handling of those problems the methods of the companies are, of course, somewhat different. Our sales methods are entirely different from those 2343
of Milwaukee and St. Louis, for instance, and quite different from those in Washington.

We have, of course, through the years built up a sales policy of one kind and these other companies have built up their sales policies and in some cases they are widely at variance. It gives us an opportunity to discuss whether something that is of value in Milwaukee in sales promotion could be used in Cleveland or whether something that has been proved beneficial in Cleveland might be equally beneficial in St. Louis.

2344 For instance, St. Louis and Washington were away ahead of us in refrigeration, first, and in air conditioning, second. That was probably largely due to the climatic conditions in those cities as compared with ours. It is hot in Washington in the summer and it is equally hot in St. Louis in the summer, whereas our summers are pretty bearable, so they got a great lead due to those climatic conditions in selling refrigeration and in selling air conditioning, and in these con-

—1,149—

2345 ferences with New York we were able to get from them what they did and what they did not do and it has been a great help to us.

I consider those executive conferences very beneficial. The Station Advisory Operating Committee, as Mr. Lindseth has testified to, from an executive point of view is a very great help to me. For instance, in the building of this new plant which we are putting up at East 70th Street. That plant is being constructed on the mat which supported an earlier plant which was demolished in 1931. We had to make tests of the capacity of those foundations of the earlier

2346 plant to hold the heavier weights which were required for these larger units, both electric generators and boilers, and we were faced with a number of problems.

We made exhaustive tests of the bearing capacity of that concrete mat which is the basis of the foundation. We went to the most expert persons we could learn of and in that connection there was a professor at the University of Michigan. He gave us a report that the foundations were amply strong, but in an effort to make sure of that fact we wanted to make our buildings as light as possible and still be as strong as possible so the question of the weight of the stacks

that would be in this plant; there would be two stacks to exhaust the boilers and the furnaces had we built brick and reinforced concrete stacks such as the other stacks on our plants they would have weighed about 650 tons apiece and

—1,150—

we wanted, if we could, to get a lighter stack if it could be done with safety and the Station Advisory Operating Committee, our representative on that committee took it up with the committee, and we learned that in Detroit they had had success with a steel stack lined with brick, a welded 2348
steel stack, which instead of weighing 650 tons would weigh about 450 tons. The problem was whether or not that stack would be satisfactory for us because we burn a different type of fuel than Detroit does, with a higher sulphuric content, and this Station Advisory Committee discussed it and recommended that a steel stack be used, but that a special acid-resisting tile or brick be found for the lining. We adopted that recommendation and it was so specified that these stacks would be of that character and design. That is just merely one instance of the value of the Station Advisory Operating Committee. 2349

I know less about the value of the Electrical Committee because I am not an electrical engineer and their meetings are highly technical, but I do know that our engineering staff feels that they have been benefited greatly by these semi-annual meetings of the Electrical Committee.

We have Purchasing Agents' Conferences at which the purchasing agents of the various companies meet and get together for a day or two and they discuss their problems in the matter of commodity prices and trends. I think those are of value.

2350 *Eben S. Crawford—By Respondents—Direct*

The accounting officers, auditors of the Company, have a

—1,151—

meeting at which they discuss their problems of internal audits and budgets and controls and forms, work orders, etc. I haven't attended those meetings but I get a report from our comptroller on his attendance at the meeting and I know that he feels that those meetings are of value to us.

I think these inter-company contacts are very valuable, have been of value to us and I think they have been of value
2351 to the other companies. For instance, we have had in Cleveland since 1911 a municipal light plant in competition with us. A few years ago there was a movement in Milwaukee to establish a municipal light plant there and Mr. Way asked me if he could send a representative of his company down to discuss with our people the municipal competition, and he sent Mr. Schmidtman.

Mr. Schmidtman, I think, was in Cleveland for two or three weeks consulting with our service department and our sales department and our publicity department, on the matter of municipal competition. I feel certain that he
2352 would not have stayed that long if he had not been getting information that he considered to be of value to him.

Of course, people in Milwaukee decided that they did not want a municipal light company and voted it down, but I have no doubt that that visit of Mr. Schmidtman's would have been helpful to the Milwaukee Company had Milwaukee taken a different course.

Q. Mr. Crawford, you feel that you have a fine Company in Cleveland? A. I think we have the finest Company in the

—1,152—

United States.

Q. Notwithstanding that fact, do you feel that you have anything to learn from these other companies? A. Oh, a great deal. I think one of the things that an executive must beware of is satisfaction with the results he achieves. Once a company, an organization, or an executive gets the feeling that he is handling the job perfectly he is perfectly certain that that will result in slipping and most unsatisfactory results, and so we feel that while our Company has made an outstanding record in every respect—I don't for a minute think that we take care of every detail of our business better 2354 than anyone else does. As a matter of fact I know that some of these companies in The North American System do certain things better than we do.

For instance, a year or two ago I noticed that the Milwaukee Company was awarded the C. A. Coffin medal by the Edison Electric Institute. That awarded to them on two bases: fine operation of their power plant at Port Washington, and their outstanding record in reducing the cost of billing and collecting domestic consumer accounts.

This billing and collecting cost was very much lower than we have ever been able to do it and I did not waste any 2355 time in sending two competent men to Milwaukee and finding out how they did it. Those men spent several days there and came back and told us how they did it.

—1,153—

Well, part of it was due to their having a new and excellently designed building where they could take care of customer contacts, application for service, payment of bills, adjustment of complaints. It had been studied out to the finest detail in eliminating time and space. They had done

2356 a magnificent job. We could not do that because we have an old office building which was built in 1912 as a general office building. It was not designed particularly for our purposes as they are now, so that we could not adopt all the things that were done by Milwaukee in this regard but we did succeed in making corrections in our operation which will effect rather substantial savings in the cost per bill.

That will result not only in savings to us in billing consumers, but in reducing the inconvenience to customers in
2357 shortening the time that they are required to be in our office on those matters.

I feel sure that each of these companies has learned a great deal from the other. Station Operating Engineers, Design Engineers, Electrical Engineers, Accountants and Purchasing Agents have meant a lot in the past and I think they will mean a lot in the future, and I think any disassociation of these companies with the result that these committee meetings would be closed out or discontinued would prove expensive to each of the companies.

It might be thought, I suppose, that if the companies
2358 were disassociated that these contacts and committee meetings would continue and they probably would for a period of

time, but it is my judgment that they would not continue indefinitely. There is a lot of work connected with them. If there weren't some influence brought to bear on members' companies to go I feel certain that from time to time one company might drop out or another one, and in due time there would be no such committees and no such contacts.

As a matter of fact, I know of no other group, or no disassociated companies which have these inter-company

committees and I think the thing that has held them together through the years and will hold them together, is a common mutuality of interest and a common selfish stock interest, selfish in the sense that it means saving money for the companies. I am convinced that they ought to be continued and I think the only way to insure their continuation is to continue a common association and a common ownership.

I would say that the most important benefits of our association with these other companies in The North American group has been this fine help that we have gotten from the 2360
executives of The North American Company at all times on financing and other problems, and the fine results that have been achieved by these committees.

For instance, the Station Operating Committee. I get monthly—I think I have it here with me—inter-company statistics which show the plant operation records of the Ashtabula, Avon and Lake Shore plants of our Company,

—1,155—

the Lakeside and Port Washington plants of the Milwaukee Company, the Cahokia plant in St. Louis, the Connors' Creek and the Trenton Channel plants of the Detroit Edison 2361
Company, and the Buzzards' Point plant of the Washington Company. Each month I get one of these sheets and our engineers, of course, know that I get it and study it and they vary from month to month, showing that Cleveland at one time has improved their operating efficiencies as compared to some of the other companies, and some other months some of the other companies have the jump on them. This is like publishing the standing of teams in the American League and it has been of tremendous value to us.

2362 *Eben G. Crawford—By Respondents—Direct*

Q. Is there a rivalry between the companies, Mr. Crawford? A. There is a very intense friendly rivalry between the companies. It is a rather amusing thing because it means that about four people out of five are bound to be wrong. I am perfectly convinced that we are doing the best job of any company in The North American System, and I insist that we continue to do what I think is the best job of any company in The North American System, but I am sure Mr. Way or Mr. Neal are just as satisfied that Milwaukee
2363 and Washington are far ahead of us in their performances. I think that rivalry not only among the executives but among the operating forces is a great inducement to continue effort towards improving the service and improving the results of the service.

—1,156—

Q. Mr. Crawford, do I understand correctly that you feel that the common stock ownership which links these companies together is essential to this rivalry and to this continued close contact? A. Well, I feel very strongly that that is the case. Due to this common ownership and this
2364 mutuality of interest we exchange information with these companies that we would not think of exchanging generally.

Q. Who, in your company, passes on interchange of information with other companies? A. Well, all requests for such interchange of information go to Mr. Hough, our vice president and general manager, and if there is any question at all as to whether or not the information should be given the matter comes to me and I make a decision as to whether or not it shall. No information is passed out of our company without my knowledge and approval of it.

Q. That is, you have established the general policy and also pass on specific cases? A. Yes, that is a Company order.

Q. So that The Cleveland Company is not exchanging information with other companies except as you, yourself, permit or direct it? A. I would say that this is true except with possibly unimportant matters. If a company were to write us and say "Do you do your own tree-trimming or do you have it done by contract?" that would not be referred to me,

but on matters of information as to our operations or our costs or any of that sort of thing would have to come to me for my approval.

Q. Now, as president of the Company, do you permit the intimate exchange of detailed information with non-associated companies?

The Witness: Will you read that question?

(Pending question read back.)

Mr. Binford: I object to the question until the word "non-associated" is clarified. Do you mean companies which are not part of The North American System? 2367

Mr. Browning: Right.

Mr. Binford: If you make the question that way I will withdraw the objection. Is the question so changed?

The Witness: Will you read that again now?

Mr. Browning: Let me rephrase the question.

As president of the Company, have you permitted the intimate exchange of detailed information with

2368 *Eben G. Crawford—By Respondents—Direct*

companies which are not subsidiaries of The North American Company, other than Detroit Edison?

The Witness: No, I have not.

By Mr. Browning:

Q. And would you permit such exchange of intimate information with any such other companies? A. Well, I would have to weigh that matter in each specific instance

—1,158—

2369 before I would consent to give it. I can't say that I would not give another company information that they asked for, but as a matter of practice we don't do it and unless it was on some specific matter where we could not see that it would have any effect on our operations, I would refuse such requests for information.

Q. Mr. Crawford, will you tell us what has been the effect of North American control of your Company upon localized management of your Company? A. I think the control of our Company by North American Company has had no effect whatever upon the local nature of our management in Cleve-

2370 land or of our organization. Our staff is composed of people long resident in Cleveland, most of whom have spent their life in service of the Company.

The public realizes and feels that in dealing with us it is dealing with a Cleveland organization. I don't see how any organization could be more local in its character than is the whole employee body of The Cleveland Electric Illuminating Company.

As president of the Company I have complete control over the operations of the Company, subject to the general super-

2371

vision of the board. There have been no limitations placed upon my authority. I have full authority to deal with any problem that may come up. My judgment and my decisions have never been overruled by a board. I have never been asked to take any action of which I did not fully approve.

—1,159—

On the other hand, all the time that I have been president of the Company I have been in close contact with the executives of The North American Company. We have constantly discussed the problems of the Company and these discussions have not been just perfunctory. They have run for hours and sometimes for days.

2372

Sometimes I have gone down there to get their opinion merely to confirm my own judgment in the matter and to share the responsibility with me of having made this decision. Many times I think I have gone down there with my mind made up on a specific problem and after conference with Mr. Freeman and Mr. Fogarty and Mr. Shea, I have probably changed my mind or modified my decision in the matter.

2373

I don't know that in any one instance such as, for instance, the determination of this compromise offer in this rate settlement with Cleveland, I could not say that I or any other one participant in that was the originator of the settlement finally arrived at. Those men are of great value to me because—well, they are not into the detail, they can see the forest without being obstructed by trees, as it were. They are men who not only know our problems, but in many cases have met the same problems in their other companies and they are experienced in those other subsidiaries in large cities and have certainly been of great help to us.

2374 Then, they have a very strong interest, I think, in arriving at the proper solution, helping me to arrive at the proper

—1,160—

solution of our Cleveland problems in the size of the investment that they have, the stake that they have in the property. That is a very important thing.

I have often found that the thing that seems to me to be a rather weighty problem has already been met in other companies and the proper answer been found. I think prob-

2375 ably in the seven years that I have been head of The Cleveland Company I have averaged fifteen visits a year, at least that many, in the office of The North American Company, and many times Mr. Fogarty and Mr. Freeman, particularly, and Mr. Piske occasionally, have been out to see me.

I am sure that not a week goes by that I am not in contact with Mr. Fogarty or Mr. Freeman or Mr. Shea, or all of them, by telephone. I keep in constant touch with them. Their help has been invaluable. I don't know how you would value it in money but it has given me a very substantial backing in important decisions.

2376 It would certainly be greatly missed if that help were taken away. Of course, if our stock was divided up among a lot of people, I don't think there would be anyone who would have a sufficiently great stake in the Company to devote the time and effort.

For instance, I think my selection to be president of this Company, which was certainly made by The North American Company, probably would not have been made—I mean that

—1,161—

I probably would not have been selected to be president of this Company on the occasion of Mr. Lindsay's death if there

had not been someone who, by contact with me and knowledge of my capabilities, could make that decision. I had been secretary of the Company for many years and as a rule presidents of large corporations are not succeeded by secretaries of that organization. It resulted through Mr. Lindsay's long illness and the many contacts that I had with The North American Company that they, having, of course, the controlling stock ownership, could nominate me as president. They did and I have been very happy in it. The job has been made easier by these fine associations and the help I 2378
have gotten from these men. I don't like to think of the possibility of that help being withdrawn and I hope it won't be.

Q. Would an independent engineering or management firm take the place which North American has with you? A. I don't know what you mean, Mr. Browning. Do you mean could the Cleveland Electric Illuminating Company employ a management concern that would be a fit substitute for the help we have gotten from The North American Company?

Q. Yes. A. I don't think it would be possible. 2379

Q. Why not? A. Well, because of the long acquaintance that these men have had with our operating problems. I don't think we could retain elsewhere in any one place the

all around help from many points of view that have been given to us by the staff of The North American Company.

Q. Well, do you feel that the element of common stock ownership has any importance? A. I think that it is the important element. The North American Company has a tremendous investment in Cleveland. It is these men's job

2380 *Eben G. Crawford—By Respondents—Direct*

to help the local management operate these companies. I think it is the strongest possible factor.

Mr. Browning: That is all.

Mr. Binford: Mr. Examiner, I wonder if we could recess until 1:30 o'clock, at which time I would be prepared to go on with cross examination. It is now after eleven.

The Examiner: I think that is in order. We will recess until 1:30 o'clock.

2381

(Whereupon, at 11:10 o'clock the hearing recessed, to reconvene at 1:30 o'clock p. m.)

—1,163—

2382

AFTERNOON SESSION.

(Whereupon, at 1:30 p. m., August 16, 1940, the hearing was resumed.)

The Examiner: Let us resume, gentlemen.

Whereupon, EBEN G. CRAWFORD, the witness on the stand at the time of recess, resumed the stand and testified further as follows:

2384

Cross Examination by Mr. Binford:

Q. I believe you testified, Mr. Crawford, that the advice and assistance of Mr. Fogarty, among others, of The North American Company, was of great value to you in your recent financing, is that true? A. That is very true.

Q. Mr. Fogarty not only advised you in connection with the most recent bond financing of your company, but also negotiated—and I believe you said fought or struggled—with the underwriters, in connection with the final completion of the deal, is that true? A. Will you say that again, please? 2385

Mr. Binford: Please read that.

The Witness: Ask that again, please.

(Whereupon the pending question was read back by the reporter.)

—1,164—

The Witness: Mr. Fogarty began the negotiations with the bankers on our behalf and, in the final negotiations with the bankers, with respect to the price at which the bonds would be sold, he sat with me in

2386 those negotiations and shared with me the burden of getting the best possible price for the bonds, which I think we succeeded in doing.

By Mr. Binford:

Q. You testified, on direct examination:

"Mr. Fogarty handled all necessary negotiations with the bankers, except getting down to the final
2387. trading for a half point, when I stepped in and reinforced him somewhat."

That is a correct statement of the situation? A. Substantially correct, yes.

Q. Yes. It may be modified by the remainder of your testimony on that subject, on direct examination. A. Yes.

Q. You also testified that no members of your staff were particularly familiar with provisions common to mortgage indentures securing bond issues—that is true, is it? A. No members of our staff are familiar with such things.

2388 Q. And that you received assistance in connection with the mortgage indenture executed to secure the bonds most recently issued by you from the officials of The North American Company? A. The officials of The North American

—1,165—

Company were very actively of assistance in arriving at the provisions of the mortgage.

Q. Who drafted the mortgage indenture? A. The mortgage was, I presume, drafted by our counsel with the assistance of the staff of The North American Company as to detail.

2389

Q. What individuals of your counsel? A. I would say that Mr. Cissel of Sullivan and Cromwell, Mr. Bickel of Squire, Sanders and Dempsey, principally.

Q. Squire, Sanders and Dempsey are a firm of attorneys practicing in Cleveland? A. That is true.

Q. Where was the indenture drafted—in New York? A. In New York.

Q. Do you know if a member of the Cleveland firm was in New York continuously during the drafting of that indenture? A. Mr. Bickel was there continuously. I say "continuously"—practically continuously; I don't know but that he may have been back in Cleveland for a day during that period, but he worked continuously on that indenture with Mr. Cissel.

2390

Q. Mr. Fogarty made or carried on all the preliminary negotiations with the underwriters, up to the time when agreement in final form became necessary as to price and spread? A. Mr. Fogarty carried on all the negotiations up

—1,166—

to that point, with this exception, that at a meeting—at an underwriters' meeting, held in the offices of The North American Company, I attended that meeting, which was presided over by our counsel, and answered such questions as underwriters' representatives cared to ask about the Company and the property and the operations of the Company.

2391

Now, that is the only time that I appeared in what might be called the negotiations, until the final conference at which the price was fixed.

Q. What was the date of the conference, which you mentioned as being presided over by your counsel? A. It was

on Tuesday before the offering. The offering was on Friday, I think, July 19.

Mr. Browning: That is right.

A. (Continuing) And this conference, I think, was held on the Tuesday before that.

By Mr. Binford:

2393 Q. Prior to that time did any official of your company, by which I mean The Cleveland Electric Illuminating Company, who was not also an official of The North American Company, represent the Cleveland Company in any negotiations with underwriters? A. Did not.

Q. You say that your counsel presided over the particular meeting that you mentioned. Which of your counsel?

—1,167—

A. Mr. Cissel of Sullivan and Cromwell, and Mr. Bickel of Squire, Sanders and Dempsey was present.

Q. Where was that meeting held? A. That was held on the 16th floor of a building on 60 Broadway in that city.

2394 Q. That is the building owned by a subsidiary of The North American Company? A. That is right; in which the offices of The North American Company are located.

Q. Does your company maintain an office or office space at that address? A. Yes, we do.

Q. Of what does your office force there consist? A. We share rent for a certain amount of space on the 18th floor of The North American building, with two other of the associated companies, and we share in the salaries of a group of employees located on that floor. That group of employees

2395

consists of Mr. C. E. Neil, who is a rate engineer, Mr. W. C. Leinig, who is a statistician, and—I am not sure of Mr. Johansen's initials——

Mr. Hamilton: (Interposing) J. G.

A. (Continuing) ——J. G. Johansen, who is assistant secretary of our company, and various clerks and stenographers.

—1,168—

By Mr. Binford:

2396

Q. This office is maintained continuously by your company? A. It has been maintained continuously for a number of years.

Q. How many years? A. I think since 1935.

Q. At what expense during the year 1939, as nearly as you can state it? A. I would say, as nearly as I can state it, about 20 thousand dollars.

Q. To whom do you pay that 20 thousand dollars—to The North American Company? A. We are billed for our proportion of the salaries of these employees, and we send the check to Mr. Johansen, who is an assistant secretary of 2397 our company.

Q. Of your company? A. Yes.

Q. Who bills you? A. I think Mr. Johansen—just on a statement, I mean, of our share. I don't know how the bill is made out.

Q. He doesn't bill you on any particular letterhead in any particular capacity? A. I can't say as to that.

Q. Do you know who makes the allocation of 20 thousand dollars—or whatever it may be—to you each year? A.

—1169—

2398 It is done at cost and it is proportioned, and I don't know the exact proportion. I think it closely approximates a third to each of the three companies—The Union Electric of St. Louis, the Milwaukee Company, and ourselves.

Q. You mean The Union Electric Company of Missouri? A. Of Missouri, yes.

Q. You don't know who figures those costs, then? A. Well, I assume that Mr. Johansen figures them.

Q. You assume that? A. Yes.

2399 Q. As an officer of your company, isn't Mr. Johansen directly under your control and supervision? A. He is under my control and supervision in his duties as an officer of the company, of course.

Q. But you are not sure as to whether or not he figures the costs personally on this matter? A. I can't be sure of that.

Q. This office space is rented from The North American Company or from 60 Broadway Building Corporation? A. It is leased from the Building Corporation.

Q. Which is a subsidiary of The North American Com-
2400 pany? A. As far as I know, it is.

Q. The 20 thousand dollar figure which you mentioned as the approximate cost of the New York organization to you

during the year 1939—would that include the rent? A. That includes the rent, yes, sir.

Q. That is, your portion of the rent? A. Our portion of the rent, yes, sir.

Q. Do you fix the salaries of the employees in that office? By "you", I mean you personally as president. A. Oh, no. I do not.

2401

Q. Do you know what they are? A. I don't know exactly what they are. I know about the range of them.

Q. Did you employ any of the members of the staff of that New York office yourself? A. No, I did not.

Q. Was the employment of any of them made by your Board of Directors? A. The election of Mr. Johansen as assistant secretary of the Company was made by the Board.

Q. How long has Mr. Johansen occupied that position? A. Well, I couldn't say. For several years.

2402

Q. Has he occupied it since prior to the time that you became associated with The Cleveland Electric Illuminating Company? A. Beg pardon?

Q. Has he occupied it since prior to the time that you became connected with the Cleveland Company? A. Oh, no.

—1,171—

Only in the last few years. He is a young man.

Q. Who occupied the position held by Mr. Johansen immediately prior to the time when he was elected to that position? A. I think, before this arrangement was made, that Mr. Sealy was—the treasurer of The North American Company was an assistant treasurer of our company. I don't think we had an assistant secretary.

2403

Mr. Browning: Let me interrupt there.

The Witness: I am relying on my memory. I haven't any record books here.

Mr. Browning: Don't you think Mr. Piske was the assistant secretary?

The Witness: Well, I don't know. I don't remember.

2404

By Mr. Binford:

Q. But there was someone who occupied that position? A. That is right. We had an assistant secretary or treasurer in New York.

Q. What did Mr. Johansen do? That is, what was his occupation prior to the time when he—— A. (Interposing) —He was employed by The North American Company.

Q. In what capacity? A. I don't know that he had any official capacity at that time. He was employed under Mr.

2405

—1,172—

Piske.

Q. Where does Mr. Johansen live? A. He lives in New York, as far as I know.

Q. He doesn't live in Cleveland? A. No.

Q. Has he ever lived in Cleveland? A. No, sir, as far as I know.

Q. What are his duties in so far as your Company is concerned? A. Well, his duties are—he has authority to sign as an assistant officer for us. He did so sign in the

2406

recent bond issue. He and the rest of that department furnish us with statistical information with respect to the other companies of the North American group. They furnish the stock exchange with the required information. They get out confidential reports to insurance companies, to state banking departments, they answer inquiries of investors, investment bankers, and do quite a substantial amount of work.

Q. I will ask you to refer to Respondents Exhibit Number 30—— A. (Interposing) May I have a copy of it.

(Mr. Hamilton hands a document to the witness.)

2407

Q. (Continuing) ——which is the organization chart of The Cleveland Electric Illuminating Company. Is Mr. Johansen's position or staff reflected in this chart? A. I

—1,173—

think not. It is our operating chart in Cleveland.

Q. Are there any other paid officers or departments of your Company that are not reflected in the chart? A. No, there are no other such officers or employes that are not reflected in this chart.

2408

Q. Could you state what Mr. Johansen's salary from your company is? A. I can't state with any degree of positiveness. It is very small—his salary from our company.

Q. I presume that, if any expenditures are made on behalf of The Cleveland Electric Illuminating Company by your New York staff, your company is billed for those expenditures? A. Undoubtedly.

Q. I am speaking of disbursements or expenses incurred in addition to your pro rata part of the normal running expense. A. As I understand it they have a petty cash account down there, which they account for to our treasury department periodically, and are reimbursed for expenditures out

2409

of that petty cash fund.

Q. Would you classify Mr. Johansen as an expert in financial matters? A. I wouldn't know as to whether Mr. Johansen was expert in financial matters, with respect to negotiation of loans or financing of that sort. I think he is

—1,174—

very expert in the details of arranging of closings and financial operations.

Q. You don't know what his total compensation is from The North American Company and the various subsidiary

companies which he serves? A. I don't think he is an employee of The North American Company.

Q. When you stated a while ago that, prior to the meeting which you mentioned as being presided over by your counsel, with the underwriters, in the latest financing of The Cleveland Electric Illuminating Company, you had had no previous contact with the underwriters, did you include correspondence and telegraphic or telephonic communications, as well as personal conversation? A. I had had
2411 no contacts with him whatever, of any character.

Q. Who selected the underwriters, then, or do you know? A. Well, Dillon-Read selected participants in the syndicate —Dillon-Read were selected by us and they formed their own syndicate.

Q. When you say "by us"—— A. (Interposing) By Mr. Fogarty and myself.

Q. (Continuing) ——what persons do you mean? A. By Mr. Fogarty and myself.

—1,175—

Q. But you didn't contact Dillon-Read yourself, person-
2412 ally. A. Not in the early stages, no. I knew that Mr. Fogarty was in contact with Dillon-Read.

Q. And Mr. Fogarty selected your New York counsel? A. Mr. Fogarty—pardon me?

Q. Selected your New York counsel in that case, too? A. Sullivan and Cromwell have been our New York counsel for many years.

Q. Over what period of years? A. They have participated in our financing for as many years as I have been with the Company, representing us in New York in the

financing. They have been on a retainer from us for a number of years—I wouldn't like to say how many, but for a good many years.

Q. Would you say that they had been so retained since The North American Company acquired control of The Cleveland Electric Illuminating Company? A. You mean by that, during all the period——

Q. (Interposing) Yes A. No, I think it hasn't gone back as far as that.

Q. Did The Cleveland Electric Illuminating Company 2414
have New York counsel prior to the time when The North American Company acquired control of The Cleveland Company, do you know? A. I do not know. I know that we had

—1,176—

no permanent counsel.

Q. Were you consulted? In this case, by "you", I mean you personally. Were you consulted as to the houses which should be included among the underwriters selected by Dillon-Read for your last financing? A. Yes, I was.

Q. To what extent? Merely to the extent of those in Cleveland who should participate? A. That is true. Merely 2415
as to those who were in Cleveland and in Ohio.

Q. Approximately what figure in dollars was the amount of the underwriting spread on this latest Cleveland financing? A. It was two points on 50 million dollars. That would be one million dollars.

Q. Dillon, Read & Company was the manager of the underwriters in that transaction? A. They were underwriters.

Q. How much was the management fee? A. I do not know.

2416 *Eben G. Crawford—By Respondents—Cross*

Q. If that figure is revealed in the registration statement and amendments, as filed with this Commission in connection with that issue, the figure so revealed would be correct, would it not? A. I would assume so.

—1,177—

Q. In other words, you checked or caused to be checked the registration statement filed here, before it was filed? A. Oh, yes.

Q. What counsel fees were paid in connection with that?

2417

Mr. Browning: I don't like to object, Mr. Examiner, but I don't quite see the relevancy of this line of questioning.

Mr. Binford: Mr. Examiner, there has been a great deal of direct testimony here, to which I didn't object, for the purpose of showing the local control and the desire upon the part of the management to put money into circulation in Cleveland by local purchases. I believe that the other side of the picture should be brought out, too.

2418 The Examiner: I believe that refers to the question on direct examination. I will overrule the objection, if it was an objection.

Mr. Browning: I don't object, particularly, to the question, because it is a matter of public record. I just thought we were getting a little far afield.

The Witness: Is there a question not answered?

Mr. Binford: Yes.

The Witness: What was it?

Mr. Binford: Read it, please.

(Whereupon the pending question was read back by the reporter.)

—1,178—

The Witness: The total of the counsel fees, as I remember it, was 40 thousand dollars.

By Mr. Binford:

Q. Do you know what proportion of that went to Cleveland counsel? A. I do.

Q. How much? A. 16 thousand dollars. 2420

Q. There was a great deal of printing and engraving done in connection with that financing, was there not? A. A very great deal.

Q. Approximately how much did those expenditures amount to? A. It would only be a guess, if I answered that. I don't know.

Q. You don't know approximately? A. I do not know approximately. It would be a guess. I have an opinion, but I don't know.

Q. Would you say it was in the neighborhood of five, ten or twelve thousand dollars? A. My impression is around 2421 nine thousand dollars, but I am not sure of that.

Q. Who made the arrangements for that printing and engraving to be done—what individual? A. What individual?

—1,179—

Q. Yes. A. I think Mr. Hartel, the secretary of The North American Company, probably made those arrangements.

Q. Mr. Hartel lives in or near New York, is that true? A. Yes.

Q. His office is at 60 Broadway? A. His office is there.

Q. New York City? A. New York City.

Q. Did Cleveland or Ohio firms do the printing and engraving? A. No. The American Bank Note Company printed the—— The temporary bonds, you mean?

Q. Whatever printing or engraving that had to be done. A. Well, the American Bank Note Company printed the temporary bonds, and a New York printing firm did all the other printing. I have forgotten the name of that firm. No Cleve-
2423 land firm would have been equipped to do that printing in the time that was available for doing it.

Q. The familiarity of the officials of The North American Company with such matters, and with firms which were in a position to do that type of work, was of value to you in that connection, too, wasn't it. A. It was of great value to

—1,180—

us. This was a very high speed operation from start to finish.

Q. You have already dwelt upon Mr. Fogarty's knowledge of technique and practices of financing operations, and
2424 their value to your company. I suppose you also benefiitted, you feel, from Mr. Fogarty's personal acquaintance and knowledge of investment banking firms and their reliability. A. Yes, that is true.

Q. I believe you stated that the members of the Executive Committee of The Cleveland Electric Illuminating Company exercised powers of the Board between the meetings of the Board of Directors, is that true? A. Yes, that is true.

Q. And you further testified that this Executive Committee was composed of yourself, Mr. Fogarty and Mr. Freeman? A. That is correct.

2425

Q. How often does the Executive Committee customarily meet? A. Well, it meets formally only when some formal action of the Committee is to be taken. It meets informally very many times in a year. We might, in some years have the minutes of three formal actions by that committee, and another year it might be two, another year it might be four, but we are in constant communication with each other, and I spend a great deal of time with Mr. Fogarty and Mr. Freeman in New York on matters of which no record is made of

—1,181— 2426

the minutes.

Q. In other words, if quick action is required on some important matter, you may call Mr. Fogarty and Mr. Freeman by phone and get their opinions and act on the consensus of opinion of the three of you, as on the authority of the Executive Committee as such, is that true? A. On any emergency of any kind, of any importance, important matter, I would endeavor to have a meeting by going to New York or inducing Mr. Fogarty or Mr. Freeman to come out to Cleveland, and we would make a minute of formal action to be approved later by the Board. 2427

On just general routine matters of operation and management, if I know that I am going to be in New York within a few days, why, I may defer acting on it until after I have been to New York and had a talk with Mr. Fogarty and Mr. Freeman.

I can see where at times I may have called one or both of them on the phone and asked them to talk it over among themselves and call me back and, when we were agreed upon it, I would proceed.

2428 Q. About how often do yor usually make a trip to New York? A. I would say it would be an average of about once a month.

—1,182—

Q. And your stay in New York at that time usually covers a period of two or three days? A. Very often only one day or maybe two days or maybe three days. I get out of New York just as quickly as I can. I stay long enough to do the business that I went down to do and leave as early
2429 as I can.

Q. Is there usually a formal meeting of the Executive Committee each time you go to New York? A. There are no formal meetings unless we have some formal action to take. It is a case of sitting down around a table for an hour or two or three or eight, discussing the matters that are up at that moment.

Q. I believe you stated that no action of the Executive Committee had ever been overruled by the Board. A. That is true.

Q. I believe you also stated that, as far as you can recall,
2430 since you had been president, there had never been any action by the Board that was not unanimous. A. As far as I can remember we have never had a dissenting vote on any action taken by the Board.

Q. What was the name of the gentleman whom you spoke of as possibly occupying the position as representative of the minority interests on the Board? A. Mr. W. H. Fillmore of Cincinnati.

Q. Why did you so characterize him in your direct testi-

—1,183—

mony? A. Well, Mr. Fillmore became a director of our company, I think I testified, in 1907—at least away back—and a large amount of our common stock was owned in Cincinnati and Mr. Fillmore, in those early days, used to solicit proxies from the minority stockholders and was usually elected by means of those proxies. As long ago as—well, ever since The North American Company has been in control of The Cleveland Electric Illuminating Company, their stock has been voted for the election of Mr. Fillmore, I think, even beginning in 1922, so that, while he originally was elected 2432
to the Board by the votes of the minority stockholders, he has received the votes of all proxies ever since 1922.

That was the cause of my reference to him as possibly being considered a representative of the minority.

Q. He himself is a stockholder? A. Yes, he is a stockholder.

Q. Do you know approximately how much stock he owns? A. He owns a very substantial amount.

Q. Would that mean two hundred or three thousand shares, or in what way—— A. (Interposing) I would say in excess of three thousand shares. 2433

Q. When was the last stockholders meeting of The Cleveland Electric Illuminating Company? A. Our stockholders

—1,184—

meeting is held the last Wednesday in March of each year, so it would have been in the latter part of March this year.

Q. It was so held this year? A. It was, yes.

Q. Do you know how many persons attended in person? A. Not a soul other than the proxies. It was the first time in our history. That is why I happen to remember that. We

usually have two or three to eight stockholders present. Each stockholder, however, got notice of the meeting.

Q. Accompanied by a blank proxy form? A. That is right.

Q. Do you know what percentage of the total voting stock was represented—I started to say "in person or by proxy"; I mean "by proxy". A. I can only say approximately, but I think, as a rule, that between 90 and 92 per cent. of our stock votes at annual meetings, and that includes the com-
2435 mon and the preferred shares.

Q. You are speaking, now, in general? A. In terms of the proportion of the total outstanding stock that is voted.

Q. But you are not speaking of this particular meeting in March 1940? A. No. I can't state as to the percentage at that particular meeting, no.

—1,185—

Q. I presume that the stock was voted unanimously in favor of each resolution that was passed? A. That is true.

Q. To whom did the proxies so solicited run? A. I think
2436 they ran to E. G. Crawford, F. M. Cobb, and W. H. Fillmore.

Q. You or Mr. Cobb, I presume, cast the ballots? A. No. We all cast a ballot.

Q. The three of you, then, were present? A. The three of us were present.

Q. Then, members of the Board were unanimously re-elected at that time? A. Yes, sir.

Q. How often do your directors meet? A. Our directors meet regularly quarterly and at special meetings at the call of the president.

2437

Q. How many special meetings were there in the last calendar year? A. You mean in the last twelve months or in 1939?

Q. In 1939. A. I don't know that there were any. There may have been, however.

Q. In speaking of the period of your service shortly prior to the time that you became president of the company, when

—1,186—

your predecessor was ill and was not expected to live, I believe you stated that you understood it was decided upon at 2438
that time that, in the event of the death of your predecessor, you would succeed him. By whom was it so decided upon? A. I didn't mean to state it as definitely as that.

Q. Possibly you qualified it as tentatively decided upon. A. I had many conferences with Mr. Dame who was chairman of the Board of The North American Company at that time, Mr. Gruhl, who was president of The North American Company at that time, and Mr. Fogarty, who was vice president of The North American Company at that time.

I advised them of the serious condition of Mr. Lindsay's 2439
health, and was told by them to proceed to act on behalf of Mr. Lindsay, by the management of the Company, and then, in February of that year, of the year of his death, which was 1933, Mr. Gruhl died—Mr. Gruhl, the president of The North American Company died.

Before he died, however, the matter of making me vice president of the Company, as well as secretary, had been discussed by Mr. Dame, Mr. Gruhl and Mr. Fogarty, with me, and I think the meeting at which I was elected vice president was held just after Mr. Gruhl's death, and it was held

2440 in Charlottesville, which was Mr. Lindsay's home at that time. He lived down there for a year before he died.

—1,187—

I was elected vice president and secretary at that meeting, and Mr. Lindsay, who presided as president of the Company, advised me of my election. I had been advised by the gentlemen I spoke of in New York, that that action would be taken, before that, and that, in Mr. Lindsay's absence, I would have to carry on, and that I could carry on better
2441 during the rest of his illness as a vice president than I could as secretary of the Company.

I think that probably is as far as it was assumed that I was to succeed him, but it was certainly my understanding that I was, and it eventually came about.

Q. Has Mr. Johansen ever attended a meeting of the Board of Directors, or appeared before your Board of Directors? A. I think not. We have had meetings in New York on a number of occasions, but we have always taken with us Mr. Hall, the secretary of the Company, to act as
2442 secretary at those meetings.

Q. That is to say, your Board of Directors has had meetings in New York? A. Oh, yes.

Q. At 60 Broadway? A. At 60 Broadway.

Q. What was the latest financing done by your Company prior to the recent 50 million dollar bond issue of this year.

—1,188—

A. That was in 1935.

Q. Will you describe briefly what that was, please? A. Well, in the first place, we sold 40 million 3¾ per cent. bonds

and retired a like amount of five per cent. bonds. We reorganized the capital stock of the Company and converted certain common shares into something like ten million dollars of preferred shares.

We also authorized an additional amount of 4½ per cent. preferred stock to be sold by the Company to retire the six per cent. preferred stock, which had been issued in 1923 and '24 and '25.

The bonds were sold by a syndicate headed by Dillon, Read and Company. 15 million plus were new stock 4½ 2444
per cent. preferred stock, issued by the Company, was sold by Dillon, Read and Company, and The North American Edison Company, I think, that held the stock in those days, also sold a block of the preferred stock, which came to them through the conversion through a syndicate headed by Dillon, Read & Company.

Q. North American Edison Company, since that time, has been dissolved and its assets taken over by its former parent—— A. (Interposing) That is my understanding.

Q. (Continuing) —its former parent, The North Amer-
ican Company, is that true? A. That is my understanding. 2445

—1,189—

Q. And it was at that time a subsidiary of The North American Company? A. Yes.

Q. Were you familiar with the details of the 1935 financing? A. I was very familiar with it at the time.

Q. Were they handled in a manner somewhat similar to that which you have described as being the manner in which the 1940 bond financing was handled? A. I would say that, as far as the bonds were concerned, the issuance of 40 million

2446 dollars in bonds, the same general trend of events took place, although they didn't take place at such great speed as we were forced to use in this last operation.

With respect to the preferred stock, there were two separate operations. The Illuminating Company arranged with Dillon, Read & Company to form a syndicate to sell the 15 millions of new preferred stock that we wanted to sell, The North American Company, I think, made similar arrangements to sell the stock that we were offering for sale.

2447 Q. You don't recall the approximate amount of spread in dollars, realized by the underwriters in connection with that financing? A. I think I do, with respect to ours.

—1,190—

Q. Yes. A. I think the spread was two points on the bonds and two and one-half points on the preferred stock.

Q. Which would amount to approximately how much total in dollars? A. Well, I will have to do a little figuring here. Off the record.

(Discussion off the record.)

2448 A. I think that the cost to the Company on the 40 millions of bonds was approximately $800,000.00 and on the 15 million of preferred approximately $380,000.00, making a total of something less than $1,200,000.00.

Q. In each of the instances which you have mentioned Dillon, Read & Company was the syndicate manager of the underwriters? A. That is true.

Q. And in each instance which you have cited, the attorneys representing your Company were the same? A. In each instance in these recent financing, our attorneys were the

2449

same—Sullivan and Cromwell of New York and Squire, Sanders and Dempsey of Cleveland.

Q. By "recent financing", you include all the financing you have so far mentioned? A. Yes.

Q. Reverting to your New York office, in addition to the

—1,191—

sum of approximately 20 thousand dollars paid out by your company for its portion of the maintenance of that office during the year 1939, could you state approximately how much your company paid out through that office by way of extraordinary expenditures of any character, made by that office, for which you were billed? A. Why, I wouldn't know, but I would think it would be so small as to be negligible. I can think of no item of any size at all that we so paid.

2450

Q. The North American Company does no servicing of any character for your company, for which you are billed? A. No, they do not.

Q. Who suggested the 1935 financing? A. Mr. Fogarty.

Q. I believe you said that, in connection with the 1940 bond financing which had been theretofore discussed, Mr. Fogarty some nineteen days or so before the transaction actually took place called you, suggesting that it might be a good time for that financing to take place. A. And that, if it were done, that it should be done very promptly, because of a number of reasons to which I testified, I think.

2451

Q. And you agreed with that suggestion and the matter was accomplished in that way? A. Yes.

—1,192—

2452 Q. Approximately how far is your territory from the territory of the Detroit Edison Company? By "your territory" I mean the territory served by your company. A. You mean the western boundary of our territory with the——

Q. (Interposing) Yes. A. (Continuing) ——with the nearest boundary of the Detroit Edison Company?

Q. Yes. A. I should think it might be somewhere between 120 and 140 miles.

Q. No interconnection of any character? A. There is no
2453 interconnection.

Q. The territory served by your company is not interconnected with the area serviced by any other operating company of The North American Company system? A. No, it is not.

Q. Except possibly through other systems in the middle west area? A. I think I can say——

Mr. Browning: (Interposing) Just a minute. Will you read that, please?

By Mr. Binford:

2454 Q. Except possibly through other systems in the middle west area? A. It is not interconnected in any way that I

know of.

Q. You have only one interconnection with another system, isn't that true? A. That is true.

Q. That is with the Ohio Edison Company? A. That is with the Ohio Edison Company.

Q. You don't know what the interconnections of the Ohio Edison Company are? A. No, I do not.

2455

Q. I believe you stated that the general counsel of your company lives in Cleveland. A. Yes.

Q. And is a member of your Board? A. He is a member of our Board, lives in Cleveland, and has his office in our building.

Q. Is he engaged also in the practice of law for other clients other than The Cleveland Electric Illuminating Company? A. I think not.

Q. He is employed upon an annual salary, then? A. He is employed on an annual retainer. 2456

Q. With additional compensation for extraordinary services? A. No. No additional compensation.

Q. In the case of extraordinarily large expenditures of

—1,194—

funds, such, for instance, as in the installation of a new steam generating unit, would the conclusion of a purchase be made by you without prior conference with the other members of the Executive Committee? A. No, it would not. It would originate with me through a study by myself and our staff, of the requirements. The determination—or the 2457 recommendation as to where it should be located, the size of the station, the type of equipment which would go into the station, would be determined by us, a budget addition—a budget project would be—showing the estimated cost of it—would be prepared, and that budget would be submitted by me to the other two members of the Executive Committee for approval, or, if a board meeting were to be held shortly, it would be submitted to the Board and the matter would be discussed and action taken, either by the Executive Committee or the Board, before expenditures were actually made.

2458 *Eben G. Crawford—By Respondents—Cross*

Q. You would not choose definitely from which of the three or four companies in the market to supply such equipment as I have mentioned, as to the one from which you purchase, without prior authorization from the Executive Committee or the Board? A. I would do it without formal authorization, because I would discuss with the Board and tell them what my plans were as to the equipment that would be ordered, but there would be no formal action, either by

—1,195—

2459 the Board or the Executive Committee, on the make or the type of equipment.

Q. Nor from the concern from which it is purchased? A. No. Nor the concern from which it is purchased.

Q. In other words there would be no minute of it; it would be merely an informal discussion? A. That is right.

Q. But there would be such informal discussion if the amount involved were large? A. I would say that was correct, yes, and in that connection, in discussing with the Executive Committee, I would state that I propose to buy with their approval a 60,000 kilowatt generator from the

2460 General Electric Company, and that I propose to buy sufficient boiler capacity from any one of two or three boiler firms, and in every case they have approved my judgment in the matter.

Q. From which office of your company are notices of meetings and proxy forms sent out—from the New York office? A. From Cleveland.

Q. From Cleveland? A. Yes.

Q. You mentioned the several standing inter-company committees of The North American System, including the

Station Operating Advisory Committee and certain other

—1,196—

committees. Have you ever attended a meeting of one of these committees personally? A. No, I never have, except of the executive conferences. I have never attended a meeting of the technical committees—none.

Q. How often do you have meetings of the executives of the companies? A. Well, we had a meeting June 12 and June 13, I think it was, and it was proposed that we should have another one in August. 2462

Q. That is, this year? A. This year. And the meeting was postponed because it was said that we were all too busy to have a meeting at that time, and it was deferred.

Q. When was the last one prior to this latest one? A. Well, the first one to be had was in June of this year. It followed Mr. Shea's coming into The North American Company —the first formal meeting of the executives.

Q. During your incumbency of the presidency of the Cleveland Company? A. That is right.

Mr. Binford: I have no further questions at this 2463 time and I don't anticipate having any further questions, but I should like to reserve the right to recall Mr. Crawford for further cross-examination, if it appears appropriate, later in the case.

—1,197—

Redirect Examination by Mr. Browning:

Q. Mr. Crawford, I am not sure that, in your description of individuals whose compensation you share, who have

their office in New York, you mentioned Mr. Neil as a rate expert. A. Yes.

Q. Did you mention him? A. Yes.

Q. Is he an outstanding man in that field? A. He is very outstanding.

Q. Has he devoted any substantial part of his time to The Cleveland Electric Illuminating Company in the last few years? A. Yes. He has devoted—every time that we have proposed rate reductions or rate changes, we have consulted with Mr. Neil, and in most cases he has come out to Cleveland and spent a week or a month, as the case may be, and in connection with this recent rate case and this compromise settlement Mr. Neil was in Cleveland, I should say for four or five months, continuously, lived in Cleveland, and working on the ramifications of those rate changes.

2465

Q. In order to clear the record, the 1935 financing which you were asked about on cross-examination included two

—1,198—

separate transactions which occurred at different times? A. Yes. The bond operation came first and was followed by the preferred stock operation.

2466

Q. In testifying as to the cost of these employees in New York, you said that the amount was approximately 20 thousand dollars for 1939.

In so testifying you meant that that included all expenses of any kind, did you not? A. That is right. The salaries, rent, and petty expense.

Q. Miscellaneous disbursements of any kind? A. Yes, of any kind.

2467

Q. You were asked questions regarding your counsel on the recent financing, and you named two individual lawyers, one in Sullivan and Cromwell and one in Squire, Sanders and Dempsey. Did you mean to imply that they were the only lawyers in those firms that were on that financing? A. No, I didn't mean to imply that. A number of attorneys in Sullivan and Cromwell, and at least three in Squire, Sanders and Dempsey were working day and night on that program. I don't know how many in Sullivan and Cromwell, because the work was done in New York, but I know at least three 2468
attorneys in the firm of Squire, Sanders & Dempsey that worked, worked continually on that, both in New York and Cleveland.

Mr. Browning: That is all.

(Whereupon a recess was taken.)

—1,199—

The Examiner: You may proceed.

Mr. Browning: Mr. Examiner, we request an adjournment at this time of three weeks, to September 9, at which time we will expect to proceed with the 2469
presentation of evidence regarding the Wisconsin subsidiaries.

Mr. Binford: It is my understanding that beginning September 9 counsel for Respondents will be able to present continuously the evidence they wish to present with regard to the Wisconsin subsidiaries, and that thereafter, although some recess may be requested, it will be one of less duration than that now sought before going on with the St. Louis properties.

2470

Colloquy

If that understanding is correct, I have no objection to the granting of the recess requested.

Mr. Browning: That is correct.

The Examiner: Very well, with that understanding the matter is now continued until ten o'clock a. m., September 9.

(Whereupon, at 3:35 o'clock p. m., the hearing was adjourned to reconvene on Monday, September 9, 1940, at 10:00 a. m.)

2471

2472

2473

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

2474

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1102,
Securities and Exchange Commission Building
Monday, September 9, 1940.
Washington, D. C.

2475

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

2476

PROCEEDINGS

The Examiner: The hearing will be resumed.
Mr. Hamilton: Mr. Schmidtman.

EDWARD H. SCHMIDTMAN being called as a witness on behalf of the Respondents, being first duly sworn, was examined and testified as follows:

2477 *By Mr. Hamilton:*

Q. Will you give your name to the reporter? A. Edward H. Schmidtman, S-c-h-m-i-d-t-m-a-n.

Q. And your address? A. 8283 North Gray Log Lane, Milwaukee, Wisconsin.

Q. Are you connected with Wisconsin Electric Power Company? A. I am.

Q. In what capacity? A. I am a member of the department known as the Operating Research Bureau.

Q. And for how long a period have you been connected with them? A. I have been employed by Wisconsin Electric
2478 Power Company and in that department for fourteen years.

Q. And does the Operating Research Bureau perform services for Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company in addition to Wisconsin Electric Power Company? A. Yes, it does. The department is

a branch of Wisconsin Electric Power Company but it performs services for Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company as well.

Q. Now, will you explain what the function of the Operating Research Bureau is with respect to each of the three named companies? A. The function of the department

is to make general investigations and reports on all phases of operation of the properties of the three companies.

Q. Are you familiar with the territories served by the three companies named? A. Yes, I am. I have been over the territories of all three companies on various occasions in connection with the investigations we have made.

Q. Are you familiar with the operations of the three companies and with the problems arising therefrom? A. Yes, I am. In connection with the work done by our department, I have participated in investigations of various types 2480
for all three of the companies.

Q. Is the Operating Research Bureau at all times available for service—for study, investigation and research into problems of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company? A. Yes, it is. That is, the function of the department is to serve all three of the

—1,203—

companies of the Wisconsin Michigan group rather than any one in particular.

Q. Will you now explain your professional training, Mr. Schmidtman? A. I was graduated from the University 2481
of Washington in Seattle in 1923 with the degree of Bachelor of Science in Civil Engineering. I then went to Iowa State College at Ames, Iowa, where, for three years, I served as graduate assistant and instructor in civil engineering.

During that time I completed the requirements for a master's degree in civil engineering. At the end of the first two years I had received that degree at that time. During the third year of my stay at Ames at Iowa State College, I was full time instructor in civil engineering, instructing in general civil engineering courses including hydro-electric engineering and other engineering topics.

2482 *Edward H. Schmidtman—By Respondents—Direct*

At the same time, during my third year there, I carried additional courses sufficient to complete the requirements for a Bachelor of Science in Electrical Engineering, which degree I received in the Spring of 1926.

I would like to continue that statement. I went with Wisconsin Electric Power Company in 1926. Between that time and 1931, I prepared a thesis for professional degree at Iowa State College which I received in 1931. That is the professional degree of civil engineer. My thesis was a
2483 report on an investigation of developing a water power site

—1,204—

which Wisconsin Michigan Power Company owned in upper Michigan.

Q. Are you a registered professional engineer in Wisconsin? A. Yes, I am. I originally registered as civil engineer when the law for registration of civil engineers was passed. The law was subsequently changed to include all engineers under the general classification of professional engineer so my registration was automatically changed from that of civil engineer to that of professional engineer, which
2484 my present certificate specifies.

Q. Have you participated in a state-wide power survey in Wisconsin? A. Yes, I did. In 1937, the Wisconsin Utilities Association, which is an organization of electric utility companies in Wisconsin, appointed a committee for the purpose of making a state-wide survey of all power generation and transmission facilities in the state.

That survey was made very largely in the department in which I am employed. We had assistance from engineers representing other companies, but most of the work was done in our department. I participated extensively in that work.

In 1940, the spring of this year, the report of 1937 was brought up to date—that is, to the end of 1939—and that

supplemental report was made under my direct supervision.

—1,205—

Q. Have you personally participated in conferences and negotiations with representatives of the Public Service Commission of Wisconsin with regard to regulatory matters? A. Yes, I have, on numerous occasions. I have conferred with Commission representatives on matters concerning electric rates, property accounting, service matters, inter-company agreements for services and rental of property and 2486 numerous other general topics of discussion between Commission engineers and company engineers.

Q. Now, in order that we may make clear in your testimony the names of the companies with which you are dealing, will you indicate the names of the companies comprising the so-called Wisconsin Michigan group of North American subsidiaries? A. The Wisconsin Michigan group of North American subsidiaries includes four operating companies—Wisconsin Electric Power Company, by which I am employed, Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company, these three being operating electric and gas utilities. 2487

The fourth company in the group is the Milwaukee Electric Railway and Transport Company which is a wholly owned subsidiary of Wisconsin Electric Power Company.

Q. Is that company solely a transportation subsidiary? A. Yes. The Transport Company is engaged solely in the operation of the transportation system in Milwaukee and

—1,206—

an interurban system of lines to neighboring cities.

It also operates gasoline and trolley busses in the city of Milwaukee.

Q. Was the name of the present Wisconsin Electric Power Company formerly the Milwaukee Electric Railway

2488 *Edward H. Schmidtman—By Respondents—Direct*

& Light Company? A. Yes, it was. Prior to October 21, 1938, Wisconsin Electric Power Company was known as the Milwaukee Electric Railway & Light Company.

At that time, the transportation business now conducted by the Milwaukee Electric Railway and Transport Company was conducted by the Milwaukee Electric Railway & Light Company along with the electric business.

On that date, however, the Wisconsin Electric Power Company, a former company under that name which owned
2489 a power plant that was leased to the Milwaukee Electric Railway & Light Company, was merged into the latter company and the name was changed to Wisconsin Electric Power Company and the transportation business was separated under the name of the Milwaukee Electric Railway and Transport Company.

Mr. Hamilton: May this map be marked as Respondents' Exhibit No. 32 for identification?

The Examiner: Yes.

(The map referred to was marked for identifi-
2490 cation as Respondents' Exhibit No. 32.)

—1,207—

By Mr. Hamilton:

Q. Will you explain, Mr. Schmidtman, what Respondents' Exhibit No. 32 for identification portrays? A. Exhibit No. 32 is a blueprint map showing the electric service area of the three companies of the Wisconsin Michigan group and also showing the electric production and transmission facilities employed in serving that area.

Q. Has this map been prepared under your supervision? A. It has.

2491

Q. Are the facts shown with respect to the electric systems and service areas of the respective companies taken from the records of the respective companies stated on the map? A. Yes, they were taken from those records.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 32.

Mr. Binford: No objection.

The Examiner: It may be received under that exhibit number.

2492

(The map referred to was received in evidence as Respondents' Exhibit No. 32.)

By Mr. Hamilton:

Q. Will you now explain, Mr. Schmidtman, the legend which appears in the lower right-hand corner of Exhibit No. 32? A. As indicated by the title of the map, this exhibit

—1,208—

covers the systems and electric service area of Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company.

2493

Communities in which the companies render service directly to customers—by that I mean retail service—are indicated by the open circle. The symbol constituting a circle with a cross inside, designated as communities served wholesale, indicates communities to which the companies sell electrical energy at wholesale rates for distribution by municipal distribution systems in those communities.

The circle containing the large dot in the center indicates communities within the general area covered by the map which are not served from the systems of the companies, either wholesale or retail.

The open square with the vertical bar designates a steam power plant.

2494 Q. And the ownership of those plants may be taken to be, may they not, the company in whose service area the particular symbol appears? A. Yes, that is correct. We have shown, for example, steam power plants in the vicinity of Milwaukee. There are several such plants shown there and those plants, being within the area served by Wisconsin Electric Power Company, are owned by that company.

Those are the only steam plants on the entire map. There

—1,209—

2495 is a combination steam and hydro-electric plant at Appleton, designated by a square with a horizontal and vertical bar. The hydro-electric power plants, mostly located in the northern portion of the service area of the companies, are designated by open squares containing a horizontal bar.

The open triangle represents an electric sub-station. Some of these sub-stations are classified in our property account as distribution stations.

We didn't follow the accounting classification in determining which sub-stations we should show on the map; rather, we selected the sub-stations of major importance—

2496 those above the very smallest have been shown here as an indication of the extent to which sub-stations have been provided to serve the areas.

Q. So that all sub-stations are not actually shown on the map but only the more important sub-stations? A. That is correct. The symbol representing a gas plant is an open square. Those are found at Appleton and in the territory served by Wisconsin Gas & Electric Company.

Q. And by "gas plant" you refer to a gas manufacturing plant? A. Yes, a plant where gas is manufactured. There are two kinds within the properties of these companies—the type of plant that manufactures coke gas and the type that manufactures water gas.

—1,210—

2497

Gas holders are indicated by a cross or a square with a diagonal cross in it. Points of interconnection between the systems of the three companies and between any one of the three companies and other utility systems are shown by two short parallel lines drawn across the transmission line at the point of interconnection.

Where the interconnections are between the properties of two of the companies of the group, the change in ownership is designated by the color of the lines which I will explain in a moment.

2498

Where the interconnection is between one of the companies of the group and some non-affiliated electric utility, such as Wisconsin Power & Light Company, shown near the bottom of the map in Walworth and Rock Counties, the map will indicate the name of the non-affiliated utility with which the interconnection exists.

The ownership of the electric power lines is shown by coloring, the lines of Wisconsin Electric Power Company being colored red, those of Wisconsin Gas & Electric Company being colored yellow and those of Wisconsin Michigan Power Company being left in white.

2499

Q. Will you explain now the basis which has been adopted in showing electric power lines? In other words, above what voltage have you taken lines? A. As in the case of the substations, we have shown on this map the principal lines of

the company with the thought that we wanted the map to picture the extent to which these principal lines cover the territories served by the companies. We didn't follow a voltage designation strictly, although I can say that all lines of 132,000 volts, 66,000 volts, and 33,000 volts are shown on the map.

Some of the 26,400 volt lines owned by the companies are shown, some of the 13,800 volt lines are shown, and in a few instances where communities are served by lines of voltage below 13,800, we have shown lines that operate at primary voltage of 4,800 volts.

Q. No lines are shown of less than 4,800 volts? A. No.

Q. Can you state the basis for exclusion or inclusion of lines shown between 4,800 volts and 33,000 volts? A. Do you mean—yes, I can state that. Those lines below 33,000 volts which are classified as transmission in our classification of property, are all shown.

Q. I see. A. And some lines below 33,000 volts—that is, those which are in the distribution class—are shown because they take service to communities which we felt were important enough to show on the map. That is, we didn't think it would be very informative to show a community served without a line connecting to it.

—1,212—

Q. So that if you added to the map any lines which may exist of less than 4,800 volts, and distribution lines in excess of 4,800 and up to 33,000 volts, you would have a substantial number of lines in addition to those shown, is that right? A. Yes, we would have so many lines that I doubt that there would be room on the map to put them all on in the more heavily served areas.

The gas properties of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company are shown by the symbols indicated in the legend. The gas transmission lines are represented by short dashes, those of Wisconsin Gas & Electric Company being colored yellow and those of Wisconsin Michigan Power Company being left in white.

Q. Are all gas transmission lines shown? A. Yes, all of them owned by either or both of these two companies are

2503

shown. The electric service areas as indicated by the legend are shown by the diagonal lines or crosshatching. The symbol indicates which company serves each area.

Q. Will you now show us on Exhibit No. 32 the course of the Michigan and Illinois State lines? A. Yes. The Wisconsin-Illinois State line lies along the bottom of the map and it terminates the territory of Wisconsin Gas & Electric Company in Kenosha County.

—1,213—

2504

The Wisconsin-Michigan boundary line enters the map near the upper left corner. It is the heavy dash and dot line which is straight for a section and then it becomes rather twisting. This curved portion of the boundary line represents the Brule River and the Menominee River, the lower section being the Menominee River which flows into Green Bay.

There is one point just above the final "N" in the word Wisconsin, where the word Menominee appears. The draftsman shifted that word a little too far to the left where the name Menominee appears.

2505

The word Menominee County is in Michigan and that word should be entirely on the right-hand side of the river.

Q. Before going into any detailed description of the respective service areas, would you give us a general description so that it may be clear, particularly where service areas are adjacent, which company serves the particular territory? A. The combined territories of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company occupy an area of 4029 square miles in the southeastern portion of the State of Wisconsin. This area includes the principal industrial districts of the State and also includes what might be termed one of the richest portions of the agricultural sections in the State of Wisconsin.

As can be seen from the map, the general shape of the

—1,214—

combined territories of these two companies is that of a rough semi-circle with its diameter lying along the west shore of Lake Michigan. The territory begins on the south at the Illinois boundary line and extends north about ninety miles along the shore of the lake.

The most westerly point is about sixty miles west from Lake Michigan at Milwaukee. This area includes the prin-
2507 cipal cities of Milwaukee, Racine, and Kenosha, which are the industrial centers of the entire district.

The other portions of the service area of these three companies are served by Wisconsin Michigan Power Company. One of them referred to as the southern division of that company lies in the vicinity of Appleton.

It extends about ten miles south, from Appleton along both shores of Lake Winnebago, west about forty miles, north about fifty, and east about ten miles from Appleton. This division includes a highly industrialized section of the
2508 lower Fox River Valley near Appleton, and a rich agricultural area lying to the north and to the west.

The northern portion of the service area of Wisconsin Michigan Power Company is located in northeastern Wisconsin and the upper peninsula of Michigan. It lies roughly parallel to the Wisconsin-Michigan boundary line extending for a length of approximately 120 miles in an easterly and westerly direction and has an average width of about sixty miles.

—1,215—

The lines surrounding the territory are quite irregular but those are the approximate mean dimensions. This northern portion of the territory includes the City of Iron Moun-

2509

tain, Michigan, and the cities of Crystal Falls and Iron River.

Q. You might locate those cities on the map. A. Iron Mountain is located in the vicinity of the name of Dickinson County at about the south central portion of the northern territory.

Crystal Falls is northwest from there, diagonally northwest, and is identified by a symbol indicating a community served wholesale.

2510

Iron River is due west from Crystal Falls. At that point we find a symbol indicating a Diesel engine generating station. At Iron River the system of Wisconsin Michigan Power Company interconnects with that of Iron Range Light & Power Company.

The northern territory includes, in addition to these cities, a fairly active—in fact, a very active at present—iron mining district in the vicinity of Iron Mountain, Crystal Falls and Iron River.

The northern territory also includes portions of Schoolcraft and Delta Counties located on the eastern end of the Michigan area.

2511

The business done in that district is a small portion of the total business of the company inasmuch as the company serves only about 315 customers in that district who, in

1939, consumed 228,000 kilowatt hours from which the company received gross revenue of about $12,500.00.

The company operates another short section of line which is detached from the main system of the company. This section is located in Marquette County and will be found on the map above the letter "A" in the word "Michigan".

Energy distributed on this line is purchased from Cliffs Power & Light Company, as is the energy distributed on the line in Schoolcraft County.

Q. Cliffs Power & Light Company is a non-affiliated company? A. Yes, it is non-affiliated.

Wisconsin Michigan Power Company serves 470 customers from this short section of line in Marquette County, who, in 1939, purchased 370,000 kilowatt hours for which they paid a gross revenue of $17,600.00.

2513 The combined sales on these two short sections of detached line in 1939 amounted to three-tenths of one per cent. of the total kilowatt hours sold by Wisconsin Michigan Power Company and produced revenues amounting to nine-tenths of one per cent. of the total revenue of the company.

Q. That again is a gross revenue figure, is it? A. Gross revenue, yes, and per cent. of the gross revenue.

Q. What is the population density of the territory of the three companies? A. The population density of the terri-

tories served by the three companies varies rather widely.

2514 Wisconsin Electric Power Company renders service in an area covering 867 square miles. In that area, the company serves a population of 873,500. The average density of that population in that area is slightly over 1,000 per square mile.

Wisconsin Gas & Electric Company, which serves the territory immediately adjacent to and completely surrounding the territory served by Wisconsin Electric Power Company, serves a population of 231,818. The area is 3,162 square miles and the average density of population is approximately 73 per square mile.

Wisconsin Michigan Power Company serves a population of 104,300 in the southern portion of its territory which has an area—correction—in the Wisconsin portion of its terri-

2515

tory including the section around Appleton as well as the area served in northern Wisconsin.

The Witness: Will you read my answer to me, please?

(Whereupon the answer above recorded was read by the reporter.)

The Witness: This territory has an area of 2,508 square miles.

By Mr. Hamilton:

2516

Q. That being the entire territory served by Wisconsin Michigan Power Company in Wisconsin? A. Yes, that is —1,218— what it is. That is the entire Wisconsin territory of Wisconsin Michigan Power Company.

Q. In Wisconsin. A. The density of population in that area is approximately 42 per square mile.

The Michigan territory served by Wisconsin Michigan Power Company covers an area of 5,781 square miles in which the company serves a population of 65,500. This gives an average population density of only 11 per square mile. The total territory served by Wisconsin Michigan Power Company in both Wisconsin and Michigan has an area of 8,289 square miles and in that area the company serves a population of 169,800.

2517

These figures show that the average population density of all territories served by Wisconsin Michigan Power Company in both states is only 20 per square mile which is a relatively low population saturation.

Now, summarizing for the three systems as a whole, we find that the companies are serving a population of 1,275,000 in a total area of 12,318 square miles, giving an average density of population of 104 per square mile.

2518 Q. What is the relation of the territories served by the companies to the entire square mileage of Wisconsin? A. The companies serve a total of 6,537 square miles in Wisconsin alone. The area of Wisconsin is 55,256 square miles.

—1,219—

That would indicate that the companies are serving somewhere in the neighborhood of 12 per cent. of the total area of the State of Wisconsin.

The population served in that area is 1,209,600. The
2519 1940 population of Wisconsin was reported to be 3,125,000. From these figures we can see that the companies are serving slightly less than 40 per cent. of the total population of Wisconsin.

Q. Mr. Schmidtman, in indicating the population served, you are not purporting to indicate the number of customers served but rather the total number of persons residing in the territory indicated, isn't that true? A. No, not exactly. When I state "population served" I mean the population of the areas including communities in which the companies render electric service.

2520 To elaborate a little, the territory of Wisconsin Gas & Electric Company includes the Village of Slinger, which can be found on the map to the right and slightly below the name of Dodge County. It is indicated by a circle containing a cross which means the company sells energy wholesale to that community.

The population of that community is not included in the figures I have given as population served by the company because that population is served by the municipal utility which operates in that municipality.

—1,220—

In the case of Hartford, which is located to the left and slightly below Slinger, the company likewise does not render

service in that area and so the population of that area has not been included in our figures.

With respect to the distinction between population and customers, however, the answer to your question is yes. These figures do not indicate the number of customers on our systems. They indicate simply the number of people residing in the areas where the three companies of the Wisconsin-Michigan group actually render service.

Does that answer the question suitably?

Q. Yes. These figures again are solely for electric service, 2522
are they not? A. Yes.

Q. They don't purport to take in gas? A. They apply to electric service only.

Q. How many communities are served by the three companies? A. The three companies render electric service in a total of 388 communities in the states of Wisconsin and Michigan.

Q. And how is that figure divided between the companies? A. Wisconsin Electric Power Company renders electric service in 64 communities. These 64 comprise seven cities, nine- 2523
teen villages, and thirty-eight townships which are unincor-

porated.

Wisconsin Gas & Electric Company renders electric service in a total of 170 communities, including seven cities, forty villages, and 123 townships.

Wisconsin Michigan Power Company renders electric service in 94 communities in Wisconsin and 60 communities in Michigan. The Wisconsin communities include three cities, fourteen villages, and 77 townships, while the Michigan communities served include three cities, six villages and fifty-one townships.

The make-up of the total of 154 communities served by Wisconsin Michigan Power Company is six cities, twenty villages and 128 townships

The three companies together serve electric customers in twenty cities, 79 villages and 289 townships, making the total of 388 I gave you before.

Q. These communities to which you have referred are located in how many counties? A. They are located in a total of thirty-seven counties, of which twenty-six are in
2525 Wisconsin and eleven are in Michigan.

Among the more important counties included in the service area of the three companies are Milwaukee, Racine, Kenosha, and Waukesha Counties, in Wisconsin, which are the more heavily populated counties in the combined territories of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company and Outagamie County, Wisconsin,

—1,222—

and Dickinson and Iron Counties, Michigan, which are served by Wisconsin Michigan Power Company.

2526 Other counties in which the population is not so heavy but in which substantial service is rendered are Ozaukee, Washington, Jefferson and Walworth in Wisconsin, and Waupaca and Oconto Counties, also in Wisconsin. The other counties served in Michigan are not heavily populated.

(Discussion off the record.)

By Mr. Hamilton:

Q. In order to get an idea as to the relative importance of the communities served population-wise, would you indicate the communities served by Wisconsin Michigan Power Company having a population of an excess of 2000 persons? A. Of the twenty-six incorporated communities—that is,

2527

cities and villages—served by Wisconsin Michigan Power Company in Wisconsin and Michigan, six have a population of 2000 or more. Of these six, four are cities and two are villages.

The largest of these is the City of Appleton, Wisconsin, in which the—in and around which the principal industrial business of Wisconsin Michigan Power Company is conducted.

Q. What is the population of Appleton? A. The population of Appleton is 28,458. Appleton is the principal city 2528

—1,223—

served by Wisconsin Michigan Power Company. It is a residential city and is also the center of a very active industrial area in the Fox River Valley.

Lawrence College and the Institute of Paper Chemistry are located there. The Institute of Paper Chemistry is a research institution endowed by the paper industry. It is not conducted as an educational institution for the public, but is sort of a research foundation in which new processes and new products related to the paper-making industry are developed. Some of the finest paper chemists in the country 2529 have had their training and are improving their training in this institute.

Among the industries in and around Appleton, the principal ones are paper mills and other industries related to the manufacture of paper and paper products. Other factories in the area produce knit goods, among which are goods for personal wear as well as the knitting of wool blankets which are used in the manufacture of paper.

It is a very precise operation; a very high-grade product is required to serve this use.

Other industries in Appleton produce agricultural implements, toys and various products of wooden ware.

2530 There is a brewery located at Appleton and also a large milk condensery.

Appleton is a natural industrial center for this section

—1,224—

of the state because of the presence of available water power in the Fox River. The early industries which settled in Appleton utilized this water power entirely for their manufacturing operations—that is, for their power requirements —and many of those industries still make extensive use of

2531 the water power in the Fox River, but industrial loads in the area in general have far outgrown the amount of power available from the River, and so many of the industries—most of them, in fact—purchase substantial quantities of power from Wisconsin Michigan Power Company.

The next largest city served by Wisconsin Michigan Power Company is Neenah—N-e-e-n-a-h—which is located on the shore of Lake Winnebago a few mlies south and west of Appleton.

Neenah has a population of 10,642. This city is located at the point where the Fox River flows from Lake Winnebago

2532 and, as was the case in Appleton, Neenah also has fairly large amounts of water power available from the Fox River. The United States Government owns and operates a dam across the Fox River at Neenah which is operated for the purpose of regulating the discharge from Lake Winnebago in using it as a storage reservoir to maintain navigable flows of water in the Fox River.

The Fox River is a navigable stream and considerable shipping is done on it from Green Bay up into Lake Winnebago and to the cities located on Lake Winnebago.

—1,225—

The principal industries in Neenah also relate to the manufacture of paper and various paper products.

2533

Iron Mountain, Michigan is the principal city served by Wisconsin Michigan Power Company in the State of Michigan. It has a population of 11,500. It is located in the Menominee iron range.

I spoke a while ago of the iron mining activities in the portion of the Michigan territory lying along the Wisconsin boundary. On of the active areas in this iron range is in the immediate vicinity of Iron Mountain.

The other industries in Iron Mountain are saw mills and smaller industries producing wood products.

2534

Kingsford, Michigan, is a village which is largely a residential suburb of Iron Mountain and is located immediately at the south limits of Iron Mountain. Kingsford has not been shown on the map. We regard Kingsford and Iron Mountain in an operating sense as one combined community, but in discussing them, for the purposes of desc ibing the territory served, we have taken it up separately in order to tell of its characteristics.

Kingsford has a population of 6500. Its only major industry is a saw mill and a plant of the Ford Motor Company where station wagon bodies are made. These bodies are made of wood and the plant is located here to utilize the wood available in the surrounding territory.

2535

—1,226—

The next larger community served by Wisconsin Michigan Power Company is Kimberly, Wisconsin, which is located on the Fox River, a few miles downstream from Appleton. It appears on the map.

Kimberly has a population of 2700. It is a residential suburb of Appleton. A large paper mill of the Kimberly-Clark Corporation is located in Kimberly, utilizing the water power from the Fox River in carrying on its paper manufacturing operations.

2536 *Edward H. Schmidtman—By Respondents—Direct*

Large quantities of wood are ground into pulp at this plant and the plant produces papers of various quality. The Kimberly-Clark Corporation has generally specialized in the manufacture of high quality papers—bond and paper for accounting forms, and paper used in the rotogravure sections of the Sunday newspapers. They are a very progressive corporation and one of the largest customers of Wisconsin Michigan Power Company.

Mr. Hamilton: Off the record.

2537

(Discussion off the record.)

The Witness: Niagara, Wisconsin, a village of 2100 population, is served by Wisconsin Michigan Power Company. Niagara is located just south of the Michigan boundary and can be found on the map by following the high voltage transmission line vertically to the point where it strikes the Michigan boundary,

—1,227—

then immediately to the left you will find Niagara.

It is indicated as a community served by the company and also is a point of interconnection between the system of Wisconsin Michigan Power Company and a plant of Kimberly-Clark Company.

2538

Niagara is largely a residential community, but has the one principal industry—the Kimberly-Clark Paper Mill. The mill is constructed at Little Quinnesec Falls—Q-u-i-n-n-e-s-e-c—on the Menominee River.

That is one of the major falls in the stream and is a site of substantial water power capacity. The Kimberly-Clark mill utilizes the power in the river at that point in operating its mill, and as will be pointed out later, the interconnection with Wisconsin Michigan

Power Company permits it to dispose of surplus energy from the plant and to obtain firm power during periods of deficiency in their own source.

By Mr. Hamilton:

Q. Does Wisconsin Michigan Power Company serve a large rural area as well? A. It does, yes. The area surrounding Appleton and reaching to the north and the west is very largely rural. The communities located within that area are relatively small and the principal activity as well 2540
as the principal income of the district relate to agricultural pursuits.

—1,228—

This area produces large numbers of hogs and in that connection the farmers raise large crops of grain and also have dairy herds, produce dairy products, and various products related to dairying, largely for feed.

There is some truck farming also in the immediate vicinity of Appelton to the north and somewhat to the west. Various vegetables that thrive on relatively short seasons are produced there in great quantities. 2541

In the northern portion of the territory of Wisconsin Michigan Power Company lying in northern Wisconsin and in Michigan, there are large rural areas lying between the scattered urban centers. In these rural areas are wide stretches of forest land, the best timber having been removed during the years of the logging boom in Wisconsin and Michigan, and the timber now standing being made up now largely of second growth soft wood, poplar and basswood, quick growing soft-wood trees of that general character.

Some of the area in that district is still covered with original stands of hardwood—hickory, maple and oak.

Q. Does Wisconsin Michigan Power Company serve all the incorporated communities within its territory? A. Yes, it does. It does with the exception of those served by municipal utilities. By that I mean aside from the municipal utilities there are no incorporated communities served within the territory. —1,229—

Now, those municipal electric systems are operated in eight municipalities. Menasha, which is located immediately across the river from Neenah on Lake Winnebago right at the
2543 northern tip of Lake Winnebago, operates one of these municipal electric utilities.

The Menasha system serves about 3,100 electric customers. Menasha has a population of 10,900. The energy which is distributed on the Menasha municipal system is generated very largely in an internal combustion generating station operated by the city.

That station has a capacity of 2,500 kilowatts. The plant is of insufficient capacity, however, to carry all of the loads served by the municipal utility, and it has been necessary from time to time for the city to purchase supplemental
2544 power from Wisconsin Michigan Power Company to make up for the deficiency in its own plant.

That is, the load has grown beyond the ability of the plant to carry it and the municipal system is connected with that of Wisconsin Michigan Power Company.

—1,230—

The plant, being of limited capacity, is also unable to serve all of the industrial loads within the city and for that reason for a number of years Wisconsin Michigan Power Company has served all of the large industrial power loads located within the city, in addition to supplying supplemental energy to the municipal system for distribution to its customers.

During the year 1939 Wisconsin Michigan Power Company delivered 2,913,600 k. w. h. of electrical energy to the municipal sysem. That isn't a very large quantity of energy but it is always taken at a time when the municipal plant is in need of additional capacity and is considered firm energy of the highest type.

By Mr. Hamilton:

Q. That figure is exclusive of sales which you make direct to large industrial users in the city? A. Yes, that is true. 2546

Another municipality in this district is operated by the city of Kaukauna. Kaukauna is also located on the Fox River, but is downstream from Appleton. It appears in the open space on the map, immediately to the right of Appleton. It is indicated by a symbol which shows that energy is sold to the city by Wisconsin Michigan Power Company at wholesale.

There is also a symbol showing an interconnection between the electric system of Wisconsin Michigan Power Company and the electric system operated by the city of Kaukauna. 2547

—1,231—

Q. And what is the population of Kaukauna? A. Kaukauna has a population of 7,200 and the municipal utility renders service to approximately 3,100 customers.

Kaukauna operates two hydroelectric stations on the Fox River. At this point I think I should explain that the United States Government operates navigation dams on the Fox River for the purpose of maintaining navigable depths of water in the river and in canals paralleling the river between the dams and locks. There is more than enough water flowing in the stream under normal stream flow conditions to furnish the needs for these navigation purposes and the right

to utilize the power at the Government dams represented by that excess flow is owned by Green Bay and Mississippi Canal Company, which, through a long history, came into the ownership of this water right, that is the right to use the power in flowing water.

Green Bay and Mississippi Canal Company does not own nor operate any water power plants on the river but it leases the water power at the various navigation dams to different users. The city of Kaukauna operates two water power
2549 plants at two of such dams; one is known as the Badger plant, located in the city of Kaukauna, at the Kaukauna dam, and the other is located a short distance downstream, at the Rapide Croche dam.

The city operates the two power plants, paying Green Bay and Mississippi Canal Company annual tolls for the use of the falling water, and uses the output from these plants in operating its municipal electric utility. The two plants pro-

duce more energy at certain seasons of the year than the municipal system is able to utilize in serving its customers,
2550 that is during seasons of average flow and of high flow when the generating units in the plants have enough water to operate at full load they produce more energy than municipal utility requires for its customers.

During those periods, by means of the interconnection with Wisconsin Michigan Power Company, Kaukauna delivers that excess energy into the system of the company. That energy is what we call surplus or dump hydroelectric energy. We call it that because it comes only at the times when streams are in flood, or at the times when the loads on the municipal distribution systems are below the output of the plants.

2551

During other seasons of the year, however, when the stream drops to low flow conditions, the plants do not put out enough energy to carry the needs of the municipal distribution system. At those times the city of Kaukauna purchases energy from Wisconsin Michigan Power Company to make up its own deficiency of supply.

In 1939 the city of Kaukauna sold to Wisconsin Michigan Power Company 4,089,800 k. w. h., and purchased from the company 2,709,000 k. w. h. Kaukauna has several industries, most of which are paper mills or other industries related to 2552
the manufacture of paper products.

Shawano, Wisconsin, located on the eastern edge of Shawano county, in the northwest portion of the southern

—1,233—

area served by Wisconsin Michigan Power Company, also operates a municipal electric distribution system. Do you find it?

Shawano has a population of 4,800. The electric distribution system operated by the city does not include any power generation facilities whatever, all of the power requirements of the system being purchased from Wisconsin Michigan 2553
Power Company.

In 1939 the municipal electric system purchased 3,796,693 k. w. h. from Wisconsin Michigan Power Company for distribution to about 1,700 customers. Shawano is a trading center for a large rural area devoted principally to dairying and products related to the dairying industry. The area served by Shawano in that respect, lies partly within the territory served by Wisconsin Michigan Power Company and partly outside the territory of the company. The industries located in Shawano consist principally of condensed milk canneries and other milk processing plants.

New London, Wisconsin, which is located in Waupaca county, southwest from Shawano, also operates a municipal electric distribution system. As is the case with Shawano, New London purchases all of its energy requirements from Wisconsin Michigan Power Company and does not operate any power generation facilities. It never has operated any power plant.

The New London system serves about 1,200 customers and in serving those customers it purchased from Wisconsin
2555 Michigan Power Company in 1939, 4,791,966 k. w. h. New

London is largely a residential community in an agricultural area much like Shawano. Its principal industries are a vegetable cannery and a milk condensery. You will notice that in the case of most of these communities in the southern portion of the area served by Wisconsin Michigan Power Company the industries are related to agricultural products showing the agricultural nature of the general area.

Oconto Falls, Wisconsin, which is located in Oconto county about 20 miles west of Green Bay, operates a munici-
2556 pal electric distribution system. This system sells about 400,000 k. w. h. annually to approximately 500 customers. It operates no power generation facilities, purchasing all of its energy requirements from Wisconsin Michigan Power Company. The principal industry at Oconto Falls is a pulp mill, the power loads of which are served directly by Wisconsin Michigan Power Company.

This pulp mill is located on the Oconto River, on which is also located the Oconto Falls hydroelectric plant of Wisconsin Michigan Power Company, indicated by the hydroelectric power plant symbol shown on the map. The pulp mill uses water power from the Oconto River in grinding pulp to the extent that such power is adequate to meet its

2557

needs and power requirements above that are purchased from Wisconsin Michigan Power Company.

The city of Norway, Michigan, located in the open space in the territory served by Wisconsin Michigan Power Company, east of Iron Mountain and lying north of and adjacent

—1,235—

to the Wisconsin-Michigan boundary line, operates an electric distribution system. This system serves approximately 1,200 customers and purchases all of the energy distributed to these customers from Wisconsin Michigan Power Company through the interconnection indicated on the map.

2558

In 1939 Wisconsin Michigan Power Company sold the city of Norway 1,528,674 k. w. h. for distribution on the municipal system.

Q. And its population is what? A. The population of Norway is 3,500. Norway is largely a residential community, to some extent a suburb of Iron Mountain, and is situated in the iron mining district on the southeastern end of the Menominee iron range.

Crystal Falls, Michigan, operates a municipal hydroelectric generating station and distribution system. This city is located in Iron county east of Iron River, in the area not served by Wisconsin Michigan Power Company.

2559

The city of Crystal Falls generates most of its energy requirements for the distribution system by means of the hydroelectric plant which it operates on the Paint River flowing through the city. Here, again, however, there are times when the plan is capable of generating power faster than the customers of the system need it. During such times the city delivers that surplus energy to the system of Wisconsin Michigan Power Company as dump hydroelectric energy. Likewise there are seasons when the Paint River flow falls

—1,236—

to such a point that there is not sufficient water in the stream to carry the loads of the municipal system and at those times the city buys make-up power from Wisconsin Michigan Power Company.

In 1939 the city sold 595,200 k. w. h. of surplus hydro-electric energy to Wisconsin Michigan Power Company, and purchased 11,400 k.w.h. of firm energy from the company. This exchange of energy is not extensive as indicated by the figures, but it is quite important to the municipal utility to
2561 be able to dispose of the surplus output because if it had no market that power would be wasted in the form of water spilled over the dam and it is likewise important, even more so, to the municipality to be able to purchase firm power during its times of need.

Q. What is the population of Crystal Falls? A. Crystal Falls has a population of 2,600, and the municipal system there serves approximately 900 customers.

Crystal Falls has no major industries within the corporate limits but it lies in the center of a very active section of the iron mining district in the Menominee range. A num-
2562 ber of large scale iron mines operate in the immediate vicinity of Crystal Falls. These mines, however, are outside the area reached by the municipal utility and are served entirely by Wisconsin Michigan Power Company.

The Examiner: Let us have a recess for five minutes.

(Whereupon, after a brief recess the hearing was resumed.)

The Examiner: All right.

Edward H. Schmidtman—By Respondent—Direct 2563

By Mr. Hamilton:

Q. Proceed. A. There is one other electric utility operated by a public body within the territory served by Wisconsin Michigan Power Company. That is the utility operated by the Florence Water and Light Commission, of the Township of Florence. The presence of the system which is served wholesale by Wisconsin Michigan Power Company is designated by the symbol indicating wholesale service at Florence, which is located in Wisconsin, south and a trifle east of Crystal Falls. 2564

The community of Florence is unincorporated but electric service is rendered in that community and in the neighboring community of Commonwealth by the electric distribution system which is operated by the Township Board of the Township of Florence. This system serves approximately 300 customers, all of the energy distributed being purchased from Wisconsin Michigan Power Company through the interconnection shown on the map.

In 1939 the Florence Water and Light Commission purchased 465,100 k. w. h. from Wisconsin Michigan Power Company for distribution to its customers. The community 2565 of Florence has a population of 1100. It is located in the general area lying between Iron Mountain and Crystal Falls, and some iron mines operate in the general vicinity. It is a small residential community with no industries directly

—1,238—

inside the community area.

Q. Turning now to Wisconsin Gas & Electric Company, what cities are served with electric service by it in its territory? A. Wisconsin Gas & Electric Company renders electric service in seven cities. The principal city served by the company is Kenosha, which has a population of

48,464. Kenosha is an important city in the industrial area of Wisconsin. It is located seven miles north of the Illinois line and is on the shore of Lake Michigan.

The principal industries operating in Kenosha and served by Wisconsin Gas & Electric Company, are the Nash Kelvinator Corporation which manufactures Nash automobiles in Kenosha; the American Brass Company, which manufactures a large variety of brass and copper products; the MacWhite Company, which manufactures MacWhite wire rope;
2567 the Simmons Manufacturing Company, which produces bed springs and mattresses; Coopers' Incorporated, manufacturing various knit goods; Kenosha Full Fashioned Mills, which also make knit goods; and the Peter Piersch & Company, widely known manufacturers of fire-fighting equipment.

Waukesha, Wisconsin, is also served by Wisconsin Gas & Electric Company. It is located about 14 miles west of Milwaukee, entirely within the area served by Wisconsin Electric Power Company. The territory served in that district by Wisconsin Gas & Electric Company is indicated by
2568 the line enclosing the area cross-hatched with the symbol indicating service area of Wisconsin Gas & Electric Com-

—1,239—

pany.

Waukesha has a population of 19,205. It is a residential and industrial community. Its principal industries include the Waukesha Motor Company which manufactures gasoline engines; the Foxhead Waukesha Corporation, which manufactures beer, soft drinks and bottles and distributes mineral water; the Borden Milk Products Company, which produces various milk products; the Crittal-Federal, Inc., who produce steel sash and other steel products for building construction.

2569

Waukesha is also known for its sanitariums and mud baths. Large quantities of limestone, sand and gravel are produced there. All of these industries, as well as others which I haven't mentioned, are served directly as customers of Wisconsin Gas & Electric Company.

The city of Watertown, with a population of 11,270, is served by Wisconsin Gas & Electric Company. Watertown is located directly on the county line between Dodge and Jefferson counties, and about midway east and west between the extremes of Dodge county. It is 45 miles north and

2570

west of Milwaukee.

Watertown is largely residential in nature but has a few industries, among which are the Village Blacksmith Folks, manufacturers of a well-known line of cutlery; the Walter Booth Shoe Company is located there, as well as three large dairies and several manufacturers of wood specialties.

Fort Atkinson, which is situated in the southern portion

—1,240—

of Jefferson county, has a population of 6,140. Electric service is rendered there by Wisconsin Gas & Electric Company. In addition to being a residential center for a large

2571

agricultural area, Fort Atkinson has several dairy products plants which produce cheese and butter. It also has a knitting mill and two plants which manufacture various types of farm equipment.

West Bend is also served by Wisconsin Gas & Electric Company. It is located due west from Port Washington which is on the shore of the lake, 25 miles north of Milwaukee.

West Bend and its suburb, the village of Barton, constitute a very active industrial and residential community.

2572 *Edward H. Schmidtman—By Respondents—Direct*

The Amity Leather Company, manufacturers of a wide line of leather goods; the Enger-Kress Company, which also manufactures leather goods; and the West Bend Aluminum Company, are located in West Bend. Other industries in West Bend and Barton which are usually considered as one center, include brewing and malting, stone quarrying, the manufacture of knit goods, automobile accessories, electrical equipment, laundry equipment, and dairy products.

Q. Have you given the population of West Bend? A.
2573 The population of West Bend is 5,456.

Wisconsin Gas & Electric Company also renders electric service in the city of Burlington which is located in the southwest corner of Racine county. Burlington has a population of 4,111. It is principally a residential community, surrounded by an agricultural and summer resort area. Its principal industries include a brewery, a brass foundry, and

an ice cream factory. A considerable amount of business is done in Burlington by people who go to that area to visit the resorts on the lakes. Because of that fact the electrical
2574 sales in Burlington do not show the usual seasonal decline in summer that is shown by sales in many communities.

Whitewater, which is located in the northwest corner of Walworth county, has a population of 3,679. It is a residential community which serves as a trading area for a rural district surrounding it. Its major industries are a brewery and a dairy products plant.

Q. Are there municipal electric utilities located in the territory served by Wisconsin Gas & Electric Company? A. Yes, there are. There are nine such municipal electric utilities within the territory served by Wisconsin Gas &

2575

Electric Company. Of these nine, six of them purchase their total energy requirements from Wisconsin Gas & Electric Company and three generate power. Of those which purchase their entire requirements from Wisconsin Gas & Electric Company, Elkhorn is one.

Elkhorn is located at about the center of Walworth county. As indicated by the map, its system is interconnected with that of Wisconsin Gas & Electric Company and power is sold at wholesale to the city for distribution to its customers. The municipal system operated by the city of 2576
Elkhorn serves approximately 1,000 customers and in 1939 the city purchased 3,086,400 k. w. h. from the company in

—1,242—

serving those customers.

Elkhorn is also located in the same general resort area in which Burlington is situated and has a considerable residential population. Its industries are generally associated with dairying, a large plant of United Milk Products being located there.

Q. What is the population? A. The population of Elkhorn is 2,700. 2577

Another city operating a municipal utility, located within the territory of Wisconsin Gas & Electric Company, is the one at Jefferson, Wisconsin. Jefferson has a population of 2,700. The municipal utility operated by the city of Jefferson purchases its entire power requirements from Wisconsin Gas & Electric Company, taking 3,256,320 k. w. h. from the company in 1939. This energy was distributed to about 1,100 customers.

The community is largely residential but has one major industry which is a plant of the Copeland Ryder Shoe Company.

2578 *Edward H. Schmidtman—By Respondents—Direct*

I did not locate Jefferson for you on the map. It is in Jefferson county, slightly west of the center of the county.

A municipal utility is operated by the village of Kiel, Wisconsin, which is located at the northern edge of the territory served by Wisconsin Gas & Electric Company. The village is shown on the map at the line between Manitowoc and Calumet counties, near the southwest corner of Manitowoc county.

Kiel has a population of 2,000. The municipal distribu-
2579 tion system serves approximately 800 customers and in 1939 it purchased 1,295,200 kilowatt hours from Wisconsin Gas

—1,243—

& Electric Company for distribution to its customers.

The principal industry located in Kiel is the factory of the Kiel Furniture Company. The village of Kiel is not located strictly within the confines of the territory served by Wisconsin Gas & Electric Company, but we have shown it as one of the communities to which the company renders electric service at wholesale.

The village of Deerfield, Wisconsin, is located in the west-
2580 ern tip of the territory of Wisconsin Gas & Electric Company, in Dane County. It has a population of about 400. It is a residential village with vegetable canning plants located in the country-side around the village.

The municipal distribution system operating there serves about 200 customers and its entire power requirements, which were purchased from Wisconsin Gas & Electric Company in 1939, amounted to 887,000 kilowatt hours.

The Village of Slinger, with a population of 800, also purchases energy from Wisconsin Gas & Electric Company for distribution on a municipal electric system.

Slinger is located near the center of Washington County. The municipal system of the village serves about 200 customers and purchased 689,760 kilowatt hours from Wisconsin Gas & Electric Company for distribution in 1939.

(Discussion off the record.)

—1,244—

The Examiner: Back on the record

Mr. Hamilton: Will you read the last statement by the witness?

(Whereupon the last above statement was read by the reporter.)

The Witness: There are no industries worthy of note in the village of Slinger, but the village derives its principal business from the resort area in which it lies.

Wisconsin Gas & Electric Company sells electrical energy at wholesale to the municipal utility operated by Waterloo, Wisconsin. Waterloo has a population of 1300 and is located in the northwest corner of Jefferson County. The municipal system in that community serves approximately 500 customers, and in 1939 it purchased 1,848,938 kilowatt hours from Wisconsin Gas & Electric Company.

The municipal utility purchases its entire energy requirements from the company. Waterloo is a residential community deriving some business from the surrounding agricultural and resort district.

Three of the municipal electric utilities operating within the territory served by Wisconsin Gas & Electric Company generate their own power.

2584 *Colloquy*

One of these is that at Cedarburg, which appears on the map south and west from Port Washington. It is designated by a symbol which indicates a community not served from the system of any of the companies.

—1,245—

Cedarburg has a population of 2300. The municipal utility there operates a Diesel engine generating station which has an installed capacity of 1500 kilo-
2585 watts. It serves approximately 760 customers and the annual sales amount to about 1,500,000 kilowatt hours.

Cedarburg is located in a rich agricultural area north of Milwaukee, which produces fruits, grains, garden truck and dairy products.

Several mink and fox farms are located near the city, the principal ones being those of Fromm Brothers, who are nationally known in fur circles for their production of silver fox.

A factory producing a nationally known brand of outboard motors and small gasoline engines is located
2586 at Cedarburg. The loads of all industries within the city are served by the municipal utility, but the surrounding area is served by Wisconsin Gas & Electric Company.

The City of Hartford, Wisconsin, operates a steam generating system which produces all the energy required on the distribution system operated by the city. Hartford is located in the open area in the southwest corner of Washington County.

Hartford has a population of 3000 and the municipal electric system operated by the city serves ap-

proximately 1500 customers, a number of whom are

—1,246—

located outside the city and are not included in the population figure.

The open area south of the symbol indicating the city, represents rural territory served from the system operated by the city. The division of that territory from that of Wisconsin Gas & Electric Company is by agreement between the municipal system and the company. 2588

In 1939, the Hartford municipal utility sold approximately 2,300,000 kilowatt hours to its customers. Hartford is within the general resort area lying in that part of the state and derives a large part of its business from the resort traffic.

The third municipal electric utility generating its own power requirements and operating within the territory of Wisconsin Gas & Electric Company, is that operated by the Village of Lake Mills, Wisconsin.

Lake Mills is located in the western portion of Jefferson County, northwest of the City of Jefferson. 2589

The symbol shown on the map is the one indicating a community served retail from the system of one of the companies. In this case the symbol represents retail service from the gas system of Wisconsin Gas & Electric Company. Wisconsin Gas & Electric Company has no interconnection with the electric system in Lake Mills and sells no energy to that system.

—1,247—

The municipal electric system has a Diesel engine generating system with a capacity of 1100 kilowatts.

2590 In 1939 the system distributed about 1,800,000 kilowatt hours to approximately 1000 customers.

Q. Now, in order to get an idea as to the importance of other communities which Wisconsin Gas & Electric serves, other than those which you have already named, would you indicate the communities served by the company having a population in excess of 3000? A. Do you mean Wisconsin Electric Power Company?

2591 Q. I am sorry—Wisconsin Electric Power Company. A. Yes. Wisconsin Electric Power Company renders electric service in the City of Racine, which has a population of 67,159. Racine is located on the west shore of Lake Michigan, about twenty-five miles south of Milwaukee, and is the second largest industrial city in the State of Wisconsin.

It is served by two steam railroads, one interurban electric railway, and several bus and truck lines.

Racine is widely known for the manufacture of farm implements, milk products, floorwax, and a wide range of specialized machinery. The principal industries are the Ajax
2592 Manufacturing Company; the Belle City Malleable Company; the J. I. Case Manufacturing Company, manufacturers of tractors and other farm equipment; S. C. Johnson & Sons, manufacturers of floorwax and furniture polishes; the Hamilton-Beach Manufacturing Company, which produces vacuum cleaners; the Horlick Malted Milk Company, manu-

facturers of malted milk products; the Nash-Kelvinator Corporation which I mentioned before as being the producer of Nash automobiles—their automobile plant is in Kenosha but they have a plant in Racine—the Twin Disc Clutch Company,

manufacturers of specialized machinery connections; and the Young Radiator Company.

In addition to the industrial activity carried on in Racine, Racine also conducts considerable business resulting from agriculture in the surrounding areas.

It has large residential districts both within the city and outside the city in residential suburbs.

The population of these residential areas are employed very largely in the industries within and surrounding the city. 2594

South Milwaukee, Wisconsin, receives electric service from Wisconsin Electric Power Company. It is a residential suburb of Milwaukee, located about ten miles south of Milwaukee. Its population is 11,115.

There are a number of industries located in South Milwaukee, the principal one being the plant of the Bucyrus Erie Company, which manufactures heavy excavating equipment and road-building machinery.

Plants of the Line Material Company, Badger Malleable & Manufacturing Company, Midwest Tanning Company, The Rapco Leather Company, and the Wisconsin-Appleton Company, manufacturers of electrical wiring fittings, are located 2595

—1,249—

in South Milwaukee.

A chemical plant of the DuPont Company is located near the city on the south.

The City of Cudahy, located six miles south of Milwaukee on the shore of Lake Michigan, is served by Wisconsin Electric Power Company.

It is largely a suburb of Milwaukee and is an important unit in the Milwaukee industrial area. Large residential dis-

tricts are located in Cudahy, the residents of which are employed generally in Cudahy or South Milwaukee, or in Milwaukee, itself, in the industries located in those cities.

Within the City of Cudahy are located the plants of the Ladish Drop Forge Company, manufacturers of heavy drop forgings; The Sherer Leather Company, producers of leather; Cudahy Brothers Company, operators of large packing plants; and George J. Meyer Manufacturing Company, which manufactures bottling machinery of all types.

2597 Q. What is the population of Cudahy? A. The population of Cudahy is 10,550.

The City of West Allis, with a population of 36,146, is located immediately west and somewhat south of the City of Milwaukee, and is adjacent to Milwaukee.

West Allis is a very highly industrialized community. Its principal industries include a wide variety of machinery —1,250— manufacturing plants, steel fabrication plants and foundries.

Among these are the Allis-Chalmers Manufacturing Company widely known for its manufacture of power generating 2598 equipment, tractors and other heavy machinery; the Fulton Company; The LeRoi Motors Company; Kearney & Trecker Corporation; and Harnischfeger Corporation, manufacturers of heavy cranes and hoisting equipment, very well known among power plant builders; the Federal Malleable Company; the Pressed Steel Tank Company; the Sterling Wheelbarrow Company; Motor Castings Company; and Davis & Thompson Company.

The latter firm specializes in the design and manufacture of unusually specialized machinery for the performance of particular and precise operations in manufacture.

There are many other industries located in West Allis, but those I have named are among the better known ones and the principal ones.

The City of Wauwatosa is located on the west of Milwaukee and adjacent thereto. It has a population of 26,701 and is almost exclusively a residential suburb of Milwaukee. There are no important industries in Wauwatosa, the residents of the city being employed very largely in business and other lines of endeavor in the Milwaukee industrial area.

West Milwaukee is also a suburb of Milwaukee, located 2600
on the southwest part of the city limits of Milwaukee. Diversified industries are located there, including the Krause

—1,251—

Milling Company; the Linde Air Products Company, which produce various types of compressed gasses; The Robert A. Johnston Company, manufacturers of candies, cookies and crackers; The John Graf Company, producers of Graf beverages, including carbonated drinks and malt liquors; the Chain Belt Company, manufacturers of power machinery; the Cream City Boiler Company, manufacturers of steam boilers; and the Milwaukee Metal Spinning Company, which 2601
produces spun metal products.

The population of West Milwaukee is 4,423. Many of the residents of West Milwaukee are employed in the industries in the City of Milwaukee and other suburbs other than that of West Milwaukee, itself.

Shorewood, with a population of 15,085, is a residential suburb located on the shore of Lake Michigan, immediately north of Milwaukee. Electric service there is rendered by Wisconsin Electric Power Company.

There are no major industries in Shorewood, the residents of the village being employed in professions and commerce and other activities in the industrial area as a whole.

The Village of Whitefish Bay, Wisconsin, is located immediately north of Shorewood and adjacent to it. It is also a residential suburb of greater Milwaukee, the residents being employed in the professions and other activities in the general area.

Whitefish Bay has a population of 9,479. —1,252—

Wisconsin Electric Power Company renders electric service in the City of Port Washington, which is situated about twenty-five miles north of Milwaukee on the shore of Lake Michigan.

It is identified by a small area which is cross-hatched to indicate service by Wisconsin Electric Power Company, although the area is completely surrounded on the north, west and south, by the territory served by Wisconsin Gas & Electric Company.

Port Washington is the point at which the Port Washington power plant of Wisconsin Electric Power Company is located.

The city consists very largely of residential areas and is well known in the middle west for its fishing activity. The Smith Brothers operate extensive fisheries on Lake Michigan and Lake Superior, one of which has its headquarters at Port Washington.

There are a few industries located at Port Washington, among which are the factory of the Wisconsin Chair Company, two foundries and a manufacturer of concrete mixing machinery.

2605

Oconomowoc, Wisconsin, is a city located within the territory of Wisconsin Electric Power Company, which is served at wholesale by the company. It is located on the map toward the western end of the territory of Wisconsin Electric Power Company, near the west line of Waukesha County, and about one-third of the distance south from the

—1,253—

north county line.

Oconomowoc operates a municipal electric distribution system and purchases its entire power requirements from 2606
Wisconsin Electric Power Company.

The municipal system in the city serves about 1,800 customers and in 1939 it purchased 4,847,539 kilowatt hours from Wisconsin Electric Power Company.

Oconomowoc has a population of 4,524 but few important industries. Among the industries which are located there are dairy plants, a pea cannery where the—strike that. I was going to give you the name of the peas but it slipped my mind—and the milk condensery of the Carnation Milk Company.

2607

Mr. Hamilton: This is a satisfactory breaking point.

The Examiner: All right. We will recess until 2:00 o'clock.

(Whereupon, at 12:30 o'clock p. m. the hearing recessed until 2:00 o'clock.)

—1,254—

2608 *Edward H. Schmidtman—By Respondents—Direct*

AFTERNOON SESSION

(Whereupon, at 2:00 p.m., September 9, 1940, the hearing reconvened.)

The Examiner: You may proceed.

Whereupon, EDWARD H. SCHMIDTMAN the witness on the stand at the time of recess, resumed the stand, was examined and further testified as follows:

2609 *Direct Examination by Mr. Hamilton (resumed):*

Q. Mr. Schmidtman, you were describing the cities served by Wisconsin Electric Power Company. Had you finished that description? A. No, I hadn't finished. I would like to take up Milwaukee.

Milwaukee is the largest city served by Wisconsin Electric Power Company.

Its population, according to the 1940 preliminary census figures was 598,558.

The city of Milwaukee covers an area of 44.1 square miles —that is, within the corporate limits.

2610 It is located on the shore of Lake Michigan at the junction and mouth of three rivers—the Milwaukee, the Menominee, and the Kinnickinnic.

—1,255—

Q. I wonder if you would speak just a little louder, please. A. Yes.

The mouth of these three rivers really formed the topographic reason for the original settlement of that spot as the city of Milwaukee, and the rivers are now used to quite an extent as harbors and points of entry for lake shipping that comes into the Milwaukee harbor.

2611

There are extensive piers and ferry slips located on these three rivers and on canals dug between them, and altogether they constitute what is considered the inner harbor of the port of Milwaukee.

There are 144,000 dwellings in the city of Milwaukee, of which 42 per cent. are owned by their occupants. Among the cities of the United States, having a population of 500,000 or more, Milwaukee ranks second in the percentage of families owning radios.

It ranks third in the percentage of families owning homes 2612
and fourth in the percentage of families living in individual dwellings.

The people of Milwaukee are very home conscious, as indicated by the high percentage of property ownership and high percentage of families living in individual dwellings rather than in duplexes and apartment buildings.

Milwaukee is served by three large trunk line railroads

—the Chicago & Northwestern, the Chicago, Milwaukee, St. Paul and Pacific, and the Minneapolis, St. Paul & Sault St. Marie—the latter commonly known as the Soo Line. 2613

The city is also served by six bus lines, seven steamship and barge lines, two car ferries, two transcontinental air-lines, and forty truck lines.

Milwaukee is one of the leading industrial centers of the middle west, ranking ninth among the cities of the United States in the value of annual manufactured products.

Normally almost two thousand industrial plants employ approximately 140,000 people and pay them annual wages amounting to more than two million dollars, and produce goods valued at about one billion dollars a year.

2614 Milwaukee is noted for the worldwide use of its products and for the wide diversification of the industries located there.

In order of importance, the leading manufactured products of Milwaukee are:

First, agricultural implements.

Next, motor vehicle bodies and parts.

Meat Packing products.

Malt liquors, including beer and ale.

2615 Electrical machinery, apparatus and supplies.

Malt, which is a product used in the manufacture of malt liquors.

—1,257—

Steel works and rolling mill products.

Cranes, dredging and excavating machinery.

Bakery products.

Hosiery.

Boots and shoes.

Printing and publishing.

Paints, pigments and varnishes.

2616 Stamped and pressed metal products, including enameling, japanning, and lacquering.

The following well-known industries have plants in the city of Milwaukee:

Briggs & Stratton Corporation, which manufactures automobile accessories and small gasoline motors.

Cutler-Hammer, Incorporated, manufacturers of electrical control equipment.

Delta Manufacturing Company, which produces small wood-working machinery for shops and home use.

The Evinrude Motors Division of the Outboard Marine and Manufacturing Company, which manufactures Evinrude outboard boat motors.

The Falk Corporation, which manufactures heavy machinery and gears, pumps, and heavy equipment of that sort.

The Globe Steel Tubes Company, which manufactures seamless steel tubes for use in boilers, industrial plants in general, and for steel pipe lines.

Globe Union, Incorporated, which manufactures the Globe storage battery, and also recently they have gone into 2618

sidelines, such as roller skates, radio parts, ceramic products.

Harley-Davidson Motor Company, which manufactures the Harley-Davidson motorcycle.

Holeproof Hosiery Company, which knits silk hose.

International Harvester Company, manufacturer of farm equipment.

The Milwaukee plant of International Harvester Company manufacturers trucks.

Linde Air Products Company, producers of compressed gases—acetylene and various other gases used in compressed 2619 form.

Miller Brewing Company, manufacturers of Miller High Life beer and ales.

Nash-Kelvinator Corporation, whose Milwaukee plant manufactures bodies for the Nash automobile.

Pabst Brewing Company, manufacturers of beer and ale.

Phoenix Hosiery Company, another plant which knits full-fashioned hose.

Pittsburgh Plate Glass Company, whose paint and varnish division is located—or one of whose paint and varnish divisions is located in Milwaukee.

Joseph Schlitz Brewing Company, manufacturers of beer and ale.

The A. O. Smith Corporation, manufacturers of welded

—1,259—

steel pipe, automobile frames, and other products, from sheet steel and pressed metal.

Square D Corporation, manufacturers of electrical switching equipment.

Swift and Company, a packing concern.

2621 Q. Is there a municipal plant in Milwaukee? A. The city of Milwaukee operates a small steam power generating station at the municipal garbage incinerator plant.

This steam generating station utilizes heat generated in burning the garbage, and the power generated through that operation is used in operating the equipment at the incinerator plant, such as hoisting the garbage for burning it and handling the ashes, and so forth.

The surplus of the output over those requirements is delivered into the system of Wisconsin Electric Power Company as dump electric power.

2622 The generating station of the city is not a public utility and is no part of a public utility, inasmuch as it serves no customers directly.

All of the energy is used either in the incinerator plant or delivered into the system of Wisconsin Electric Power Company.

The generating station has no other outlet for its power. The power generated at that plant is highly variable with

—1,260—

respect to availability. In the winter time the garbage that is delivered to the plant from all over the city contains more

heat than the garbage that is delivered in the summer, because in the summer time the garbage contains large quantities of melon rinds and grapefruit skins and leaves and peelings from fresh vegetables, which are wet and don't burn well, so during that season of the year it is frequently necessary for the city to apply oil—used cylinder oil from filling stations—to the garbage in order to make it burn.

Under those circumstances, of course, you can be sure that the fuel wouldn't produce enough heat to generate any appreciable quantities of steam. most of the heat being consumed in burning the garbage itself. 2624

Q. There is no other electric utility service in the city of Milwaukee? A. No, there is not.

Mr. Hamilton: May this document be marked as Respondents' Exhibit Number 33 for identification?

The Examiner: It may be so marked.

(The document referred to was marked Exhibit 33 for identification.)

By Mr. Hamilton:

Q. Will you explain, Mr. Schmidtman, what Respondents' 2625

Exhibit No. 33 for identification portrays? A. Exhibit No. 33 is a tabulation showing the number of customers at the end of the calendar years, and the total annual sales of electricity during the calendar years from 1910 to 1939, for Wisconsin Electric Power Company; from 1912 to 1939 for Wisconsin Gas & Electric Company, and from 1923 to 1939 for Wisconsin Michigan Power Company.

Q. Has this table been prepared under your supervision? A. Yes, it has.

2626 *Edward H. Schmidtman—By Respondents—Direct*

Q. Have the facts shown been taken from the records of the respective companies indicated? A. They have.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 33.

Mr. Binford: I would like to ask one or two questions, please.

By Mr. Binford:

Q. The number of customers refers solely to customers
2627 furnished with electric energy? A. Yes, with electric energy only.

Q. The table has no reference in any way to gas service to customers? A. None whatever.

Q. And in each case the figures given are as of the end

of the calendar year indicated? A. The number of customers shown are as of the end of the calendar year, and the kilowatt hours sold are during the calendar year.

Q. During? A. Yes.

Mr. Binford: No objection.

2628

The Examiner: The tabulation is admitted in evidence as Respondents' Exhibit No. 33.

(The document referred to was received in evidence as Respondents' Exhibit No. 33.)

By Mr. Hamilton:

Q. Referring to Exhibit No. 33, Mr. Schmidtman, do the statistics shown include sales by the respective companies to other electric utilities? A. Yes, they do, and that fact is indicated by Note One at the bottom of the exhibit.

Q. More specifically, the table, then, includes sales by Wisconsin Electric Power Company to the other two companies named in the table? A. Yes, the sales shown for Wisconsin Electric Power Company include sales to all electric utilities including Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company.

—1,263—

Likewise, the figures for Wisconsin Gas & Electric Company include all sales to other electric utilities, including— Wisconsin Gas & Electric Company doesn't sell any energy to 2630 either of the other two companies.

The figures for Wisconsin Michigan Power Company include all sales to other electric utilities, including the sales of that company to Wisconsin Electric Power Company.

Q. Now, the figure shown for the year 1939 as kilowatt hours sold by Wisconsin Gas & Electric Company appears to be a figure somewhat in excess of 170 million kilowatt hours.

Do you have the figures for the sales for that year by Wisconsin Electric Power Company to Wisconsin Gas & Electric Company? A. Yes. During the year 1939 Wisconsin Electric Power Company sold to Wisconsin Gas & Electric Com- 2631 pany 206,189,655 kilowatt hours.

That figure does not appear individually in the tabulation.

Q. But is to be included in the amount sold by Wisconsin Electric Power Company? A. That is correct.

Q. Can you explain the excess of the figure which you have last given over the figure of 170 million plus shown on the table? A. Yes. A portion of the kilowatt hours which

—1,264—

Wisconsin Electric Power Company sells to Wisconsin Gas & Electric Company in every year is used by the latter company in conducting its own operations.

The major portion of that use by Wisconsin Gas & Electric Company is consumed in operating its gas plant at Racine, and that energy is not resold by Wisconsin Gas & Electric Company.

Another portion of the kilowatt hours purchased by Wisconsin Gas & Electric Company is consumed in the form of
2633 losses incurred in distributing the energy which is sold to its customers.

Those two items—that is, the company's own use and the losses in transmission and distribution—account for the difference between the energy sold to Wisconsin Gas & Electric Company and the amount of energy sold by it to its customers.

In addition to the energy which Wisconsin Gas & Electric Company purchases from Wisconsin Electric Power Company, Wisconsin Gas & Electric Company also generates a small amount of energy.

2634 In the year 1939 its generation was less than one per cent of its total energy requirements.

Q. I note from the table that, while the statistics on Wisconsin Electric Power Company are first given for the

year 1910, statistics for the other two companies indicated began at later periods. Will you explain why the later period is used? A. In each case we began the data for the respective companies in the earliest year at which continuous records down to the present time began.

2635

Such records began in 1910 for Wisconsin Electric Power Company, in 1912 for Wisconsin Gas & Electric Company, and in 1923 for Wisconsin Michigan Power Company.

Q. Will you amplify further the information set forth in Note 2 of the table? A. Yes. Note 2 explains that prior to the year 1938 the kilowatt hours consumed by the transportation operations of the Milwaukee Electric Railway & Light Company, which was the name of Wisconsin Electric Power Company prior to October 1938——

2636

The Witness: Will you read that please?

(Whereupon the last answer was read back by the Reporter.)

A. (Continuing.) —were treated as energy transferred from the Electric Department to the Transportation Department of the Milwaukee Electric Railway & Light Company.

Being treated as a transfer of energy from one department to another, these kilowatt hours were not included in the kilowatt hours sold as shown by this tabulation before 1938. However, the energy consumed, at the beginning of 1938, by the Transportation Department was treated, for

2637

—1,266—

accounting purposes, as a sale, and, from that time, such energy has been included with the sales shown on this table.

Q. For the full years 1938 and 1939? A. For the full years 1938 and 1939.

Q. The table indicates a substantial growth in the number of customers and kilowatt hours sold. Has that growth been due entirely to the development of the facilities of the respective companies or has it been due to some other cause

2638 —in part, at least? A. The growth shown here is due in part to acquisitions of small electric utility systems operating in the vicinity of the territories served by each of these three companies. In the case of Wisconsin Electric Power Company, several small systems were acquired during the period covered by these statistics.

Those acquisitions represent a small part of the extent of service rendered by the Company, and the last one was made in 1930, when Wisconsin Electric Power Company
2639 acquired the municipal electric distribution system in the city of Port Washington.

Since the year 1930, Wisconsin Electric Power Company has made no such acquisitions and all of the change in load since that time has come about through development of the territory served by the Company and through more extensive development of the service needs within its area.

—1,267—

In the case of Wisconsin Gas & Electric Company, it is likewise true that a number of acquisitions were made during the period covered by the tabulation.

2640 The last of such acquisitions was made in 1932, when Wisconsin Gas & Electric Company purchased the properties of the Wisconsin Public Utilities Company operating in and around the city of West Bend and the Village of Barton.

Since 1932 Wisconsin Gas & Electric Company has acquired no electric properties, and the growth in its number of customers and volume of sales has come about as a result of the Company's efforts in increasing the use of its service within the territory served.

Wisconsin Michigan Power Company has acquired small electric systems during the period shown. The last one

2641

acquired was a small distribution system in the community of Trout Creek in Michigan. That community is not shown on Exhibit 32.

The Trout Creek system was acquired in 1929 and since that year no further acquisitions have been made by Wisconsin Michigan Power Company.

The growth in number of customers and kilowatt hours sold since that time has also been a result of the Company's development of service within its area.

2642

Q. I believe you indicated that, with respect to Wisconsin

—1,268—

Electric Power Company there were no continuous records of the number of customers and kilowatt hours sold prior to the year 1910.

Does the Company have any record for any year prior to that time? A. Yes. One of the officers of the Company, who has been with the Company and its predecessors a number of years, has a memorandum record in one of the old volumes of the Company's accounts, which indicates that in 1900 the Milwaukee system served 1,451 customers, who consumed about five million kilowatt hours in that year.

2643

From the period 1900 to 1910, as I have explained, we have no continuous records and the record for 1900 is a memorandum record in one of the older books of the Company.

From that beginning the service of Wisconsin Electric Power Company has increased to more than 250,000 customers and the sales have increased to nearly 1,200,000,000 kilowatt hours.

2644 *Edward H. Schmidtman—By Respondents—Direct*

Mr. Hamilton: May this document be marked as Respondents' Exhibit No. 34 for identification?

The Examiner: Yes.

(The document referred to was marked Respondents' Exhibit No. 34 for identification.)

By Mr. Hamilton:

Q. I will ask you later, Mr. Schmidtman, to explain the

—1,269—

2645 caption headings shown on Exhibit No. 34. Would you, at this time, explain what Exhibit No. 34 purports to portray? A. Exhibit No. 34 is a tabulation showing the number of customers at the end of the year 1939, and the kilowatt hours sold during the year 1939 for each of the three companies in the Wisconsin Michigan group, namely Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company, segregated according to the service classification indicated in the column headings.

Q. This table has been prepared under your supervision?

2646 A. Yes, it was.

Q. Were the facts shown similarly taken from the records of the respective companies indicated? A. Yes.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 34.

Mr. Binford: I would like to ask a question or two in regard to this exhibit.

By Mr. Binford:

Q. Will you please explain the distinction between small commercial and industrial and large commercial and industrial? A. Yes.

Q. They are shown in separate columns on this table?

—1,270—

A. Yes.

I will explain the large commercial and industrial first. The large commercial and industrial group of customers include commercial customers who take service at secondary voltage—that is, below 3800 volts—and who contract to pay for a minimum monthly demand of fifty kilowatts.

The industrial customers included in this group are those customers which are served at primary voltages of 3800 volts, 13,200 volts, or 26,400 volts, who furnish their own sub-stations and who contract for a minimum monthly demand of 100 kilowatts. 2648

The small commercial and industrial customers are the commercial customers and industrial customers who do not qualify under the requirements of the large group.

—1,271—

Q. And there is a further column headed "Other Electric Utilities." Will you please explain what that caption means? A. Yes. That group includes all electric utility systems to which the respective companies shown in the first column sell electrical energy at wholesale rates for resale by those electric utilities. 2649

Included in that caption would be the utilities I discussed this morning as operating in the various municipalities. It also includes, in the case of Wisconsin Electric Power Company—it includes Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company inasmuch as Wisconsin Electric Power Company sells energy to both of those.

2650 *Edward H. Schmidtman—By Respondents—Direct*

In the case of Wisconsin Michigan Power Company, it includes Wisconsin Electric Power Company, because the former sells electricity to the latter.

Mr. Binford: No objection.

The Examiner: Respondents' Exhibit No. 34 for identification is now admitted in evidence.

(The document referred to was received in evidence as Respondents' Exhibit No. 34.)

2651 *By Mr. Hamilton:*

Q. Will you explain further, Mr. Schmidtman, the caption headings shown in the respective columns in addition to

—1,272—

your statement as to three of the columns? A. The data included in the column with the caption heading "Residential" include customers and sales under the regular residential rate of the company for general residential use as well as the customers and sales under the company's residential water heating rates.

2652 In every instance in which we sell residential water heating service, we also sell residential general service. There has been no duplication in the number of customers due to that overlapping of service.

Such customers have been numbered only once although their total kilowatt hour sales have been included under the sales.

The caption "Rural" includes customers taking service under our regular rural service rate, as well as those taking service under the rural water heating rate and the sales

under that caption include the sales under both of those rate schedules.

The small commercial and industrial, I believe I have explained satisfactorily, and also the large commercial and industrial customers. However, I might add that under the small commercial and industrial group we include flat rate commercial lighting, metered commercial lighting, combined light and power, breakdown and demand power, commercial power, optional power, battery charging, cooking and refrigeration, and optional cooking and heating. 2654

—1,273—

The next group which is headed "Other Sales to Public Authorities" includes our sales under the municipal primary rate to Milwaukee City, the municipal primary rate for park lighting, the municipal secondary rate for playgrounds, the municipal secondary rate for Milwaukee City, the municipal primary rate for other cities, and the municipal secondary rate for other cities.

Under "Other Electrical Utilities" we have included all sales to electric public utilities for resale. One group under that caption is the affiiated companies and another is the 2655 non-affiliated systems.

In the last column preceding the total, headed "Railways for Motive Power" we have included our sales to all electric railway systems to which the companies sell electrical power.

Q. Will you state what those railways are? A. I beg your pardon.

Q. Will you state what those railways are? A. Yes. In the case of Wisconsin Electric Power Company, the three customers are the Milwaukee Electric Railway and Transport Company which is the subsidiary of Wisconsin Electric

Power Company, Wisconsin Gas & Electric Company, which operates a small transportation system in the City of Kenosha and the Chicago, Milwaukee and North Shore Railway which operates an electric interurban railway line between Chicago and Milwaukee.

—1.275—

In the case of Wisconsin Gas & Electric Company, the one customer is the Milwaukee Electric Railway and Transport Company.

2657 Q. You have indicated two of the customers falling under the caption "Other Electric Utilities," Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company, Wisconsin Electric Power Company. What are the other two covered by that caption? A. Sales to other electric utilities you mean?

Q. Right. A. The other two are the City of Oconomowoc, to which the company sells energy wholesale for resale and Wisconsin Power & Light Company with which Wisconsin Gas & Electric Company has an interconnection for

2658 the interchange of emergency service.

Q. Other than sales to municipal electric companies, is there, in the case of Wisconsin Gas & Electric Company, any other electric utility comprehended by the caption there? In other words, are the seven customers listed solely municipal electric utilities? A. I will check that. Yes, they are.

Q. And I believe you have indicated that the figures shown for Wisconsin Michigan Power Company include sales by it to Wisconsin Electric Power Company? A. Yes, I have. That is the case.

—1,276—

Q. There appear on the table two items captioned "Adjustment," and each bearing an asterisk, and there also appears an asterisk footnote. Will you explain further the significance and necessity for the asterisk footnote? A. As I have pointed out, this tabulation includes sales to other electric utilities. Included in the sales by Wisconsin Electric Power Company to other electric utilities are its sales to Wisconsin Gas & Electric Company.

That electric energy is then resold by Wisconsin Gas & Electric Company to its customers. 2660

Now, in order to prevent a duplication of energy—that is, in order to keep those same kilowatt hours from appearing twice in the tabulation, it is necessary to subtract them from the total sales for the group.

The same thing is true with respect to energy sold by Wisconsin Electric Power Company to Wisconsin Michigan Power Company and by Wisconsin Michigan Power Company to Wisconsin Electric Power Company.

Those three sales constitute the three customers shown in the adjustment under "Other Electric Utility Customers" and the 259,968,493 kilowatt hours adjustment under that 2661
caption represent the kilowatt hours involved in this interchange.

Q. Is there a substantial degree of diversity in the service requirements of the customers of the respective companies?

— —1,277—

A. Yes, there is. The service requirements of the customers served by the three companies vary all the way between two widely separated extremes. The average small customer or rather the typical smallest customer of any of the companies would be a residential consumer using little or no energy in a month.

2662 *Edward H. Schmidtman—By Respondents—Direct*

We have, as all electric utility systems have, a number of so-called minimum bill customers. Our bill for such customers is 60 cents a monthly net. That is a service charge which is made against the customer whether he consumes any kilowatt hours or not and it is intended to cover the fixed components of the cost of rendering electric service.

From a customer of that kind the service requirements range up to the requirements of huge industries that consume several million kilowatt hours a month, and the bills
2663 will range from the minimum of 60 cents to well up into tens of thousands of dollars.

To give an indication of the distribution of our customers over this wide range of service requirements, I can say that 80 per cent of the customers of Wisconsin Electric Power Company are residential customers. Slightly over 6 per cent are rural customers, 12 per cent are small commercial and industrial—I am speaking now with respect to number of customers—and the remaining one odd per cent of our cus-

—1,278—

tomers are made up of large commercial and industrial, street
2664 and highway lighting, other public authorities, other electric utilities, and electric railways.

Now, with respect to the kilowatt hours sold to these various classes of customers, the residential consumers take about 22 per cent of our total sales.

The rural customers take about 2½ per cent. The small commercial and industrial customers consume about 14 per cent. The large commercial and industrial consume more than 45 per cent. Street and highway lighting customers take nearly 3 per cent. Other public authorities nearly 2 per

cent; other electric utilities a little over 3 per cent; and electric railways about 7½ per cent.

Q. Are these percentages which you have given applicable in the case of Wisconsin Electric Power Company or are they on the basis of three company figures? A. They are applicable to Wisconsin Electric Power Company only.

Q. You were speaking of the diversification of use among various customers. Can you amplify that further? A. Yes, I can. The service requirements of electrical customers vary from those of consumers in small apartments or one-room 2666
cottages, many of whom are our minimum bill customers, to those of people who live in all-electric homes, a large number of which we serve.

—1,279—

An all-electric home will include the usual lighting and electrical appliances as well as electric range, an electric water heater, an electric air-conditioning system. Such customers will consume from 6000 to twelve or fifteen thousand kilowatt hours a year each—one residential customer. The use of electricity in our rural areas also varies over quite a wide range. 2667

Some of our farm customers use electric service for residential use only. Some of them expand that use to include yard and barn lighting, and others use it for a still wider variety of purposes.

Among these are the operation of milking machines, pumping water, cutting and elevating silage, heating seed beds, and irradiating cattle and chickens, and numerous other purposes.

Some of the other purposes would be operating an electric fence. An electric fence consumes very little electrical

2668 *Edward H. Schmidtman—By Respondents—Direct*

energy but it is one of the ways in which the modern farmers in our territories are making use of our service. An electric fence is a rather ingenious device by which a cow or any other animal that comes too close to the fence will receive a pulsating shock. It isn't harmful but it is very effective.

Electricity is used by farmers in heating seed beds—more generally, however, by operators of greenhouses and individuals who raise plants for sale for planting in gardens

2669 —1,280—

and vegetable beds.

These seed beds are heated by cables buried in the soil which maintain a higher temperature in the soil and produce quicker and much stronger germination of the seeds, resulting in an earlier start and more hardy plants.

Electricity is used in sun lamps for subjecting cattle and flocks of chickens to ultra-violet rays. It has been found that the use of sun lamp irradiation on cattle has resulted in a marked reduction in bacterial content of the milk, a greater resistance on the part of cattle to common diseases and a

2670 much lower mortality in calves. It has been used on test flocks of chickens and a wide range of tests indicates that the productivity of the chickens in number and weight of eggs laid can be increased by as much as 20 per cent in a flock that is irradiated in comparison with one that isn't.

An outstanding example of extensive use of electricity on the farm in the territories served by the Wisconsin-Michigan group is found in the case of the Brook Hill Dairy Farm which is served by Wisconsin Electric Power Company. That farm consumes well over a hundred thousand kilowatt hours a year.

2671

It comprises a total of nine milk-producing farms, all operating under one joint management. The herd that they

—1,281—

have on those farms numbers a little over eight hundred cows. The cows aren't all yielding at the same time but they are all active members of the herd and when a cow goes dry she is transferred to what they call the dry farm and is kept there until she again begins giving milk and then she is brought back to one of the producing farms.

2672

Three of these farms produce certified milk. No—two of them produce certified milk. And the Brook Hill Farm is one of the three dairy farms in the entire state of Wisconsin which are allowed to produce certified milk. Certified milk is not pasteurized; it is marketed raw, and in order for farms to have the permission of health authorities to market such milk, they must answer to very rigid requirements of sanitation.

2673

The other two farms in Wisconsin which produce certified milk are located in the immediate vicinity of the Brook Hill Farm and are both served by Wisconsin Electric Power Company.

Now, the connection of certified milk to electric service may seem farfetched except when we consider that dairy farm sanitation is directly related to the availability of water and refrigeration, and both the water and the refrigeration are furnished electrically on these farms.

Mr. Hamilton: Off the record.

(Discussion off the record.)

—1,282—

Mr. Hamilton: Back on the record.

By Mr. Hamilton:

Q. You have indicated that Wisconsin Michigan serves a substantial rural territory. Is that also true of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company? A. Yes, that is true. Particularly of Wisconsin Gas & Electric Company. Wisconsin Electric Power Company does serve a very highly developed agricultural area in Waukesha County—one of the richest agricultural counties in the State of Wisconsin.

Wisconsin Gas & Electric Company, serving the rim of territory lying all the way around that of Wisconsin Electric Power Company, naturally reaches into more of a rural area than Wisconsin Electric Power does in serving the industrial section along the lake.

I have mentioned the milk condenseries and processing plants and the production of butter and cheese in the communities served by Wisconsin Gas & Electric Company. Those industries bear out the presence of very active dairying territory in the entire district served by the company. Wisconsin is one of the foremost dairying states of the Union and our territories are among the best of the dairying districts in the State.

Q. What is the largest customer of Wisconsin Electric

Power Company? A. The customer that takes the largest amount of energy from Wisconsin Electric Power Company is Wisconsin Gas & Electric Company. Due to the diversification of loads served by Wisconsin Gas & Electric Company the character of its demands upon the system of Wisconsin Electric Power Company with respect to hour of

the day and seasons of the year, is very much like the demands of Wisconsin Electric Power Company's own direct loads, and because of that diversity or diversification, the loads fit in very well, being of much the same character.

In 1939, Wisconsin Michigan Power Company purchased —I am sorry—Wisconsin Gas & Electric Company purchased 206,189,655 kilowatt hours from Wisconsin Electric Power Company and imposed a maximum demand of 49,133 kilowatts. Of those total sales, 198,546,493 kilowatt hours were 2678
for resale by Wisconsin Gas & Electric Company to its own customers, the remainder—that is, the difference—being used by Wisconsin Gas & Electric Company in carrying out its own operations.

Q. What is the largest ultimate consumer of Wisconsin Electric Power Company? A. The A. O. Smith Corporation is the largest ultimate consumer of Wisconsin Electric Power Company.

Q. You are speaking outside of the system, are you not?

—1,284—

Isn't the Transport Company a large consumer? A. Yes, I 2679
am sorry. I was thinking of private customer. The Milwaukee Electric Railway and Transport Company is the largest ultimate consumer on the system of Wisconsin Electric Power Company. That is the transportation subsidiary of Wisconsin Electric Power Company.

Q. Are all of its requirements purchased from the Wisconsin Electric Power Company? A. Yes, they are.

Q. Of its electrical requirements? A. All of their electrical requirements. Prior to October of 1938, as I have previously testified, the transportation operations were carried on as a part of Wisconsin Electric Power Company whose

2680 name was then the Milwaukee Electric Railway & Light Company.

The power which is purchased by Milwaukee Electric Railway and Transport Company is all 600-volt direct current energy which is used for motive power in operating the street cars, trolley busses and interurban railway cars, and some alternating current service used in its shops and in lighting its office and storeroom buildings.

Delivery of 600-volt direct current energy is made at
2681 thirty different railway sub-stations which are owned and operated by Wisconsin Electric Power Company. These sub-stations are located all over the area which is served by the

—1,285—

Milwaukee Electric Railway and Transport Company.

Q. Could you indicate generally what that area served with transportation service is? A. Yes. The Milwaukee Electric Railway and Transport Company operates a street railway system with auxiliary gasoline busses in the City of Milwaukee and its immediate suburbs.

In the same area it also operates trackless trolley lines in
2682 serving the metropolitan area. It also operates an interurban electric railway system reaching north to Port Washington, west to Watertown and south to Kenosha.

A shorter branch of the interurban line runs as far south as Hales Corners on the western part of the Milwaukee County.

Q. The points of delivery to the Transport Company are not confined to Milwaukee proper then, are they? A. No, they are not. They are not. As I have just stated, the interurban system reaches out into neighboring cities.

—1,286—

By Mr. Hamilton:

Q. They deliver at the neighboring cities as well? A. Yes, delivery of energy to the Transport Company is made at a number of points, many of which are located considerable distances from Milwaukee.

Delivery is made in those instances through railway substations. Some energy is delivered directly to the Transport Company within the City of Milwaukee and is generated there, but that represents a minor portion of the total consumption. Most of the energy delivered to the Transport 2684
Company is energy that has been converted from alternating current to direct current for use in the trolley system.

Q. What is the approximate consumption of current by the Transport Company which it purchases from Wisconsin Electric Power? A. That varies somewhat from year to year but normally ranges between ninety million and one hundred million kwh per year, at demands running up to 42,000 kilowatts.

Q. Can you indicate the extent of the demand placed on Wisconsin Electric Power Company system by industrial users in the territory served? 2685
A. The industrial customers of Wisconsin Electric Power Company who, as I have explained, take their service at primary voltage, constitute only two-tenths of 1 per cent. of the number of customers served, but their consumption amounts to 45½ per cent. of the total

by the company.

Q. Your figure of 45 per cent., is that expressed in terms of kilowatt hours? A. Yes, 45½ per cent. of the kilowatt hours sold by the company, are sold to the industrial customers.

This class includes 230 consumers and in 1939 those consumers purchased nearly 360,000,000 kilowatt hours. They represent a very wide diversification of industry, also. Altogether there are more than forty different classes of industry represented in that group, many customers falling in each of the several classes.

The largest of these groups are automotive specialties, fifteen customers; bakeries, seven; dairies and dairy products, eight; electrical equipment manufacturing, eleven; iron
2687 and other metal foundries, twenty; electric steel foundries, eight; grain elevators and malting manufacturers, eight; ice manufacturing, ten; heavy machinery manufacturing, ten; light machinery manufacturing, eight; steel fabrication, fourteen; and tanning, eleven.

The other one hundred-odd customers represent more than thirty different types and there are smaller numbers in each of the various groups.

Now, the character of our industrial service is generally indicated by this array of industry. According to data published by the Milwaukee Association of Commerce, the Mil-
2688 waukee industrial area, including Milwaukee, Racine and

—1,288—

Kenosha, consumes more steel—consumes, not produces—more steel than any other similar area in the United States.

It leads in the country in the production of heavy pumping machinery, hydro-electric generating equipment, large excavators.

Milwaukee, itself, leads the country in production of silk hose. The tanneries that are located in the City of Milwaukee constitute one of the major industries. One of the tanneries there, Gallun & Sons Company, produces a type of leather

2689

that is produced nowhere else other than in Norway. It is called a Norwegian calf and is a vegetable tanned leather, a choice leather.

I don't know why it is that the tanneries have located so largely in the Milwaukee area, but they are there and they represent one of the major classes of the industry served by the company.

Possibly, it is related to the dairying industry and the meat-packing industry, resulting in the production of hides for tanning.

2690

Q. Does the Wisconsin Electric Power maintain detailed data on industrial users? A. Yes, they do. We make a practice—speaking of the Wisconsin Electric Power Company—of maintaining a running record of the demand and energy consumption of the thirty largest industrial customers

—1,289—

served by the Wisconsin Electric Power Company.

These thirty customers represent a wide range of type of industry and we have learned that statistics on their requirements furnish a very good barometer of industrial activity in the Milwaukee area.

2691

We have kept this record for a number of years and use it to a considerable extent in framing load estimates, making budgets and other estimates which are influenced by anticipated industrial activity in the territory.

Now, we also keep similar records on the consumption and demand of the A. O. Smith Corporation, which is the largest single private customer served by Wisconsin Electric Power Company. This customer is so much larger with respect to power requirements than any of the other thirty that we find it necessary to hold it out separately from the

2692 *Edward H. Schmidtman—By Respondents—Direct*

group because of the heavy effect it has on the averages, but we nevertheless maintain those records and watch them carefully in connection with our anticipated industrial activity.

These thirty-one customers are all primary customers; that is, they take service at the primary voltages of 3810, or 13,200, or 26,400 volts. They own and operate their own step-down sub-stations.

The thirty-one customers have sub-stations with a total capacity of over 130,000 kva. Their demands on the system,

2693 —1,290—

of course, are not coincident. That is, they don't all reach their maximum values at the same time, but the total non-coincident maximum demands of these thirty-one customers was 65,000 kilowatts in 1939 and the combined consumption of these thirty-one customers was over 201,000,000 kilowatt hours.

You will observe that this quantity of energy is well over one-half of the 360,000,000 taken by the 230 industrial customers, and it is more than one-fifth of the total sales of

2694 Wisconsin Electric Power Company to all of its customers, so we feel that in taking these thirty-one customers as a barometer, we are using a very substantial and most representative sample of our industrial service.

Q. When you say that that sale represents more than one-fifth of total sales, don't you mean total sales to ultimate consumers, rather than total kilowatt hours sold? A. Yes.

Q. You are distinguishing in that instance—— A. (Interposing) Yes; one-fifth total sales to ultimate consumers. That is right. I didn't say that, but I should have.

Q. You spoke of the A. O. Smith Corporation. Does that demand upon the system create peculiar service problems? A. The A. O. Smith Corporation does make some very heavy

—1,291—

demands upon the system of the Wisconsin Electric Power Company and in meeting the requirements of that customer, the company has been required to install special facilities for carrying service to the customer's sub-station.

The A. O. Smith Corporation uses electricity for operating presses and cold process machines of all descriptions. 2696 The plant obtained some fame a few years ago because of its automatic automobile frame plant.

It had an assembly line arrangement which would turn out automobile frames with a minimum of manual labor. The presses would take the sheets which had been previously cut in the proper shape and would press them cold into the channels and the braces that were required in making the frames. Those would be passed on by mechanical conveyors and picked up automatically by the machine as the elements of the frame went through and the frame would gradually take shape. 2697

Automatic machines would place the rivets and rivet them over and the frame would come off at the end completely assembled. Very little manual work was required.

Up to fourteen years ago, the A. O. Smith Corporation generated a portion of its own power requirements and purchased the remainder from the company. Since that time, however, the customer has purchased all of its energy from Wisconsin Electric Power Company.

The principal product of that customer is, at the present

—1,292—

2698 time, welded steel pipe of various diameters.

This pipe is used in building pipe lines, oil pipe lines, gas transmission lines and is also used quite extensively for oil well casings.

Their plant also produces stills of various sizes for use in distilleries and chemical plants, and other plants that have use for equipment of that kind. They also make welded steel tanks, one of the special types of which is a glass-lined tank which they make for chemical plants.

2699 Wisconsin Electric Power Company delivers service to the A. O. Smith Corporation at 26,400 volts over three circuits which were built particularly for that service. These circuits receive their power from the Granville Sub-Station which is one of the major sub-stations in the company's system and serves the industrial loads in the northern and western portion of the Milwaukee metropolitan area.

Q. Are there other large customers whose demands place unusual requirements on the company's service? A. Yes, there are. One of them that is outstanding for that reason is the Bucyrus-Erie Company. This customer manufactures

2700 excavators, steam shovels, drag lines, cranes, dredges, tower excavators, of all types.

An interesting comparison can be made to indicate the range of sizes of excavators made in that plant by pointing out that at one time they had under construction there, two

excavators, one with a capacity of ⅜ of a cubic yard, and one with a capacity of thirty cubic yards.

Electricity is used by the Bucyrus-Erie Company in a number of ways. It is used to operate electric, steel and brass

furnaces for heat-treating, for lighting purposes, of course, and for general power use. 2701

Among the power uses are the handling of the raw materials and their products in various stages of completion, the cleaning of castings, which is done by air and water under pressure, various machining operations, arc welding, and the operation of the machine shop and other general purposes.

The steel melting furnace is the phase of their business that causes unusual service requirements to fall on the system of the Wisconsin Electric Power Company. The loads 2702
imposed by that furnace are very highly intermittent during the melting period.

The furnace has a six-ton capacity and it operates by means of electrodes, controlled by reversing motors. The electrodes are three carbon poles which are forced down into the furnace after the furnace has been filled with the steel that is going to be melted, usually scrap. The moment those electrodes make contact with the steel, the steel short circuits them and a tremendous current flows.

The reversing motors, one of which is on each of the electrodes, will immediately withdraw the electrode in order to 2703

hold the current within the set range, but for the instant the current is tremendous.

It is almost a dead short circuit across the system and the ammeter that measures those currents kicks so violently over against the peg that it is sometimes a marvel that the hand doesn't break off.

It is only instantaneous, however, and then comes back as soon as the reversing motor operates.

2704 Now, we do not bill the customer for those extremely high momentary demands, because the customer's demands on the system are measured through a watt meter which indicates the average demand during each successive fifteen-minute period. Although we don't bill the customer for those instantaneous demands, we still must maintain facilities capable of carrying them and so we have circuits of high capacity and the customer has a sub-station of high capacity, sufficient to carry those instantaneous, high demands with-
2705 out throwing something out of operation.

This customer purchases energy from the company at 13,200 volts which it steps down through its own sub-station and it generates a portion of its energy requirements.

Q. Can you mention a few of the other large users whose services also impose unusual requirements? A. Yes, one of the best known of our customers that has unusual service requirements is the Joseph Schlitz Brewing Company. This

—1,295—

customer manufactures "The Beer that Made Milwaukee Famous", according to their advertisements.

2706 The Schlitz Company operates one of the oldest and largest breweries in the United States. They carry out in that plant all of the stages in the manufacture of beer and ale, including the processing of the malt.

That isn't true of all breweries. Many of the breweries served by the Wisconsin Electric Power Company and the other companies of the group, in fact, buy their malt already processed from malt manufacturing plants, a number of which are served by Wisconsin Electric Power Company.

The Schlitz Company has maintained the same mother yeast plant in its brewery that it had before prohibition

2707

came into effect. They maintained the proper temperature and provided the proper feeding according to the plant chemist, to keep that plant alive and active, and they are still using the yeast from that same plant that they were using before prohibition came into effect.

The power requirements of the Schlitz Company are remarkably steady and continuous. A large amount of the energy which they purchase from Wisconsin Electric Power Company is used in operating refrigerating equipment on which they have a very heavy load.

2708

Electricity is also used in various pumping operations and in the operation of their large kettles and to some ex-

—1,296—

tent in the bottling and barrelling works.

The continuity of service is very important to the Schlitz people because they must maintain careful control of temperatures and timing of operatings in order not to produce a product of variable characteristics.

Flavor is an extremely important thing and timing and temperature are quite important in producing the constant flavor of their product.

2709

Before prohibition, the Schlitz Company generated all of the energy consumed in its operations. After the repeal of the prohibition law, the Schlitz Company began producing regular beer again and found their generating equipment inadequate, so they shut it down and are now purchasing all their electric power requirements from Wisconsin Electric Power Company.

They do still operate a boiler plant which furnishes some steam for processing and furnishes steam for operating

direct driven air compressors which they use in some of their refrigeration operations.

The Examiner: We will have a short recess.

(Whereupon a short recess was taken.)

—1,297—

(Whereupon, after a brief recess the hearing resumed.)

2711 *By Mr. Hamilton:*

Q. What is the largest electric customer of Wisconsin Gas & Electric Company? A. The American Brass Company, located at Kenosha, is the largest customer served by Wisconsin Gas & Electric. This plant is a unit of the Anaconda Wire & Cable Company. It produces copper wire, copper tubing, and also manufactures a wide variety of copper and brass fittings. They utilize electricity in furnaces and many other heating operations as well as for a wide range of general power use and lighting.

2712 Q. Is copper mined in Wisconsin? A. No, it is not. Copper is mined in upper Michigan, outside the territory of Wisconsin Michigan Power Company. The metals are brought in and are worked into the finished product in the mill at Kenosha.

Q. And what is the largest electric customer of the Wisconsin Michigan Power Company. A. The largest customer served by the Wisconsin Michigan Power Company is the Kimberly-Clarke Corporation which I mentioned this morning. That company operates four mills in the Fox River Valley in the vicinity of Appleton and one mill on the Menominee River at Niagara, Wisconsin. The four mills on the

Fox River use water power from the Fox River as well as steam generated in their own plants and in the case of two of

—1,298—

the plants they generate all of the power required in their operations. In the other two plants the power requirements are met partly by generation from water power and partly by purchases from Wisconsin Michigan Power Company. In the case of the latter two plants the sales of Wisconsin Michigan Power Company to the customer are very heavy.

Kimberly Clarke Corporation is installing and buying 2714 machinery at the present time for a new product, the identity of which they have not disclosed, but it will be some new and, it is anticipated, unique application of the use of wood fibres to some sore of paper product.

In connection with that expansion they are providing a new substation with a capacity of 4,000 k. v. a. through which they expect to take power from the Wisconsin Power Company for the new operations.

The hydroelectric plant that is located at Niagara uses water power from the Menominee River as I have previously explained. In 1938 the Wisconsin Michigan Power Com- 2715 pany entered into a contract with Kimberly Clarke Corporation covering the interchange of power between the customer and the company at Niagara. In carrying on its paper mill operations at that point Kimberly Clarke need a constant supply of electric power, more constant than that furnished by the Menominee River through its hydroelectric units, so it was faced with the necessity of purchasing additional energy or of installing additional generating capacity of its

—1,299—

own.

Consideration was given to the installation of a steam plant. Inasmuch as paper mills use steam in their paper processing, many of them have found it economical to first use the steam to generate electricity and then take it from the generating unit and use it for heating purposes. Instead of doing that, however, Kimberly Clarke entered into an agreement with the Wisconsin Power Company by which energy is now interchanged between the customer and the company.

2717 During the seasons when the load is inadequate Wisconsin Michigan Power Company furnishes energy. During the seasons when there is surplus power available it is delivered into the system of the Wisconsin Michigan Power Company.

An interesting provision of that contract, aside from the furnishing of firm power by Wisconsin Michigan Power Company and the furnishing of surplus hydroelectric power, is a provision which specifies that at such times of the year as Kimberly Clarke Corporation can do so it will deliver hydroelectric energy into the system of Wisconsin Michigan
2718 Power Company between the hours of 7:00 a. m., and 7:00 p. m., and Wisconsin Michigan Power Company will return similar or equal amounts of energy during the succeeding period of 7:00 p. m. to 7:00 a. m.

The reason for that arrangement is that it furnishes Wisconsin Michigan Power Company a source of additional energy during the daytime hours when the loads on its system are higher than they are during the night, and also

enables Wisconsin Michigan Power to make up and repay for that energy during the night when its own loads are

lower. The arrangement is entirely for the benefit of Wisconsin Michigan Power Company and does not operate to the detriment of the customer because the customer is able to carry on its operations and perform this interchange of energy at the same time.

This interchange, of course, does not occur during those times of the year when the customer is in need of firm power from the company, or when it is delivering surplus hydroelectric energy to the company.

2720

The Examiner: Does the company get substantial amounts of energy through that interconnection and does it rely on it?

The Witness: No, it does not rely on it and the energy which the company receives through arrangements of this kind is surplus hydroelectric energy for the most part and must be taken into the system of the company at the time when Wisconsin Michigan Power Company already has more energy of that kind than it needs.

2721

The reason that Wisconsin Michigan Power Company is able to accommodate these customers, of which there are several delivering surplus energy into the company system, is that the systems are interconnected through to Appleton where the energy can be consumed, and on through to Milwaukee where there is still a larger market for those quantities of surplus hydroelectric power.

—1,301—

If Wisconsin Michigan Power Company were operating alone, without interconnection to the south, its

2722 ability to absorb such quantities of surplus hydro-electric power would be greatly limited because it has such power in large quantities from its own plants at the same time that it is available from these interconnected plants.

Do you want the figures on it?

The Examiner: That answers my question.

The Witness: All right.

2723 *By Mr. Hamilton:*

Q. Is there anything unusual about the operation of these paper mills in terms of demands placed on the system requirements? A. It is very important that the power supply to a paper mill should be absolutely dependable. It is a difficult task to start a paper machine and it is very important after it is started that it be kept in operation until the run is finished.

Q. Do they operate on a 24-hour a day basis? A. Yes, they do. Most of the mills in the territory served by these companies, and I presume elsewhere, operate on a 24-hour basis as long as they have market for their output. It is considered a minor tragedy if something should happen to interrupt the operation of a paper machine while it is producing paper. The machines are very long and very complicated, and if a sheet is broken it ties up operations for sometime before it can be threaded through and started

2724 —1,302—

again.

For that reason the supply of uninterrupted service to paper mills is very important and as I will point out in sub-

sequent testimony, Wisconsin Michigan Power Company considers its obligation to the paper mills in the vicinity of Appleton so great that although it may be able to carry the entire load in the Appleton area by means of power delivered from the hydro-electric plants in the north, it still operates the Appleton steam plant as spinning reserve to pick up that load on a moment's notice if anything should happen to interrupt the performance of the transmission line.

The Examiner: That is an automatic arrangement? 2726

The Witness: Yes, it is. The plant is floating on the system.

By Mr. Hamilton:

Q. Is it an expensive operation to start these mills going? A. Yes, it is. It takes time and once a mill is started they continue operating as long as they can. An interruption in service to a paper mill would be expensive.

Q. Are there advantages arising out of the load diversification in the systems of the three companies? A. Yes, 2727 there are. There are substantial advantages. May I return for a moment to the northern territory? I would like to say something about the iron mines that are served there. Wisconsin Michigan Power Company serves a large number

of iron mines operating in the vicinity of Iron Mountain, Crystal Falls and Iron River. I don't know just how many mines up there are operating now. I do know, however, that there is much greater activity among them now than

2728 there has been in recent years. There is a much higher demand for iron and steel products. These mines are unusual with respect to the service requirements they place on the electric system serving them. They use tremendous quantities of power.

The principal use of power in the mines in the territory served by Wisconsin Michigan Power Company is that of pumping water to keep the shafts dry so the crews can work. These mines go down to depths approaching 2,000 feet and
2729 immense quantities of ground water flow into the shafts and tunnels and that water must be pumped out or it would quickly flood the workings.

Possibly the heaviest load that is carried by electricity is that of compressing air for operating machinery used in doing the actual mining operations, that is the drills for drilling the holes to place the blasts are operated with air. The cars which pull the ore away from the face after it has been blasted, back to the hoist, are pulled with cables by means of air-operated winches, and in some of the larger mines they have small excavators which they call mucking
2730 machines, which scoop up the ore after it has been blasted loose from the face, and load it into the cars which are pulled back to the hoist.

The air compressors that compress this air are driven almost without exception by synchronous motors. That is

—1,304—

a type of electric motor by means of which the power factor of the line serving the load can be controlled. These motors are usually over-excited, producing a leading power factor on the motor load, and off-setting the lagging power factor

on the hoist motor load, producing practically unity power factor on the entire load. Unity power factor is the most desirable relationship of voltage and current that could possibly be maintained on an electric system so far as efficiency of generation and transmission is concerned and the rates to these iron mines have a clause in them which gives the customer a lower demand charge in proportion to the extent to which his power factor is above 80 per cent.

In order to avail themselves of that reduced demand charge all of these companies operate their compressors on 2732 synchronous motors and use them as corrective power equipment.

Another relatively heavy use of electric service by these mines is that of hoisting the ore to the surface after it has been mined and loaded in the cars. The hoisting load——

Mr. Binford: (interposing) Mr. Examiner, the Commission has asked me to come down before them on another case for a few minutes. I wonder if we could take about a 15-minute recess?

The Examiner: Since it is almost 4:30 we will 2733 recess until tomorrow morning at 10:00 o'clock.

(Hearing adjourned at 4:10 p. m., to reconvene 10:00 a. m.)

2734

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

2735 THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1102,
Securities and Exchange Commission Building,
Washington, D. C.,
Tuesday, September 10, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

2736 Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

PROCEEDINGS

The Examiner: The hearing will come to order.

EDWARD H. SCHMIDTMAN resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Schmidtman, will you refer to Exhibit No. 34, Respondents' Exhibit No. 34? I believe you testified yesterday that the seven customers shown under the caption "Wis- 2738
consin Gas & Electric Company, Other Electric Utilities," were all municipal electric utilities. Do you want to correct that statement? A. Yes, I do. Those seven customers include six municipalities to which Wisconsin Gas & Electric Company sells energy, and Wisconsin Power & Light Company, a non-affiliated electric utility, with which the system of Wisconsin Power & Light Company interconnects at two points in Walworth County.

Q. Now, at the conclusion of your testimony yesterday afternoon, you were in the process of describing the electric service furnished by Wisconsin Electric Power Company to 2739
various iron mines in its territory. Will you proceed with that description? A. Yes. I was discussing the different ways in which the iron mines served by Wisconsin Michigan Power Company make use of electric service and was on the

question of hoisting the ore out of the mines.

All of the mines in this district are of the shaft type, none of them being open pit or strip mines, and the hoisting of the ore from the working levels to the surface consumes appreciable amounts of electric power.

2740 The loads imposed on the system of the company by this hoisting operation are somewhat variable and sometimes impose rather heavy demands on the company's system.

A fourth use of the electric energy made by the mines is that of lighting. It represents a relatively small proportion of the total amount of energy consumed by an iron mining customer. Because of the continuous loads which the mines have in doing their water pumping and air-compressing, many of these customers have load factors of 80 per cent. or
2741 higher.

One of the provisions of our rate is that the demand charge shall be lowered in proportion to the extent to which the load factor exceeds a certain set figure, so that with the combination of heavy use operating through the decreasing steps of the energy rate, and the benefit of the power factor correction, which I spoke of yesterday, as well as the load factor correction, these customers earn a very favorable rate for their power requirements.

Q. At the conclusion of yesterday's hearing I asked you whether there were any advantages arising out of the load
2742 —1,308—
diversification within the three companies and you answered that there were. Will you state what those advantages are? A. The advantages arising out of the diversification of loads served by the systems of the three companies operate to the benefit of both the companies and the customers. This diversification results in a much more steady type of load than would result from a situation where any one class of customers alone predominated on the system.

Because of this diversification resulting in more uniform demands, the companies are able to serve these com-

bined loads with facilities of lower generating and transmission capacity than they would be able to render the service with under other circumstances.

This means that each unit of generating capacity is able to serve more combined load because of the diversity in demands of the different classes of service.

Now, the diversification with respect to size of customers is very beneficial, particularly to the customers, because the high capacity equipment that is required to serve the large industrial plants can be operated at efficiencies much above 2744
that that could be attained in smaller units which would be required in serving customers with smaller loads.

In that manner, the customers, whose requirements are less than those of the industries, are able to share the benefits of the economies resulting from the larger plants and higher voltage lines and larger sub-stations which are re-

—1,309—

quired in serving the heavier demands of the larger customers.

Diversification of load resulting in diversity of demands 2745
and improvement of over-all load factor on the system is of distinct advantage in that it makes it possible for the utility system to render over-all service at lower unit cost and also makes it able to return those costs to the customers in the form of lower rates.

Now, the territory of the three companies operating in this area is unified with respect to power sources and is also unified to the extent that it is adequately and efficiently serving the composite loads represented by the entire service area.

2746 Q. Turning now to the gas business, does Wisconsin Electric Power Company do any gas business? A. No. It has no gas business at all.

Q. Both Wisconsin Michigan Power Company and Wisconsin Gas & Electric Company do, however? A. Yes, they do.

Q. Will you refer to Respondents' Exhibit No. 32 and indicate for us the gas service territory of the Wisconsin Gas & Electric Company? A. The gas service area of Wis-
2747 consin Gas & Electric Company is not outlined on Exhibit 32, but it generally follows the routes of the gas transmission lines shown on the map. —1,310—

These lines are indicated by the dotted lines which have been colored yellow. All of the gas service territory of Wisconsin Gas & Electric Company, except 84 square miles, is within the electric service territory of Wisconsin Gas & Electric Company and Wisconsin Electric Power Company.

Those 84 square miles which are outside the electric service area of those two companies, lie in the southwest corner of Kenosha County and the southeast corner of Wal-
2748 worth County. That portion of the gas territory of Wisconsin Gas & Electric Company is within the area in which Wisconsin Power & Light Company renders electric service.

Q. And in that territory is the line or lines indicated on the map as connecting with Genoa City? A. Yes. The area in which Wisconsin Gas & Electric Company renders gas service, generally follows the course of the transmission lines.

Beginning at Racine where the principal gas plant of Wisconsin Gas & Electric Company is located, the gas service territory extends south through and including Kenosha and then west over to Genoa City.

2749

It also extends from Racine north to the south limits of Milwaukee, and west and north around Milwaukee to the east line of Waukesha County, then, continuing east into and through Waukesha, then north through Pewaukee, and west

—1,311—

through Oconomowoc, continuing west to a point where a branch line runs north to the city of Watertown, continuing still further west with a branch extending to Lake Mills, and then south through Jefferson and Fort Atkinson to Whitewater.

2750

Another line runs west from Racine through Sturtevant, Union Grove, Waterford, and then northwest to Mukwonago, and then west through Eagle to the village of Palmyra.

The territory served by these lines includes the villages and cities through which the lines pass, and the adjacent rural territory in which service is rendered to customers who are within reach of the lines.

Q. And what is the square mileage of the gas service area served by Wisconsin Gas & Electric Company? A. It is 1,300 square miles.

2751

Q. And the population of that area? A. The population served in the gas service territory of Wisconsin Gas & Electric Company is 274,500. By "population served" I mean as in the case of the electric service area population, the population of the communities and rural districts to which gas service is available.

The average population density of this territory is 211 per square mile.

You will observe that that average falls between the average density of the electric service territory of Wisconsin Elec-

tric Power Company and the electric service territory of

—1,312—

Wisconsin Gas & Electric Company.

Q. How many communities are included in the gas service territory? A. There are sixty-one communities, of which eleven are cities and fifty are villages and townships. The principal cities in the gas service territory are Kenosha, Waukesha, Watertown, Lake Mills, Jefferson, Fort Atkinson and Whitewater.

2753 I have excluded Milwaukee from this list, although Wisconsin Gas & Electric Company does render gas service to a few customers along the south limits of the city of Milwaukee. Gas service in Milwaukee, in general, is rendered by another gas company.

The cities that I have just named all lie within the electric territory of Wisconsin Gas & Electric Company.

Q. Are all except Lake Mills served by Wisconsin Gas & Electric Company with electric service as well? A. Yes, they are. In the case of Jefferson, the electric service rendered by Wisconsin Gas & Electric Company is at wholesale for

2754 resale on the municipal distribution system. Wisconsin Gas & Electric Company also renders gas service in four cities which are in the electric service territory of Wisconsin Electric Power Company.

Those include Racine, Cudahy, South Milwaukee, and Oconomowoc.

—1,313—

Wisconsin Electric Power Company renders electric service in all four of these cities. In the case of Oconomowoc, however, the service is wholesale as the city operates a municipal distribution system.

 2755

Q. Was the company originally solely a gas company? A. Yes, gas. Prior to 1912 the name of the company was Racine Gas Light Company. It operated a gas manufacturing plant and a gas distribution system in the city of Racine, and also a gas transmission line extending from Racine to Kenosha.

In 1912, the name of the company was changed to Wisconsin Gas & Electric Company and at that time it was engaged solely in the manufacture and sale of gas. Later in 1912, the property of the Kenosha Gas & Electric Company 2756
was acquired. This property included a gas distribution system and an electric distribution system in and around the city of Kenosha.

In 1915, the territory was expanded by the acquisition of a gas plant and a gas distribution system in Watertown. In 1923, the property of the Waukesha Gas & Electric Company was acquired. This property included a gas plant and a gas distribution system and an electric power plant and distribution system.

This property rendered service in the city of Waukesha and in the surrounding area in Waukesha County. 2757

—1,314—

In 1926, Wisconsin Gas & Electric Company acquired the gas and electric systems previously operated by the city of Fort Atkinson.

This property included a gas production plant and a gas distribution system in addition to the electric property.

Q. Have you data as to the number of customers served with gas service by Wisconsin Gas & Electric Company? A. Yes, I have. In 1912, when Wisconsin Gas & Electric Com-

pany was serving in Racine and Kenosha only, that is after the acquisition of the Kenosha properties, the company was serving 11,820 gas customers and in that year it sold those customers 357,862 mcf.

By "mcf" I mean a thousand cubic feet. That is a standard unit of measurement of gas.

In 1926, the year of the latest acquisition, that of the Fort Atkinson property, the company was serving a total of 36,325 gas customers and its sales in that year amounted to
2759 1,482,099 mcf of gas.

From 1926 to the present date, no additional properties have been acquired and during that period the business of the gas system has been increased to where, at the end of 1939, it was serving 51,007 customers who consumed a total of 2,001,296 mcf of gas.

The gas sales of the system first exceeded two million mcf in 1929. Then they fell off to one and a half million

—1,315—

mcf in 1933, and have since climbed to—or rather they
2760 climbed to over two million in 1937, since when the trend has been slightly downward.

Q. What is the area in square miles of the territory served by Wisconsin Michigan Power Company with gas service? A. Wisconsin Michigan Power Company renders gas service in an area of 61 square miles. This area includes the cities of Appleton, Neenah, and Menasha, and a band of suburban territory lying along the gas transmission line connecting the cities.

The transmission line is shown by the line of dashes appearing on Exhibit 32 between Appleton and Neenah.

2761

Q. What is the population of the area served with gas service? A. The population of the gas service territory of Wisconsin Michigan Power Company is 53,188. The three cities in that territory have a total population of 50,000 and the remaining population of 3,188 is located in the suburban territory lying between the cities.

This entire gas service territory is within the territory in which Wisconsin Michigan Power Company renders electric service.

2762

Both Appleton and Neenah receive retail electric service from the company, but the city of Menasha has its own electric system to which the company sells energy wholesale.

—1,316—

Q. Have you data on the number of customers served by Wisconsin Michigan Power Company with gas service? A. In 1923, the year in which continuously available records begin, the gas system was serving 6,583 customers and sold 174,986 mcf. The number of customers applies to the end of the year 1923 and the sales within the year.

In 1923, this system was operated by Wisconsin Traction, Light, Heat & Power Company.

2763

Q. That is a predecessor company of the Wisconsin Michigan Power Company, is it? A. Yes, it is.

In 1927, the year in which Wisconsin Michigan Power Company came into existence, the system was serving at the end of the year 8,258 customers who consumed 232,909 mcf. of gas. In the year 1930, the system reached its maximum annual sales.

At the end of that year it was serving 9,262 customers and the total sales amounted to 264,857 mcf. Since that time

the volume of sales has gradually declined, although the number of customers hasn't changed materially.

At the end of 1939, the system was serving 9,239 customers, who consumed 207,829 mcf. of gas.

The gas business on this system is continuing to decline.

Q. Previously, you located very briefly the transportation territory of the Milwaukee Electric Railway and Transport Company, the transportation subsidiary of Wisconsin

—1,317—

2765 Electric Power Company. Will you be a little more specific in locating that territory by names of towns served? A. The Milwaukee Electric Railway and Transport Company now renders street railway and auxiliary gasoline feeder bus service in the city of Milwaukee, the village of Shorewood, the village of Whitefish Bay, the village of Fox Point, the city of Wauwatosa, the city of West Allis, the city of West Milwaukee, the city of Cudahy, and the city of South Milwaukee.

Q. All those towns are designated, are they, on Exhibit No. 32? A. Yes, they all appear.

2766 The company also renders electric trolley bus transportation service in the city of Milwaukee. Our trolleys are overhead, however, rather than underground as you have them here with your street cars in Washington, and that trolley bus service requires double trolleys, inasmuch as the busses travel on rubber tires and have no connection with the ground.

The company also operates an interurban electric railway system with lines reaching from Milwaukee to Port Washington, from Milwaukee to Watertown, from Milwaukee to Hales Corners, and from Milwaukee to Kenosha.

2767

The Milwaukee-Port Washington line, until quite recently, extended as far north as Sheboygan, Wisconsin, which does not appear on the map. It is located a few miles

—1,318—

north of Weedens, which is the point at which the northernmost railway sub-station of the company is situated.

Sheboygan is on the shore of Lake Michigan, east and a trifle north of Plymouth.

The service was recently cut back to Port Washington, due to poor operating results, and bus service was substituted from Port Washington to Sheboygan. 2768

The interurban cars now run as far north as Port Washington and turn around at that point.

The Milwaukee-Watertown line is still in existence but the rail service extends west only as far as Oconomowoc. Beyond Oconomowoc transportation service is rendered by means of gasoline busses and although the rail service from Oconomowoc to Watertown has been discontinued, the tracks haven't yet been removed.

The line to Hales Corners, which is just a few miles southwest of Milwaukee, formerly extended over two branches, one leading to Mukwonago and East Troy, the latter city being located in Walworth County, and the other extending to Burlington, which is located in the southwest corner of Racine County. 2769

Both of these branch lines have been abandoned and now the rail service extends only as far as Hales Corners. In abandoning the rail service to East Troy and to Burlington,

—1,319—

the company would have been required by the Public Service

Commission of Wisconsin to substitute gasoline bus service for the convenience of the public, but it happened that another bus line which was operating in this vicinity was willing to take over those routes and it is now rendering service that was previously rendered by the interurban rail lines.

The rail line to Kenosha passes through the cities of Cudahy and South Milwaukee, as well as though Carrollville, and through the city of Racine. This line is one of
2771 the best operating lines of the entire interurban system, and there are no plans in mind at present for discontinuing any of that service.

Q. Does Wisconsin Gas & Electric Company do any transportation business? A. Yes; Wisconsin Gas & Electric Company operates a number of electric trolley busses in the city of Kenosha. The service rendered there is purely an urban transportation service. It has no interurban lines and has no transportation service in any other city.

Q. And Wisconsin Michigan Power Company, does it have any transportation business? A. Yes, Wisconsin Michi-
2772 gan Power Company now operates gasoline busses in the city of Appleton and between Appleton and Kimberly. Wisconsin Michigan Power Company formerly operated street cars in

Appleton and an interurban rail line to Kimberly, but the rail service was discontinued and gasoline bus service substituted.

Q. Which companies do a steam business? A. Wisconsin Electric Power Company does some steam heating business. The area in which it renders steam heating service is in the

heart of the business district of the city on both sides of the Milwaukee River.

Most of the service is rendered to large office buildings, hotels and public buildings.

Wisconsin Gas & Electric Company also does a steam heating business which is of rather small magnitude. These operations are carried on entirely in the city of Waukesha and are an outgrowth of the business that was acquired when the property of the Waukesha Gas & Electric Company was purchased. 2774

Wisconsin Michigan Power Company does no heating business.

Q. So far your testimony has related to the outlines of the territory served by the respective companies in the various businesses in which they engage.

Turning now to the actual physical properties of the companies, would you state what the aggregate book value of the investment of Wisconsin Electric Power Company, Wisconsin Gas and Wisconsin Michigan Power Company is on electric property? A. Yes, the total book value of the

—1,321— 2775

electric plant in service of the three companies at the end of 1939 was $140,315,612.00.

Q. And what are the major classifications of properties? A. The major classifications of the property include twenty power generating stations with a total rated generating capacity of 539,080 kilowatts at the present time.

Q. By that aggregate figure you mean to include only plants now in operation and available or available for operation, and you are excluding, are you not, projected plants

2776 *Edward H. Schmidtman—By Respondents—Direct*

or plants under construction? A. Yes, that is right. This generating capacity represents the installed rated generator capacity now in place and either in operation or available for operation at the present time.

The second general classification of electric properties is the transmission system which comprises 1,896 miles of line interconnecting the power plants and feeding the distribution system.

The transmission system includes thirty sub-stations with
2777 a combined installed capacity of 702,025 k. v. a. The distribution system of the three companies includes 10,590 miles of pole line, 204 miles of underground lines, 170 sub-stations, with an aggregate installed transformer capacity of 573,486

—1,322—

k. v. a. and 43,532 line transformers whose combined capacity is 422,977 k. v. a.

Q. All figures which you have just given relating to electric plant and property are figures for the combined Wisconsin Michigan group, are they not? A. Yes, they are.

Q. What are the generating stations of the Wisconsin
2778 Electric Power Company? A. Wisconsin Electric Power Company has five generating stations, having a combined installed generator capacity of 479,500 kilowatts. These are all steam plants.

In order of size their individual capacities are as follows:

Lakeside Plant, 310,800 kilowatts; Port Washington, 80,000 kilowatts; Commerce Street Plant, 51,500 kilowatts; Racine Plant, 23,500 kilowatts; and the East Wells Street Plant, 13,700 kilowatts.

Q. Will you now describe the East Wells Street Plant? A. The East Wells Street Plant is the plant in which the newest boiler and the newest generating unit on the system are installed.

The plant contains only this one generating unit which is a turbo-generator rated at 13,700 kilowatts.

The steam turbine operates at a steam pressure of 640 pounds per square inch, and a steam temperature of 825 degrees Fahrenheit.

—1,323— 2780

The boiler plant burns pulverized coal exclusively. The generating unit went into service in 1939. This plant is located in downtown Milwaukee in the heart of the business district. It is situated on the east bank of the Milwaukee River which furnishes water for cooling the condenser.

I might add here, that boiler make-up water is taken from the municipal water system. The plant furnishes steam for the steam heating system in the East Side business district and also generates electrical energy for distribution in the downtown area.

The plant is in regular operation and during the heating 2781
season it is in continuous operation. The steam, which is delivered to the turbine at 640 pounds per square inch, is expanded in passing through the turbine and is exhausted at twenty-pounds pressure into the high pressure heating system.

From there it is transmitted through the heating mains and service connections to the heating customers.

Now, the plant also operates during seasons of the year outside of the heating season. If it weren't capable of

doing that, it would have to stand idle during the entire summer.

In order to make it unnecessary to shut the plant down or to operate uneconomically when the heating system require-

—1,324—

ments . low, the plant has been equipped with a condenser into which the turbine exhausts when the exhaust steam is not needed for the steam system.

This condenser, as I explained, is cooled by water pumped
2783 in from the Milwaukee River. The present boiler went into service before the turbo-generator was completely installed. The boiler was completed and began operating in 1938.

It took over the load, that is the steam heating load, of six old boilers located in what we previously called the Oneida Street Plant, which is in a building adjacent to the building in which the new boiler plant is located.

In 1938, the boiler rendered steam heating service only, but in 1939, when the turbo-generator went into operation, then the boiler plant delivered steam to the turbine and through it to the heating system.

2784 The six boilers in the old Oneida Street Plant which were replaced by this new boiler, originally served the Oneida Street generating station, whose generating equipment has since been taken out of service and replaced with a new unit.

The old Oneida Street Station was the first central station in Milwaukee and when it went into operation, it took over the loads of a number of small scattered, inefficient plants, which had been acquired by Wisconsin Electric Power Company during the process of integrating the isolated systems then operating in the Milwaukee district.

—1,325—

2785

The original boiler plant and the generating equipment in the Oneida Street Plant operated until 1930, furnishing steam and electricity for the same area which is now served by the new plant.

In 1930 the generating equipment was taken out of service but the boilers were continued in service until 1938 when they were relieved of their load by the new boiler plant.

The reasons for making the installation of this new boiler, and the new turbo-generator, at this location, were two-fold: First, the load on the steam heating system in the 2786
East Side business district had grown to a point where the old boilers were incapable of carrying it safely and efficiently; and, second, the requirements for electrical service in the downtown area had also increased to such an extent that there was definite need for additional generating capacity in that district.

The new plant which was installed at a cost of about $1,800,000.00 meets both these requirements. It realizes the economy that can be achieved from using steam, first, for generating electricity, and then for serving steam heating customers. 2787

The use of steam for generating electricity, first, does not detract from its usefulness for heating purposes. It simply involves a matter of giving the steam more heating energy than it needs for heating purposes and taking that heat

energy out of it by electrical generation.

As I have explained, this steam is delivered to the turbine at 640 pounds and then is expanded to twenty pounds where it goes into the heating system. At that point it is

just as useful for heating purposes as it would be if it were generated in a boiler plant which generated steam at twenty pounds.

The economy that is realized through this joint operation arises from the fact that the heat which is put into the steam above that remaining when it goes into the heating system, is available for electric generation, and the residual heat that is left in the steam when it is exhausted, is still available for heating purposes.

2789 Q. You said the installation of the unit in East Wells Street resulted in savings. Is that savings which can be translated into dollars and cents? A. Yes, it is. The saving which I was speaking of is one that is inherent in the type of operation that is practiced at the plant. We have made no attempt to evaluate that saving but a more measurable saving has been made by the new installation in comparison with the cost of operation experienced in the old boiler plant and in the other generating stations of the company as a whole.

During the twelve months ended February, 1940, the
2790 steam produced for heating purposes and the electricity produced for distribution at the new East Wells Street Plant

—1,327—

were produced at a cost of approximately $130,000.00 less than the cost would have been had that same amount of steam been generated in the old East Wells boilers and the same amount of electricity generated in all the other plants of the companies on an average cost basis.

Those figures don't purport to show the saving resulting from the combined operation of electric and steam heating uses, but rather to show the savings realized from the plant

because of its higher economy than that of other facilities of the company.

Q. Will you describe the Commerce Street generating station? A. The Commerce Street generating station now has an installed generator capacity of 51,500 kilowatts. That is 6,400 kilowatts less than the installed capacity was on December 31, 1939.

I point that out because I have already given a figure representing the total installed generator capacity of all companies as of the present time and subsequently I will use 2792
a figure representing the total installed generating capacity of the three companies of the Wisconsin Michigan group at the end of 1939 and I wanted to point out this change in the capacity of the Commerce Street Plant so there would be no apparent discrepancy in my figures.

—1,328—

The present capacity of the plant is made up of seven generating units. Two of them are rated at 2,000 kilowatts each and generate 600-volt direct current energy.

These units are driven by vertical cross compound Corliss engines which operate at a steam pressure of 180 pounds per 2793
square inch, and a steam temperature of 400 degrees Fahrenheit.

These units went into service in 1905 and are the remaining two of four such units which were installed at that time.

Previously, there were also four other engine-driven units rated at 1,500 kilowatts each and which generated 25-cycle current, but those have since been removed.

Two of the present units in the Commerce Street Plant are rated at 7,500 kilowatts each. They are turbine-driven generators which generate energy at 25 cycles.

2794 The turbines operate at a pressure of 1.3 pounds gauge per square inch, and a temperature of 220 degrees Fahrenheit. They were installed in 1911. These units were installed for two reasons.

First, there had been a rapid increase of load in the area served by the Commerce Street Plant; and, second, the eight engines which were then in service had been installed and designed to operate so as to exhaust their steam into the heating system. —1,329—

2795 It was found, after operating a short period of time, that the eight engines produced more exhaust steam than the heating system required and in order to carry the electrical load on the generators, it was necessary to exhaust this steam into the atmosphere and waste the heat energy contained in it.

In order to supply part of the need for increased electric generating capacity and to supply the means of utilizing the steam being exhausted from the engines in excess of requirements of the heating system, these low pressure turbines were installed. They take the steam at a gauge pressure of 1.3 pounds per square inch and exhaust it into condensers which
2796 are cooled with water pumped in from the Milwaukee River.

I should have explained that Commerce Street Station is located on the Milwaukee River on the opposite side and somewhat upstream from the East Wells Street Plant.

The heating system which is served by the Commerce Street Station is entirely on the west side of the Milwaukee River. There is a connection through between the plants, but normally the East Wells Street Plant serves the east side heating load and the Commerce Street Plant serves the west side heating load.

In 1911 there was also installed one unit rated at 14,000 kilowatts. This unit is turbine driven and generates 60-cycle

—1,330—

alternating current energy.

The turbine operates at a throttle pressure of 200 pounds per square inch and a throttle temperature of 450 degrees Fahrenheit.

Another similar unit was installed the following year—that is, in 1912. These two units were installed purely for the purpose of keeping the plant ahead of load requirements 2798 in the area it was serving.

In 1913 another 60-cycle turbo-generator was installed, having a rated capacity of 4,500 kilowatts. In the same year there was also installed in the Commerce Street Plant a small 250-volt direct current unit which was moved over from the old Oneida Street Plant across the river.

That unit is no longer in service, but I mention it here to support the statement that the maximum installed capacity of the Commerce Street Plant was reached in 1913. That capacity was 61,900 kilowatts.

The Commerce Street generating station was the com- 2799 pany's principal power plant for a number of years. The entire capacity of 61,900 kilowatts remained in service until 1933 when two of the four original vertical engines were removed with their generators—no, that is not correct. In 1933, two of the four original engines were converted to single expansion operation in order to provide more steam for the heating system.

—1,331—

That reduced their rating from 1,500 kilowatts each to 900 kilowatts each. The use of 25-cycle service on the company's system was being reduced according to a program

carried out by the company, and as a result of that program, one of the four original units was taken completely out of service in 1937, and the following year one of the single expansion units was removed, and then the four hundred kilowatt unit, which I mentioned as having been moved over from Oneida Street, was also taken out in 1939.

The continued upward trend of loads in the downtown area of the city, accompanied by the continued increase of the heating load in that district, has made it necessary for
2801 still further additions to be made to the plant.

Plans have been laid for a new high-pressure boiler and turbo-generator to be installed in the Commerce Street Station. Authority was obtained from the Public Service Commission of Wisconsin and work on the installation of the boiler plant and turbo-generator unit was begun in 1939.

This boiler plant is being installed in a new section of the building on the north end of the existing power plant building, but the generating unit is going to be placed in the existing power plant building and room for it is being provided by the removal of the two remaining engine-driven
2802 —by the removal of two of the remaining engine-driven units, and two of the 2,000 kilowatt engine-driven units.

—1,332—

Those removals which were made in 1939 represent a total of 6,400 kilowatts and lowers the plant capacity to its present figure of 51,500 kilowatts.

Q. Giving effect to the completion of the operation of the new unit, what would be the rated generating capacity of the Commerce Street Plant? A. The rated generator capacity of the plant, after the new 35,000 kilowatt unit is in service, will be 86,500 kilowatts.

2803

The new boiler will generate steam at a pressure of 1,230 pounds—that is, it will deliver steam to the generating unit at 1,230 pounds and a temperature of 900 degrees Fahrenheit.

The furnace will burn pulverized coal exclusively and the boiler plant will have a rating of 375,000 pounds of steam per hour.

The turbo-generator will be of the extraction condensing type. By that I mean that it will be designed to operate in such way that steam can be extracted from the turbine at various stages of expansion, such extracted steam to be 2804 used in the heating system.

The turbine can also be operated to discharge its exhaust into a condenser, in which case the maximum amount of energy in the steam will be utilized in generating electrical power. —1,333—

The condenser will be cooled by circulating water drawn from the Milwaukee River. When the unit is carrying an electrical load of 35,000 kilowatts, it will be capable of delivering 100,000 pounds of steam per hour for heating purposes. The maximum extraction that can be made will be 240,000 pounds per hour, at which time the turbine will be 2805 capable of carrying the load of 24,000 kilowatts on the electrical generating end of the unit.

The maximum extraction of 240,000 pounds per hour will furnish steam equal to the steaming capacity of the original eight boilers installed in the Commerce Street Plant.

Those old boilers will then be taken out of service and will be re-rated to operate at a lower pressure and will be used purely as stand-by steaming capacity for the heating system.

2806

They are not to be dismantled immediately.

Now, I mentioned that the boiler will burn pulverized coal. The boiler installed in the East Wells Street Plant also burns pulverized coal and it replaces the old boilers in the Oneida Street Plant which were used in 1919 to conduct a series of pioneering experiments in the use of pulverized coal in central station boilers.

Those experiments were conducted by the combustion engineering corporation, representatives of the United States
2807 Bureau of Mines and representatives of Wisconsin Electric

—1,334—

Power Company.

They were quite revolutionary in the field of power generation and the results indicated considerable increases in efficiency in boiler operation. Some of the tests that were conducted at that time showed improvements of four points over the highest efficiencies theretofore obtained in any central boiler plants.

As a result of those experiments which were the first ones carried out on that scale and carried out to an extent
2808 that supported conclusions to the effect that the use of pulverized fuel was practical in central station boilers, really paved the way for the design of the modern pulverized fuel boilers which are being installed in some of the modern generating stations today.

(Discussion off the record.)

The Examiner: I think this is a good point to have a recess. We will take a five-minute recess.

(Whereupon a short recess was taken.)

The Examiner: All right.

The Witness: Continuing with the discussion of the Commerce Street Power Plant, I would like to point out that the reasons for the current additions being made to the plant are the same as those for which the new unit and boiler plant were installed in the East Wells Street Station—that is, increased demand for electric service and increased require-

—1,335—

ments for heating service in the business district 2810
of the city of Milwaukee.

Before deciding to make the installation at Commerce Street, however, extensive investigations were made to ascertain the best means of meeting those requirements.

Of course, the requirements for more steam in the heating area could be met only by boiler plant capacity installed within reach of that system and the studies contemplated boiler plant installation purely for the purpose of furnishing steam at that location and the possibility of installing additional electrical 2811
generating capacity at various other points on the company's power system.

One of the points considered for the location of the generating capacity was Kenosha because Racine and Kenosha are now served very largely by a high-voltage transmission line which I will describe later, and it was felt there might be justification for the purpose of increasing reliability of service or rather reducing the likelihood of interruptions in the Racine-Kenosha

2812 *Colloquy*

district by installing generating capacity on that part of the system.

In spite of that advantage, however, it was found that the economies that could be achieved by the combined operation for generation and heating purposes, that the decision to install the boiler plant and unit at Commerce Street was reached.

—1,336—

2813 The present installed capacity of the Commerce Street Plant, excluding the new unit which is going in, is 51,500 kilowatts, but the plant is incapable of carrying that great an electrical load during the peak load season.

The reason for this is that the requirements of the heating system for steam utilize such a portion of the boiler plant capacity that the boilers are unable to furnish enough steam in addition to that to carry the electric generating units at full load.

2814 We consider the dependable heat load capacity of the Commerce Street Plant during the winter season, when the heating loads were high, to be 28,000 kilowatts.

When the current additions have been completed, the total available boiler capacity will be appreciably increased and the dependable generating capacity of present equipment will be increased to about 30,000 kilowatts.

When the new unit is added, representing an additional 35,000 kilowatts, the total dependable capacity of the Commerce Street Plant will be 65,000 kilowatts.

That figure should be distinguished from the total installed capacity of 86,500 kilowatts at that time.

By Mr. Hamilton:

Q. Before leaving the Commerce Street Plant, I don't believe you have told us the steam pressure and the steam temperature at which the 4,500 kilowatt unit installed in

1913 operates. Will you give those figures? A. Yes, I will. 2816
I must have overlooked that information.

The 4,500 kilowatt unit installed in 1913 is a turbine-driven generator which generates 60-cycle alternating current energy. The turbine operates at a throttle pressure of 180 pounds per square inch and a steam temperature of 450 degrees Fahrenheit.

Q. In this plant, taking into account the new addition, there appear to be variations in steam pressure as between the respective unitsofrom 1.3 pounds to 1,200 pounds in the case of the new unit. Can you explain the wide variation in addition to your preliminary explanation of the 1.3 steam 2817
pressure? A. The original generating units in the plant operated at 180 pounds pressure. That was considered a reasonable and economical operating pressure for engines of that type at that time, and the boilers were designed to deliver steam at that pressure.

The 7,500 kilowatt units, as I have explained, were designed to operate at the unusually low pressure of 1.3 pounds per square inch in order to utilize the exhaust steam from the eight engines then in service.

2818 *Edward H. Schmidtman—By Respondents—Direct*

The 200-pound pressure units installed in 1911 and 1912 are considered to operate at essentially the same pressure as

—1,338—

the eight engines previously installed and the 4,500 kilowatt unit subsequently installed. The difference of twenty pounds doesn't throw the two into different general pressure classes.

Now, the decision to install the new boiler and turbo-generator to operate at 1,230 pounds pressure is based on
2819 experience that has subsequently been gained in the installation and operation of units on the high-pressure cycles.

There is considerable economy to be realized through the use of high pressures and high temperatures, inasmuch as there is a certain residual heat in the steam when it is discharged from the bottom stage of the turbine. That amount of heat can not be reduced below a certain practical minimum.

There is also a certain amount of heat lost through radiation. The radiation losses will naturally vary somewhat with the temperature and pressure, but they are kept to
2820 practical minimum values by insulation.

Now, then, above those relatively fixed losses is the range in which the heat which is put into the steam is useful in generating mechanical power in the turbine and subsequently electrical power in the generator, so that the more heat energy that is stored in the vapor above the margin which is certain to be lost, the greater is the percentage of useful heat in the steam.

Now, the art has been developed to the point where pres-

—1,339—

sures are now in the 1,200 to the 1,300 pound range. I have no doubt that we will have still higher pressures in the future, unless some entirely revolutionary method of converting heat to electricity is discovered and developed to a practical basis.

It is expensive to use high pressures and high temperatures. Operating difficulties not encountered in low-pressure and low-temperature boilers occur regularly in these high pressure units. Difficulties are encountered in the operation of the turbines, but in spite of those difficulties and in 2822
spite of the higher investment required because of the more difficult and more exacting construction of the equipment, the additional economy justifies the expenditure in instances where the fuel cost is not so low that the saving does not off-set the additional cost.

Our companies are in an area where fuel costs are somewhat higher than they are in certain other parts of the country and those higher fuel costs make it economical for us to use the high pressures and the high temperatures when the loading conditions and other operating conditions lend themselves to that type of operation. 2823

These decisions to go to the higher pressures were not made lightly. Most extensive studies were made and, as I will point out when we come to the Lakeside Plant, we have had as great experience as any utility operators in the

—1,340—

country in the operation of high-pressure and high-temperature equipment.

Q. Will you now describe the Racine Power Plant? A. The Racine Power Plant is a steam generating station lo-

cated in the city of Racine on the shore of Lake Michigan near the mouth of the Root River.

It has an installed electrical generating capacity of 23,500 kilowatts, consisting of three turbo-generator units which generates 60-cycle alternating current energy.

The units all operate at 200 pounds pressure and 530 degrees Fahrenheit temperature.

The boilers which supply the steam for the turbines are stoker-fired. The present units in the plant are the ones
2825 which remained in place after the period of additions and removals which the plant has gone through.

The plant was acquired by Milwaukee Light, Heat and Traction Company, a non-operating affiliate of Wisconsin Electric Power Company, in 1919. At that time it was a part of the property—I should say it was acquired from, not by, Milwaukee Light, Heat and Traction Company in 1919. It was a part of the utility operating property of Milwaukee Light, Heat and Traction Company at that time.

The plant was constructed by a previous owner and was acquired by Milwaukee Light, Heat and Traction Com-
2826 pany in 1899. Its original function was to generate energy at

600 volts direct current for use of the street railway system in Racine.

The owner of the plant also operated the railway system at that time. After it was acquired by Milwaukee Light, Heat and Traction Company, it was expanded in order to carry the increasing loads on the railway system and by 1910 the plant capacity had increased to 3,500 kilowatts of 600-volt direct current generating capacity.

Additional units were installed and other units were removed, so that at the present time the three units consist of one rated at 35,000 kilowatts, which was installed in 1915——

Q. (Interposing) 3,500. A. You are right. 3,500 kilowatts —(continuing) which was installed in 1915, one rated at 10,000 installed in 1917, and one rated at 10,000 installed in 1919, making a total present installed generator capacity of 23,500 kilowatts.

The Racine Plant is not in regular electric operation. The 2828
boilers are in continuous operation, however, and furnish steam for the operation of the gas production plant of Wisconsin Gas & Electric Company which is located nearby.

The electrical generating equipment is operated periodically, purely for the purpose of making sure that it is in operating condition and is available to pick up load in case of an emergency on the system.

—1,342—

Being located in Racine, the plant represents not only available reserve capacity for the entire system, but it also constitutes a valuable stand-by for guaranteeing continuity 2829
of service in the Racine and Kenosha district in case of an outage on the transmission line from Lakeside which furnishes most of the power consumed in that area.

Q. Its maintenance as reserve capacity is necessary for the Wisconsin Electric System? A. Yes, it is. By that I mean it is an essential and important part of the reserve capacity of the system. It is always included as available capacity in computations pointed toward the determination of whether our capacity is sufficient to carry our loads with an adequate margin of reserve, and inasmuch as it is recog-

2830 nized as available reserve in such analyses, and is considered reserve in operating the power generating facilities of the company, it is kept continuously ready to start up and carry load.

The units are not kept spinning all the time, however, and it would take a short time to get the units warmed up so that they could carry load. It is still available and we consider it as load reserve.

Q. What is the function of the steam which that plant
2831 furnishes to the Racine Gas Works of the Wisconsin Gas & Electric Company. A. The steam that is used in the gas works is used for quenching purposes and for heating the

—1,343—

gas holders. They are the water sealed type holders and the seal must be kept free from ice, otherwise, the holders would be frozen tight and wouldn't operate in the winter time.

During our extreme winters we have ice on open streams and open bodies of water that sometimes reaches a thickness of two or three feet and the water seal on a gas holder will quickly freeze up and then the top of the holder wouldn't be
2832 able to rise and fall as it received and delivered gas.

Q. Will you describe the Lakeside Generating Station? A. The Lakeside Generating Station is the largest power plant owned and operated by Wisconsin Electric Power Company, and is also the largest power plant in the combined systems of the three companies of the Wisconsin Michigan group.

It has a total installed generator capacity of 310,800 kilowatts. This capacity comprises twelve turbo-generator units, all of which generate 60-cycle alternating current. All of the boilers in the boiler plant burn pulverized coal exclusively.

The oldest unit in the plant is one rated at 20,000 kilowatts which was installed in 1920. It operates at a throttle pressure of 290 pounds per square inch and a temperature of 700 degrees Fahrenheit.

The next unit installed went into service in 1921. It is

also rated at 20,000 kilowatts and also uses steam at 290 pounds pressure and 700 degrees.

The third unit which is rated at 30,000 kilowatts was installed in 1922. It operates at the same pressure and temperature as the two 20,000 kilowatt units. 2834

Two more 30,000 killowatt units went into service in 1924, operating at 290 pounds pressure and 700 degrees.

In 1926, a fourth 30,000 kilowatt unit operating at the same pressure and temperature was installed.

Also in 1926, there was installed one unit rated at 7,700 kilowatts which operated at a throttle pressure of 1,230 pounds per square inch and temperature of 750 degrees.

In 1928, one 60,000 kilowatt unit and one more 7,700 kilowatt unit were installed.

The 60,000 kilowatt unit operated at 290 pounds pressure and 700 degrees, while the 7,700 kilowatt unit operates at 1,230 pounds and 750 degrees. 2835

In 1930, another 60,000 kilowatt unit operating at 290 pounds, and 700 degrees, as well as two 7,700 kilowatt units, operating at 1,230 pounds throttle pressure and 750 degrees temperature, were installed.

The Lakeside Plant is located at St. Francis which does not appear by name on Exhibit 32. The location of the plant is shown by the name Lakeside Power Plant, and is about one

2836 mile south of the city limits of Milwaukee on the shore of

—1,345—

Lake Michigan.

Construction of the Lakeside Plant was first considered in 1915. I have described how the increasing load requirements on the system caused the company to make successive additions in the Commerce Street Plant and you will recall that the Commerce Street Plant first reached its ultimate capacity in 1913.

2837 Only two years later the company considered the construction of another power plant. Plans were laid and designs were drawn for the original Lakeside Plant in 1915 and 1916, but when the United States entered the World War, conditions became such that it was difficult to finance the construction of a project of that magnitude and the plans were temporarily shelved.

The loads continued growing, however, during that period and the company resorted to obtaining power from all possible sources, including the purchase of power from isolated private plants located in the territory.

2838 At the end of 1919, however, the demands were so nearly equal to the total capacity available for generating power that it wasn't possible to postpone the construction of the plant any longer.

The original plans were revived and revised. Construction was begun on the plant in 1920.

Now, the studies that were originally made in 1915 to de-

—1,346—

termine what size plant should be built and where it should be located, indicated that it would be desirable to build a

new plant rather than install additional capacity in plants then in operation.

The loads on the system south of the city of Milwaukee had been growing substantially in the communities of Cudahy and South Milwaukee and down in Racine and Kenosha. For that reason a location south of the city of Milwaukee received preference.

Another point which led to the decision to locate the Lakeside Plant where it was located, is the availability of an unlimited supply of cool water in Lake Michigan. In a 2840
modern steam plant, somewhere between 700 and 900 tons of water are pumped through the condensers for every ton of coal that is burned and with a plant of the size which Lakeside was expected to ultimately reach, a supply of cold water was quite essential.

Lakeside was not located on the lake in order to receive coal from lake boats, but it was located there largely because of the presence of the plentiful supply of cooling water and it was located south of the city because of the tendency of the loads at that time to be developing in that direction.

Between 1915 and 1930, when Lakeside went into con- 2841
struction, the experiments in pulverized fuel which I previously mentioned, were conducted at the Oneida Street Plant,

—1,347—

and the possibility of using such fuel successfully in central station boilers had been demonstrated, so the plans for the Lakeside Plant which had previously been prepared were revised to provide for the exclusive burning of pulverized fuel in the boilers in that plant.

The first section that went into operation was completed late in 1920 and it was the first plant in the world of that

capacity to utilize pulverized coal exclusively as a fuel. The decision to use pulverized coal was made quite widely known through its revolutionary nature and renowned engineers and well established engineering periodicals were unanimous in the opinion that it would be a dismal failure.

We have quite a bibliography in our plant department of articles and quotations by people who were unquestionably authorities in the field of power generation who felt that the company was being most unwise in making such an invest-
2843 ment in such a revolutionary development.

That decision required considerable fortitude but it was made. The plant was built and went into operation and its subsequent history has demonstrated that that was one of the pioneering achievements in the field of power generation.

Now, when I speak of pulverized coal, it might be illuminating to tell just a little what it is like. Pulverized coal as burned in modern pulverized fuel boilers is coal that has

—1,348—

been ground to a fineness such that approximately two-thirds of it will pass through a sieve with two hundred openings per
2844 inch, or forty thousand openings per square inch. That is, there are two hundred wires in each lineal inch.

That would mean that there are two hundred times two hundred which would be 40,000 openings in one square inch of the screen. Approximately two-thirds of the pulverized coal will pass through a screen of that fineness.

A screen that fine will hold water if it isn't under pressure. When mixed with air, this extremely fine coal dust forms an explosive mixture and if it is ignited under certain conditions it will explode with the violence of gun powder

2845

and that characteristic of the fuel was one of the reasons why the predictions were so unanimously in the direction of failure.

Pulverized fuel had previously been used quite extensively in such operations as cement kilns and refractories and other operations where the heat of the combustion was consumed directly in the manufacturing process without first going through the medium of steam, but never before had it been used successfully on that scale in the generation of steam in central station boilers.

2846

The pulverized coal is mixed with air by means of carefully controlled apparatus and is supplied to the boilers as

—1,349—

a mixture of air and coal in which the air content is not quite sufficient to accomplish complete combustion. It is blown in. It is handled by air fans and blown into the boiler through nozzles.

When it reaches the boiler it encounters an uprising current of air which is furnished by other fans, and which furnishes the quantity of air required to complete the combustion.

2847

The nature of the fuel and the ease of controlling the delivery makes its operation very flexible. It also results in more nearly complete combustion of the coal—that is, less of the fuel value is wasted in the furnace, and it lends itself to more completely automatic operation, eliminating or minimizing the human element, and facilitating accurate adjustment and control of the delivery of coal and air.

During the first months of operation of the Lakeside Plant, difficulties were encountered, as would be expected

in a plant as revolutionary as that, and as a result of those difficulties, the unit heat consumption per kilowatt hour of net output was somewhat above 20,000 B. t. u.

By B. t. u. I mean British Thermal Unit, and in my subsequent testimony I will use the term B. t. u. with that meaning.

By the middle of 1921, the plant was operating quite smoothly. Most of the difficulties had been fairly well ironed

—1,350—

2849 out and the heat consumption had been reduced to 19,000 B. t. u. per kilowatt hour of net output.

At this point I should also explain what I mean by net output. The total energy generated in a steam generating station may be measured at the terminals of the generator. That energy represents the over-all electrical energy produced in the plant.

Some of that energy is consumed in operating the plant, itself, in driving—in the case of Lakeside—the coal conveyors, the pulverizing mills, the draft fans, the boiler feed water pumps, the condensing water pumps, and various

2850 other auxiliary equipment in the plant.

After the consumption of those auxiliary uses has been deducted from the gross generation of the generators, the remaining difference which is available for delivery to the transmission or distribution system and is measured by the kilowatt hours on the plant switchboard is what I mean by net kilowatt hour output.

System loads continued to grow and, as I have previously pointed out, a 30,000 kilowatt unit was added in 1922 bringing the total installed capacity to 70,000 kilowatts.

2851

In 1924, two more 30,000 kilowatt units were added and a second section of boiler plant was installed. Up to this time, the first section of boiler plant had been able to supply all of the generators installed in the plant, but when the

—1,351—

two 30,000 units were installed in 1930, it was necessary to add to the boiler plant and at that time a second contribution to the field of power generation was made at the Lakeside Plant.

2852

Q. Did I understand you to say this was 1930? A. No; 1924. If I said 1930, I misstated myself. 1924.

This second contribution was the installation of radiant superheaters in the boilers. The boilers previously installed in the plant were equipped with convection superheaters which utilized heat from the gases in the furnace as they traveled through the furnace due to convection.

These radiant superheaters were different from those in that they were installed in such positions that they were exposed directly to the radiant heat from the combustion of the fuel. The advantage of the radiant superheaters over the convex type is that they not only give greater efficiency in

2853

boiler plant operation by utilizing more of the heat of combustion, but they also maintain constant temperature of steam over a wide range of loads. With convex superheaters, only, the tendency is for the temperatures to vary as the loads on the boiler vary, and the temperature of the gasses varies.

The installation of these radiant superheaters lowered the average heat consumption of the plant to 17,500 B. t. u.

—1,352—

per kilowatt hour during the first half of 1924, and after the

new boilers had been in operation for some time, the consumption dropped to 16,000 B. t. u. per kilowatt hour.

The downward trend which had been established prior to the installation of these radiant superheaters was continued after they went into operation, but this contribution to the economy of the plant shows up by an abrupt drop in the economy curve in the months following their installation and beginning of operation.

In 1926, the additional units, which I stated were in-
2855 stalled at that time, were accompanied by the installation of a third boiler room. The boilers installed at this time were designed to operate so as to deliver steam to the turbines at a pressure of 1,230 pounds.

This was the first installation of its size in the world to operate at that pressure. One turbo-generator rated at 7,700 kilowatts, 1,230 pounds pressure, and 290 pounds exhaust, was installed as a topping turbine to a 30,000 kilowatt unit which was also installed at the same time.

The high pressure generator, or rather the high pressure turbine, receives the steam at 1,230 pounds, expands it
2856 to 290 pounds when it is returned to the boiler for reheating. It is reheated to 700 degrees and is then delivered to the second generator which, at that time, was one of the 30,000 kilowatt units.

—1,353—

The successful operation of this high-pressure boiler and the topping turbine was a third major contribution to the field of power generation that was made by the Lakeside Plant.

As would be expected, difficulties were encountered in the operation of the 1,200-pound equipment and the efficiency

of the plant wasn't improved very greatly until these difficulties had been remedied.

By 1928, the equipment was operating smoothly and one more high-pressure boiler and two generating units were installed as before. The units operated in tandem as was the case with the first two high-pressure units.

The high efficiency of these units lowered the plant heat consumption to below 15,000 B. t. u. per kilowatt hour in 1929.

Two more high-pressure boilers and three more units, 2858
operating on the high-pressure-low-pressure cycle, were installed in 1930, bringing the total installed capacity of the plant to its present figure of 310,800 kilowatts.

As we know, at about that time, the business depression occurred and, as a result of that, the demand on the power plant fell off considerably. Because of the reduced loads on the plant, it was possible to produce most of its output by means of the high-pressure equipment.

This type of operation resulted in the maximum efficiency that could be achieved at the plant and in the winter of 1932

—1,354— 2859

and 1933, the heat consumption of the Lakeside Plant reached its all-time minimum average of about 13,000 B. t. u. per kilowatt hour of net output.

In addition to the contributions which Lakeside Plant has made to the field of power generation in the development of the use of pulverized coal, the use of radiant superheaters and large scale employment of high-pressure steam cycles, a series of experiments in low-temperature distillation of coal was also conducted there.

2860 These experiments were carried on for the purpose of ascertaining whether it would be possible to submit pulverized coal to temperatures at which the gas could be distilled off the coal without affecting the physical properties of the coal to such an extent that it could not subsequently be used in pulverized fuel boilers.

These experiments were carried on over a period of several months and the conclusions reached were that by means of the processes and equipment developed through those ex-
2861 periments, such low temperature distillation can be carried on successfully and can be carried on economically if a market for the by-products of the process could be had.

The Lakeside Plant was subsequently equipped to carry on that type of distillation of coal and the Port Washington Plant, which I will subsequently describe, has also been equipped to distill coal by that process.

—1,355—

We are not in the gas business, however, and we have not carried on those operations, but the management felt that inasmuch as that process could be conducted at the plants
2862 and it had possibilities of economy, that it would be wise to equip the plants in order to permit carrying it out.

The cost of equipment was very low and has not in any way interfered with the efficient operation of the plants as power generating stations.

Now, there is one noteworthy fact that should be brought out in a discussion of the Lakeside Power Plant and that is that in spite of the pioneering developments that were carried out in the construction of that plant, it was still constructed at a remarkably low unit cost.

The investment in the entire plant, including the step-up sub-station through which its output is delivered to the transmission and distribution facilities of Wisconsin Electric Power Company, is only $83.68 per kilowatt of installed capacity.

Q. Will you describe the Port Washington Generating Station? A. The Port Washington Generating Station is located in the city of Port Washington about twenty-five miles north of Milwaukee. It is on the shore of Lake Michigan. 2864

The plant contains one power generating unit, a turbo-generator rated at 80,000 kilowatts. This unit operates at a throttle pressure of 1,230 pounds per square inch and a

—1,356—

steam temperature of 825 degrees.

The boiler burns pulverized coal exclusively and the entire plant went into service in November in 1935.

The Lakeside Plant was originally planned to have an ultimate capacity of 200,000 kilowatts, but during its process of construction, loads on the system of the companies had grown so rapidly that the plant was carried beyond its originally contemplated capacity to its present capacity of 310,800 on completion. 2865

Even then it was evident that it wouldn't be long before the company would be faced with the problem of providing additional generating facilities and studies were made to determine the best location and type of such facilities. As I pointed out before, Lakeside is located south of the city of Milwaukee and was located there because loads had grown substantially in that direction during the years prior to its construction.

2866 *Edward H. Schmidtman—By Respondents—Direct*

At the time studies were being made to determine where the plant now located at Port Washington should be built, consideration was given to the fact that it would be desirable to have another plant located at some distance from the Lakeside Plant in such position so that the two would be fairly well balanced against the load center of the district they serve.

The site finally selected was in the city of Port Wash-

—1,357—

2867 ington and the reasons for the selection were:

First, the site north of Milwaukee, permitting the construction of a transmission loop, guaranteeing continuity of service to the area lying between the two major generating stations of the company.

It is located as near the load center of the system as was practical to do so inasmuch as it is twenty-three miles north of the Granville Sub-Station which is the major distribution center of the system, and Lakeside is twenty-four miles south of the Granville Sub-Station.

This location gives a very desirable balance of power

2868 facilities and load location.

The plant is located on Lake Michigan, which again is a very valuable source of cooling water. Port Washington has harbor facilities which permits the plant to receive lake-borne shipments of coal. It is in close proximity to existing transmission lines connecting Milwaukee and the properties of Wisconsin Michigan Power Company to the north.

Port Washington is a location to which large industries might be attracted by the presence of a source of economical power and, finally, the site chosen had convenient rail con-

2869

nections to the transportation facilities operated by the company.

Q. At that last point, isn't Lakeside similarly connected by rail facilities? A. Yes, Lakeside is. Lakeside is connected

—1,358—

to the railway system of the Transport Company by a rail line over which all the coal burned in the plant is hauled.

The Examiner: Does your company pulverize this coal or does it buy it in pulverized form?

2870

The Witness: No, it pulverizes its coal in the plants.

The coal—taking Port Washington as an example—is received on lake coal boats. It is unloaded on a coal dock which was built at the time the plant was constructed, and is stored there.

It is drawn from that storage and loaded onto rail cars which dump it into a screening plant, which screens out the heavy lumps and crushes them.

From the screening plant it is carried into the power plant where it is discharged into the pulver-

2871

izing mills. The design of the Lakeside Plant was made by engineers in the power plant department of Wisconsin Electric Power Company.

By Mr. Hamilton:

Q. You are speaking of Lakeside now or Port Washington? A. I am sorry. I mean Port Washington.

After the plans were completed, construction was begun in 1930. At that time, loads had recently been increasing and it was anticipated that the 80,000 kilowatts of capacity

—1,359—

to be installed in the plant would be needed within the length of time it would take to complete the construction of the plant.

The depression again disturbed those plans and load demands on the system fell off. As a result of that, construction was not carried on as rapidly as the original program contemplated, but was carried on at a rate sufficient to discharge the obligations of the company with respect to various commitments it had made on the purchase of equipment.

2873 Because of the delayed construction, the plant wasn't completed until 1935 and it went into operation in November of that year, adding 80,000 kilowatts to the active generating capacity of Wisconsin Electric Power Company.

The knowledge and experience gained by the company's engineers in the construction and operation of the Lakeside Plant were fully utilized in the design and construction of the Port Washington Plant.

The unit at Port Washington is what is called a tandem compound unit, in that it has a turbine with a high-pressure end and a low-pressure end. The boiler delivers steam to

2874 the high-pressure section of the turbine at 1,230 pounds pressure and a temperature of 825 degrees Fahrenheit.

The high-pressure section expands the steam through its stages and exhausts at pressures which vary, depending on the load on the unit, up to the neighborhood of 455 pounds

—1,360—

per square inch.

The steam is then carried back to the boiler and is passed through superheaters which reheat it to a temperature of 825 degrees and it is then returned to the low-pressure section of the turbine.

In passing through that section, it is fully expanded and exhausted into a condenser which is cooled by water pumped from Lake Michigan.

The plans for the station contemplate an ultimate capacity of 400,000 kilowatts and, as at present conceived, that ultimate capacity will comprise five units of 80,000 kilowatts each.

The present construction provides certain facilities in excess of those required for the operation of the present capacity. The coal dock, for instance, has a storage capacity 2876
of 330,000 tons of coal.

That storage will be adequate for considerably greater capacity than is now installed in the plant. The switch house and the coal handling facilities and the water tunnel which now supplies cooling water to the condenser, have all been installed to a greater capacity than is utilized by the present generating unit.

The present total investment in the plant, including the step-up sub-station, amounts to $105.72 per kilowatt of in-

—1,361—

stalled capacity, and if we apportion to future capacity those 2877
parts of the present facilities which have been installed for the use of additional capacity in the plant, there remains an investment of $79.59 per kilowatt of present installed capacity.

The Examiner: We will recess until 2:00 o'clock this afternoon.

(Whereupon, at 12:30 o'clock p. m., the hearing was recessed until 2:00 o'clock.)

—1,362—

AFTERNOON SESSION

(Whereupon, at 2:00 o'clock p. m., September 10, 1940, the hearing reconvened.)

The Examiner: You may proceed when you are ready.

Whereupon, EDWARD H. SCHMIDTMAN, the witness on the stand at the time of recess, resumed the stand, was
2879 examined and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Had you finished your description, Mr. Schmidtman, of the Port Washington Generating Station? A. Not entirely. I wanted to point out that the plant embodies a number of features which are worthy of note. One is that it is built entirely on the unit plan of construction—that is, the first section was laid out, being a single unit, naturally was built on the unit construction basis, but the plans for the ultimate plant will carry that same type of design throughout the
2880 entire station.

Each generating unit will be served by one boiler plant. It will have its own set of auxiliaries, its own transformers, and its own transmission circuits.

The plant will permit of flexibility in the design of future sections, being constructed on the unit basis. If any new developments in the art of using the steam cycles in generat-

ing electric power should take place, those developments can be incorporated in subsequent additions to the plant without disturbing the operation of those put in prior to that time.

 2881

The high temperature of the steam is somewhat above that employed in the Lakeside Plant and is in the range of the highest pressures used in steam plants today, both at the throttle and at the reheat temperature. That high temperature gives greater economy in the utilization of the heat.

The fourth point is that the energy is generated at 22,000 volts which results in reduced current carrying capacity of station wiring, switchboards and bus structures.

The Port Washington Power Plant has established an economy record which has not been equalled by any other plant in the world in regular central station operation. 2882

Problems have arisen in connection with the operation of the equipment and some interruptions have occurred resulting in shut-downs of the plant. Such instances would be expected in the operation of any new power plant or any old one for that matter.

In spite of these shut-downs, however, most of which were scheduled for inspection or repair work, the station has achieved the following average heat ecenomy record:

In 1936, the heat consumption averaged 10,954 B. t. u. per kilowatt hour of net output. 2883

—1,364—

In 1937, it averaged 10,835 B. t. u. per kilowatt hour of net output.

In 1938, it averaged 10,788 B. t. u. per kilowatt hour.

In 1939, the average was 10,770 B. t. u. per kilowatt hour.

And, in the first six months of 1940, the average heat consumption per kilowatt hour of net output was 10,730 B. t. u.

2884 *Edward H. Schmidtman—By Respondents—Direct*

The minimum monthly average heat consumption was 10,562 B. t. u. per kilowatt hour of net output and was realized in October of 1938.

Q. These plants which you have described are plants in regular operation, are they not? A. Yes, they are.

Q. And, as you have indicated in the case of the Racine Plant, the boilers are operated with regularity even though demand may not be placed upon them all the time? A. Yes, that is the case.

2885 Q. Are there any other stations in the system which are not operated with regularity? A. There are other plants in the system which are used entirely for steam heating purposes and are used for those purposes only occasionally. One of these is the plant located in the Public Service Building referred to as the Public Service Building Plant.

The Public Service Building is the main office building

—1,365—

of Wisconsin Electric Power Company and is located in the business district in the downtown area of the city.

2886 This plant was originally built in 1906 when the building was constructed and it had an electric generating capacity at that time of 4,500 kilowatts.

The electrical generating equipment was taken out of service in 1925, but the boilers have been continued in operation for the purpose of furnishing steam for the heating system.

The boiler plant is not operated regularly but is held as reserve steam generating capacity. Because of its location with respect to the steam distribution mains, the Public Service Building boiler plant renders valuable service to the

heating system in relieving some of the mains of heavy loads in that part of the area served so that it assists in maintaining continuity of service in that part of the system as well as relieving the other steam generating plants of a portion of their load during the peak heating system.

Q. Is there, in addition, a plant located in Stephenson Building? A. Yes. Wisconsin Electric Power Company also operates a boiler plant in the Stephenson Building. The company does not own the building but leases the space that is occupied by the boiler plant. 2888

This plant was acquired in 1926 when the company pur-

—1,366—

chased the utility property of Wells Power Company, a small company operating electric generating and distribution facilities in the city.

The generating capacity of the plant at that time was 1,000 kilowatts. The Wisconsin Electric Power Company has never made use of that generating equipment and shortly after acquisition removed it from service, keeping the boilers in use for steam generating purposes.

This boiler plant is operated regularly in the summer 2889 time only and supplements the steam transmission capacity of the high-pressure mains which serve buildings with heat for heating water and other heating requirements during the summer time other than space heating.

The low-pressure steam heating system is shut down completely in the summer and the high-pressure system is continued in operation purely for heating water and steam tables, and so forth, and the Stephenson Building Plant is used to supplement the transmission capacity of the mains

which furnish that service in the part of the city where this plant is located.

Q. Are the plants in the Stephenson Building and Public Service Building designated on Exhibit No. 32? A. No, they are not designated on Exhibit 32 as power plants inasmuch as they have no electric generating capacity.

Q. The Racine Plant, however, is designated? A. Yes,

—1,367—

the Racine Plant is designated on the map. It is shown by
2891 the open square with the vertical bar located at the city of Racine.

Q. What generating capacity does Wisconsin Gas & Electric Company have? A. Wisconsin Gas & Electric Company has four electric generating stations, having a combined installed generating capacity of 1,590 kilowatts. These facilities are very limited in capacity and are composed of 590 kilowatts of hydro-electric capacity and 1,000 kilowatts of steam generator capacity.

The hydro-electric capacity is made up of three stations. One is located at Watertown on the Rock River and has an
2892 installed capacity of 240 kilowatts.

The other two are located in and near the city of West Bend. They are on the Milwaukee River and have an installed capacity of 175 kilowatts each. These plants are all low-head plants—that is, the height through which the water falls in generating power in their water turbines is relatively low.

They are on small streams which have extremely variable flows and their output is small and not dependable. These

2893

hydro-electric plants are operated only when there is sufficient water in the streams to make their operation possible.

The steam power plant of Wisconsin Gas & Electric Com-

—1,368—

pany is located in the city of Waukesha. It was acquired by Wisconsin Gas & Electric Company in 1923 by the purchase of the electric and gas properties of the Waukesha Gas & Electric Company.

2894

The installed generator capacity is 1,000 kilowatts, but the generating equipment is not operated at all. The boilers are in continuous operation during the heating season and furnish steam for a heating system in Waukesha.

The electrical equipment is held as cold reserve on the system of Wisconsin Gas & Electric Company and is available as reserve capacity for the combined systems of the three companies.

These three generating stations of Wisconsin Gas & Electric Company produce a very minor part of the total power requirements of the company.

2895

As I have stated before, the output is not firm and is not relied upon. In 1939, it constituted only six-tenths of one per cent. of the total electrical energy requirements of Wisconsin Gas & Electric Company. The other 99.4 per cent. was purchased from Wisconsin Electric Power Company.

Q. The steam generating plant at Waukesha is designated on the map, is it not, Exhibit 32? A. Yes, it is shown on Exhibit 32, with a symbol designating a steam power plant.

Q. For the reason that it is available as reserve power

—1,369—

although not in operation, is that right? A. That is right.

Q. When you stated that the company did not rely for firm power or treat as firm power, power generated from its own facilities, you were speaking of both the hydro-electric plants and the steam plants, is that right? A. I was speaking specifically of the hydro-electric plants when I stated that the capacity was not firm and was not dependable. The steam plant, as I have stated, generates no power regularly and is held as reserve capacity.

2897 Q. What is the aggregate generating capacity of Wisconsin Michigan Power Company? A. Wisconsin Michigan Power Company owns and operates twelve generating stations having an aggregate installed capacity of 57,990 kilowatts.

Of these twelve generating stations, ten are hydro-electric plants with an installed capacity of 36,280 kilowatts in total. One of the twelve plants is a steam station located at Appleton, having an installed capacity of 20,000 kilowatts and one is a Diesel engine generating station located at Iron River, having a capacity of 1,710 kilowatts.

2898 Q. Turning, first, to the hydro-electric plants, is there a hydro-electric plant at Appleton, Wisconsin? A. Yes, there is.

Q. Will you describe it? A. Exhibit 32 shows a symbol

—1,370—

at Appleton designating a combined steam and hydro-electric power plant. The hydro-electric portion of this plant has an installed capacity of 1,440 kilowatts and the generating equipment consists of two vertical units rated at 520 kilowatts each, and one horizontal unit rated at 400 kilowatts.

2899

Q. You might explain, if you will, the difference between a vertical and a horizontal unit. A. The terms "vertical" and "horizontal" as applied to hydro-electric generating units, refers to the position of the shaft in the machine. A vertical unit has a vertical shaft, usually with the generator at the top and the water turbine at the bottom.

The generator is mounted on the generator floor and the turbine is included in a casing or wheel pit below the generator floor. The water comes into the plant through the gates in the side of the building immediately adjacent to the 2900
water turbines and flows through the turbines then downward and out of the plant in what is referred to as the "tail race."

The horizontal unit in the Appleton plant is one with a horizontal shaft with the water turbines mounted on one end outside the building and the generator on the other end inside the building.

The Appleton hydro-electric plant is located on the Fox River in the city of Appleton. It has an average operating

head of fifteen feet which is furnished by the upper of three 2901
navigation dams maintained in Appleton by the United States Government.

Q. And an operating head is what? A. The operating head is the distance in feet, the vertical distance in feet, between the elevation of the water above the dam from which the plant takes its water and the elevation of the open water surface immediately below the plant into which the water turbine discharges the water that passes through it.

As I explained yesterday, the water power existing at the navigation dams on the Fox River belongs to the Green

Bay & Mississippi Canal Company. The land on which the Appleton power plant stands is leased from the Green Bay & Mississippi Canal Company, and Wisconsin Michigan Power Company pays to the Canal Company a rental for the use of the land as well as annual tolls for the use of the power in the falling water at that point.

The water at the upper dam in Appleton is divided among several users according to the terms of the leases which the Green Bay & Mississippi Canal Company has executed with
2903 water users located at that point.

Under the terms of those leases, a certain portion of the flow in the Fox River above navigation requirements is available for use by Wisconsin Michigan Power Company, not all

—1,372—

of it but only a specified portion of it.

As I recall, there are four or five different concerns which make use of water from the so-called upper level which is the level of water created by the upper dam in Appleton. Because of the limited amount of water available to the company for its use in this plant, the Appleton hydro-electric
2904 plant, naturally, is operated so as to make the most complete use possible of that available water.

The flow in the Fox River, although regulated to some extent by the operation of the government storage dam at Neenah and Menasha, is still widely fluctuating as to quantity of discharge at different times of the year.

It also varies widely as to average discharge from year to year. There are instances on record where the flow in the river was so low that there was no water at all available above requirements for navigation.

Under those circumstances, the water power plants utilizing the surplus water in the river at the navigation dams had to shut down.

The Appleton hydro-electric plant has been shut down for days at a time because of inadequacy of water in the river. This plant was built in 1901 and was the successor to the world's first hydro-electric station.

The original plant began operating on September 30, 1882, which was only a few days after Thomas Edison's Pearl Street Station in New York went into operation. 2906

—1,373—

This pioneer hydro-electric plant generated electricity for lighting purposes only and its customers consisted of two paper mills and one residence. The generator in this plant was referred to as a dynamo and it received its power from the shaft of a beating machine in the paper mill.

The load on the beater was so variable, due to the manufacturing operations, that the dynamo would speed up and slow down as the speed of the machine varied. As a result, the voltage fluctuated widely and numerous lamp burn-outs resulted. Lamps were very expensive in those days. 2907

One of the present employees of Wisconsin Michigan Power Company recalls quite clearly that he would make the rounds every morning with a basket full of lamps and he would get $1.60 a piece for them.

Well, a situation under which lamps burned out so rapidly was intolerable, so very shortly the unit was taken off that beater shaft and was connected to be driven by a separate water wheel.

The original installation of the present Appleton power plant was made in 1901 by Wisconsin Traction, Light, Heat

2908 *Edward H. Schmidtman—By Respondents—Direct*

& Power Company, which I have explained was a predecessor of Wisconsin Michigan Power Company.

The plant contained four 500 k. v. a. generators, two of which generated direct current at 600 volts for the railway

—1,374—

system, and the other two of which generated alternating current for distribution.

These generators were mounted in pairs on two horizontal shafts, one direct current unit and one alternating

2909 current unit on each shaft.

The shafts projected through the outer walls of the power plant building into wheel flumes, which were built for the purpose of conveying the water from above the dam to the water turbines.

Each of these shafts carried three pairs of water turbines. In 1916 one of these entire units was removed and one generator from the other unit was removed. The space that had been occupied by the one unit which was removed completely was then utilized by the installation of two vertical hydro-electric units which are now in place—the two

2910 that are rated at 520 kilowatts each.

The reduced efficiency of the original wheels on the remaining horizontal unit made it impossible for that unit to carry full load on both the generators attached to the shaft so it has been re-rated at 400 kilowatts, giving the present rated capacity of 1,440 kilowatts in the Appleton hydro-electric plant.

Q. Is there a steam plant at Appleton as well? A. Yes, there is. The steam plant at Appleton is housed in the same building that houses the Appleton hydro-electric plant.

—1,375—

2911

The capacity of the steam station is 20,000 kilowatts, consisting of four turbo-generators rated at 5,000 kilowatts each. The boilers which furnish the steam for these units burn pulverized coal exclusively and deliver steam to the turbines at a pressure of 265 pounds per square inch and a temperature of 480 degrees.

The Appleton steam plant is operated very largely as a source of stand-by or auxiliary power for the ten hydro-electric stations operated by Wisconsin Michigan Power Company. Because of the importance of the loads in the 2912
Appleton area and the surrounding territory, it is considered advisable to keep at least one unit in the Appleton steam plant spinning at all times and carrying a light load.

The reason for that is that during certain times of the year when the output from the hydro-electric plants is high, most of the load in the Appleton area is carried by means of power delivered to the Appleton district over the high voltage transmission line from the northern portion of the territory.

In case of an outage on that line, it would be most important for the company to have spinning reserve at Appleton to immediately pick up that load without interruption 2913
to service.

The original installation at the Appleton steam plant was made in 1901 at the same time the hydro-electric plant

was built.

The two plants were built together. The initial generating equipment consisted of two 1,500 horsepower Corliss engines with clutches by means of which those engines could

be connected to the shafts on which the original horizontal hydro-electric units operated.

There were also clutches between the water turbines on those shafts and the generators. That arrangement made it possible to drive the generators by means of water power from the river or by means of steam power from the engine, or with both together.

In case there was not enough water to carry the load alone, that power would be supplemented by operating the
2915 steam engines.

By 1910, the loads on the plant had increased to the point where it was necessary to make an enlargement in its generating capacity and two low-pressure turbines driving generators rated at 1,250 kilowatts each, were installed in that year.

Two of the present 5,000 kilowatt units were added in 1917. Another was added in 1920, and another in 1924. In the year 1925, the boiler plant was converted to the use of pulverized coal, the success of that method of firing having been demonstrated at the Lakeside Plant in Milwaukee.

2916 In 1926, the first year of operation with pulverized coal,

—1,377—

the average heat consumption per kilowatt hour of net output was reduced by more than 25 per cent. of the average for 1924, the last year of operation before the adoption of pulverized fuel.

In order to relieve a crowded condition in the plant and to facilitate the rearrangement of certain electrical equipment, the two Corliss engines and the low-pressure turbines were removed in 1931. That reduced the installed capacity in the plant to the present figure of 20,000 kilowatts.

The Appleton steam plant was built by Wisconsin Traction, Light, Heat & Power Company. That company was merged into Peninsular Power Company which operated properties in upper Wisconsin and upper Michigan, and in 1927, the name of Peninsular Power Company was changed to Wisconsin Michigan Power Company.

Q. Is there a hydro-electric station in Twin Falls? A. Yes, there is.

Q. Will you describe it? A. The hydro-electric station located at Twin Falls is indicated on Exhibit 32 by the open 2918
square with the horizontal bar located north and slightly west of Iron Mountain, Michigan. It is at the junction of those five transmission lines which are shown on the map.

Q. Before we leave that, there is no name, is there, which

—1,378—

appears to identify it? A. No. The name of the plant is not shown on the map.

Q. Can you identify it with relation to any name which is shown on the map? A. Yes. It is on the Menominee River northeast of the City of Iron Mountain. 2919

Q. Don't you mean northwest? A. Yes. I mean northwest.

Q. Northeast of Florence? A. Northwest of Iron Mountain is a better description.

Q. And northeast of Florence? A. East and slightly south of Florence.

Q. Oh, yes. A. The power plant building is located on the Michigan shore of the river and the dam reaches from Wisconsin across the river to Michigan.

2920 *Edward H. Schmidtman—By Respondents—Direct*

The generation of the plant, however, is classified as generation in the state of Michigan.

The original section of this plant which was built in 1912 consisted of three units rated at 1,000 kilowatts each. In 1916, the plant was enlarged by the addition of two more units likewise rated at 1,000 kilowatts.

These are horizontal units, the wheels being contained in wheel casings inside the power plant building rather than in a wheel flume. The average operating head on the Twin

2921 —1,379—

Falls plant is forty-two feet.

The Menominee River, at this point, drains a watershed of 1,790 square miles which contributes the water available for the use of the plant. The area of the pond above the dam—that is, the water surface of the lake formed by the dam, itself—is 1,120 acres.

This pond is large enough to permit some degree of manipulation of stored water. By that I mean that it is possible for the plant to operate in such a way as to use more water than is flowing in the river at a given time or less water

2922 than is flowing in the river at another time by taking the additional water from the pond above the dam or permitting it to accumulate in the pond above the dam.

The extent to which Twin Falls plant can be operated in this manner is limited, however, by the fact that the plant is located on a stream which also serves a number of other water power plants below, and out of respect for their riparian rights, it is necessary for the Twin Falls plant to deliver substantially the natural flow of the stream to those water users downstream.

The volume of the pond above the dam is such that by drawing it down one foot, the plant is capable of generating 35,000 kilowatt hours of energy. The pond at Twin Falls is utilized to a considerable extent in ironing out the irregularities of flow resulting from peak load operations at the

—1,380—

Brule River plant located upstream which I will describe next.

The Twin Falls plant is also operated in such a way that its discharge will offset the irregular discharge from the 2924
Pine River plant located on the Pine River, whose operations I will also describe shortly.

Q. What is the present capacity of the Twin Falls plant? A. The present capacity is 5,000 kilowatts. That rating is at a rated power factor of 80 per cent.

The 80 per cent. power factor is the power factor specified by the manufacturer of the machines, but because of the characteristics of the transmission line through which a large part of the output from the Twin Falls plant is delivered, the plant usually operates at a power factor approximating unity, and because of that fact, it is possible for the plant 2925
to carry 6,200 kilowatts without overloading the units, and that load is frequently carried at the plant during seasons of plenty of water.

—1,381—

Q. Will you describe the Brule River plant? A. The Brule River hydro-electric plant is located on the Brule River northwest of the Twin Falls plant and northeast of the community of Florence. The plant is situated on an island in the Brule River but the island is considered a part of Michigan

so this plant is likewise located on the Michigan side of the river and its generation is classified as Michigan generation.

I should have explained in discussing the Twin Falls plant that it was built by Peninsular Power Company, predecessor to Wisconsin Michigan Power Company. At the time the Twin Falls plant was built Peninsular Power Company was operating an electric transmission and distribution system in the vicinity of Iron Mountain and Iron River. The principal sources of power at that time were the Twin
2927 Falls plant and a steam plant at the city of Iron River.

Loads increased during the years following 1912 and it was necessary to install additional generating facilities, and for that reason the Brule plant was built by Peninsular Power Company in 1916. The plant has a total installed generator capacity of 4,670 kilowatts, comprising three vertical turbine-driven generators.

The operating head on the plant is 60 feet when the pond is at normal elevation and the drainage area of the Brule River at this point is 1,040 square miles. The pond, when full, has a surface area of 774 acres and for each foot
2928 of elevation by which the pond is drawn down the plant is

—1,382—

able to generate 36,000 kilowatt hours of net output.

The pondage capacity of the Brule plant is used in carrying peak loads in the upper Michigan and northern Wisconsin portions of the territory of the Wisconsin Michigan Power Company. During the peak hours of the day the full capacity of the plant is operated, almost regardless of the season of the year.

This type of operation results during seasons of low flow in the discharge of larger quantities of water at certain times

of day and smaller quantities of water at other times of day. The irregular flow that is caused by this operation is discharged into the pond of the Twin Falls plant which is located immediately downstream.

There are no water users between and the operation as carried on does no damage with respect to conservation and so that type of operation is permissible, inasmuch as the Twin Falls plant is used as a regulating reservoir to smooth out the irregular flows.

The circumstances which make it possible for the Brule 2930
plant to be operated in this manner add appreciably to the value of the Brule River plant as a source of power in this portion of the company's system. If it were not for those characteristics there would be times of the year when the output of the plant would be limited to that which it could generate by using the reduced flow in the Brule River, whereas actually the plant can carry rated load at almost

—1,383—

any season of the year during the peak hours of the day.

Q. You have referred to the Pine River plant. Will you describe it? A. The Pine River plant is located on the Pine 2931
River which is shown on Exhibit 32 about five or ten miles west of the Menominee River. It is southwest from Iron Mountain and south from Florence. This plant was built in 1922 by Peninsular Power Company in order to increase its power supply. It operates at a head of 93 feet which is the highest head of any of the hydro-electric plants operated by Wisconsin Michigan Power Company.

Q. In order to clarify its location, did I understand you to say that it was southwest of Iron Mountain? A. I mis-

stated myself there. I was referring to Twin Falls. It is southwest of Twin Falls and south of Florence, nearly due west from Iron Mountain.

The drainage area of the Pine River at the point where the Pine River plant is located, is 520 square miles. The plant contains two vertical generating units, each rated at 1,600 kw, giving a total installed capacity of 3,200 kw. The pond above the dam at the Pine River plant is quite small, covering an area of only 170 acres when it is full.

2933 This plant was developed by building a relatively low dam across the Pine River at the head of Breakwater Rapids, then building a canal and flume along the side of the valley through which the river flows to a point on the hillside above

—1,384—

the location of the plant. At that point there is a large concrete forebay from which two steel penstocks extend down the side of the bank to the plant which is located on the shore of the Pine River at the foot of the rapids.

By means of the dam and the canal and flume the head, or rather the fall in the river, through the course of the 2934 rapids, is concentrated at the one point and amounts to a total of slightly over 93 feet. Allowing for friction losses in conveying the water the plant has an operating head of 93 feet.

Although the pond above the Pine River dam is rather small, the higher head on the plant makes it possible for the water to be used quite effectively in carrying peak loads. Perhaps I should explain. The amount of power that can be generated from falling water varies in direct proportion to the pressure or head which that water exerts on the blades

of the turbine it is turning, and also in direct proportion to the quantity of water which is flowing through the turbine.

Now then in this case we have a head more than twice as great as we have at Twin Falls so each cubic foot of water that is discharged by the Pine River plant will do more than twice as much work and will produce more than twice as much electrical energy at the Pine River plant as it would at the Twin Falls plant.

So in spite of the smaller reservoir or pond the higher —1,385— 2936
head makes it possible for the Pine River plant to be operated quite effectively as a carrier of daily peak loads. The pond is not large enough to store water over an operating cycle of more than one day, but it is quite effective for carrying hourly variations within the daily load curve.

The high head effective here gives the pond a peak load capacity of 11,000 k. w. h. for each foot of draw-down on the pond. The irregularities in flow in the Pine River which result from the peak load operations at the Pine River plant are carried on down and discharged into the Menominee River a short distance below the Twin Falls plant, as indi- 2937
cated by the map, Exhibit 32.

Immediately downstream from the mouth of the Pine River is a hydro-electric plant operated by the Ford Motor Company.

In order to deliver natural stream flow to the plant of the Ford Motor Company while the Pine River plant is being operated to carry peaks the Twin Falls plant is operated so that its discharge will offset the fluctuations in discharge from Pine River. That can be done effectively be-

cause in off-setting the flow it is necessary to supply only one cubic foot of water at Twin Falls for each cubic foot of water held back at Pine or to hold back one cubic foot of water at Twin Falls for each one delivered at Pine.

At the same time the cubic foot of water that is used at the Pine River plant produces twice as much power as the one withheld at Twin Falls would have produced, so the combined operation of the Twin Falls, the Brule and the

—1,386—

2939 Pine River plants work out as a very effective carrier of peak loads.

Q. Will you describe the Quinnesec Falls plant? A. The Quinnesec Falls plant of Wisconsin Michigan Power Company is located on the Menominee River south of the city of Iron Mountain. The symbol indicating this plant is shown on the map. This plant has an installed capacity of 3,530 kw, made up of two identical horizontal units.

The average head on the Quinnesec Falls plant is 61 feet and the drainage area of the Menominee River at that point is 2,600 square miles. The dam at this point is quite low,

2940 most of the head being furnished by the elevation of the falls, themselves.

The reservoir is small because of the low dam and does not contain enough water to permit any appreciable degree of peak load operation by the plant. For this reason the plant is run on what we refer to as a river-run basis using the flow in the stream as it comes up to the capacity of the plant to use such flow.

This plant was built by the Oliver Iron Mining Company in 1914. The mining company used the output of the plant

in operating its equipment in its iron mines near Iron Mountain and near Norway, Michigan.

The mining operations in Iron Mountain have subsequently been reduced and the mining company decided to sell the plant to Wisconsin Michigan Power Company. That

—1,387—

purchase was made in 1934. The Quinnesec Falls plant was originally built to operate at a head of 56 feet and did operate at that head during the period of its ownership by the mining company. 2942

At the same location and utilizing water from the same dam the Oliver Iron Mining Company operated a water-driven air compressor plant in which they compressed air for use in their mining operations. The water was supplied to the air compressor plant through an open flume, the upper edge of which was at such elevation that the head on both plants was 56 feet. When Wisconsin Michigan Power Company purchased the plant from the mining company it did not desire to continue operation of the air compressor plant so the gates to the flume were blocked off and the spillways on the dam, itself, were raised five feet, resulting in an increase in head of five feet on the hydro-electric plant. 2943

Because of that change the head is now 61 feet and the electric generating capacity and the electric output of that station are considerably higher than they were under the original arrangement.

I stated that the installed capacity of the plant had a rating of 3,530 kw. That rating is computed on the basis of a 80 per cent. power factor. The units were designed to operate at an 85 per cent. power factor, but the fact is that

they are normally operated under Wisconsin Michigan Power Company operations at almost unity power factor. This

gives them a capacity of about 4,400 kw and by overloading them within safe limits during the periods of the year when the flow in the river is sufficient to carry such loads, the company has been able to operate the plant fairly continuously, at loads approximating 4,600 kw.

This site is what would be referred to as under-developed.
2945 By that expression I mean that in terms of the head and the available water at the site under normal stream flow conditions a plant would ordinarily be expected to have a higher installed capacity than this one has. The low installed capacity in this plant results from the fact that when the Oliver Iron Mining Company built it they were then using a substantial portion of the flow in the river for operating that air compressor and there was no object in installing more hydro-electric equipment than could be operated along with the air compressing machinery. Because of that the hydro-electric plant is unable to use as much of the flow of the river
2946 as most plants on the system of the company are able to use, and if a development were made at this point today, assuming that present plant were not in place, the installed capacity would be considerably above that now in the plant.

Q. How much, would you say? A. It would be at least twice as great.

Q. Is the Menominee River the state line at the point on

the map at which Quinnesec Falls is shown? A. Yes, it is. The Menominee River constitutes the boundary between the

states of Wisconsin and Michigan, all the way from the mouth at Green Bay——

Q. Now, a symbol appears on the map on the south side, that is to say on the Wisconsin side, of the river; the plant is actually—— A. The plant is actually located on the Michigan shore of the river, yes. It was put on the south side there not to indicate the geographical location but rather to indicate a schematic relationship to the system.

Before continuing with the other plants perhaps it would be pertinent at this point to make some general observations 2948
about what is required for a hydro-electric development. There is a fairly popular misconception on this point which leads people to believe that a hydro-electric power plant can be built at almost any point that one would care to build one. That isn't the case. A number of very specific requirements must be met before it is economical to build a hydro-electric plant. First, a suitable location must be found and by a suitable location I mean one where the topography, that is the shape of the ground, is such that a dam can be built at not too great expense.

There should be a fairly steep pitch in the stream or there 2949
should be a fairly narrow canyon or gorge that won't take too large a dam to back up the water.

—1,390—

Second, the characteristics of the stream should be such that there will be a sufficient quantity of water available with sufficient regularity to permit a plant installed at that point to deliver some degree of dependable output.

The drainage area above the point in question is important, in that it will have a large influence on the percentage

of total precipitation which will run off and be discharged by the stream. Its magnitude or size will determine the volume of flow available.

The characteristics of the stream with respect to variations in flow should be reasonably satisfactory in that the plant won't have to be shut off entirely for periods in the year because there is no water in the river and neither should it go so high during flood season that the tailwater rises to a point where the head is reduced and the capacity of the
2951 plant is curtailed.

In the general area in which the hydro-electric plants of Wisconsin Michigan Power Company are located, the streams have reasonably steady flows. The Menominee River and its tributaries are not considered extremely flashy. The sites located in this general district, however, will all fall into the low head class, that is we have nothing that will approximate the heads available in some of the larger and better known plants in the country. For that reason one who develops water power sites in this district must be sure that the flow of water is sufficiently dependable, the cost of the
2952 —1,391—
installation is sufficiently low, that the output from the plant will be reasonably steady before he can afford to make investment in a development of that kind. We find it necessary to furnish steam stand-by capacity equal to about one-half of the installed capacity of a hydro-electric plant in order to make the output of that plant firm. In the case of some streams the steam stand-by must be higher than that because the stream falls so low that output of the plant falls to less than one-half of the installed capacity.

Q. Are there recognizable periods of high and low flow in the rivers on which you have plants in the Wisconsin Michigan territory? A. Yes, there are.

Q. They occur with regularity, year after year? A. Yes, within small variation we know fairly well when the spring flood is going to come and when the summer drought will occur. We also have a very regular secondary flood in the fall preceding the winter freeze-up.

Q. Will you identify the periods of high and low flow by months? A. The high water season in our streams usually 2954
begins between March 15 and April 1, and tapers off to what we would consider medium flow conditions by the middle of June. In the later part of July and carrying all through August and into September we experience our summer drought. In October and the early part of November we

—1,392—

normally have a rainy season on the watershed of these streams which carries the flow well above drought conditions and approaches mild flood conditions. The flow then falls off and stays relatively low during the winter but not as low as it is during the summer drought. We experience our 2955
lowest run-off conditions in the summertime.

Now, from year to year these variations may shift a week or two in either direction, but within those limits they can be depended upon to occur at those times except in years of unusually severe drought when the fall rains may not develop at all and the summer drought may be of longer duration than is the case normally.

Q. And in your load forecasting you actually do depend, do you not, on the occurrence of those periods of high and low water? A. Yes, we do.

Q. Within those limits? A. Yes, we do. We budget our production according to a schedule which recognizes those variations in flow and the manner in which they affect the hydro-electric out-put.

Q. Will you describe the Sturgeon River hydro-electric plant? A. The Sturgeon River power plant of the Wisconsin Michigan Power Company is located on the Sturgeon River near the community of Loretto, a few miles east of the city of Norway, in Michigan.

2957 —1,393—

The Sturgeon River is a tributary of the Menominee River. This plant has a single unit rated at 800 kw capacity. It operates at an average head of 65 feet and the river at that point drains an area of about 300 square miles. The plant was built in 1922 by Peninsular Power Company as an additional source of energy for distribution on its system.

The pond above the dam, when full, has a surface area of 248 acres and the plant, by drawing on this stored water, can generate 12,000 kw hours for each foot of draw-down within the draw-down range.

2958 Each of these plants has a limit to which the pond water can be drawn down economically because when the elevation of the pond water is lowered the head or pressure on the wheels is reduced and a given quantity of water used under those conditions of reduced head will produce fewer k. w. h. than it would produce if the pond level were at its maximum.

The flow in the Sturgeon River is not sufficient to permit the plant to carry full load at all times but by utilizing the water stored in the pond it is possible to make the full installed capacity of the plant available for peak load operation during the peak load hours of the day.

2959

There are no other users of water power on the Sturgeon River below this plant and except for conservation requirements, that is with respect to not injuring fish life, the plant is capable of exercising some latitude in manipulating the flow of the stream.

—1,394—

All of these peaking operations of the hydro-electric plants of the Wisconsin Michigan Power Company must be carried on within the limitations imposed by consideration of conservation matters. The Conservation Commission of 2960
Wisconsin has authority over regulation of stream flow to the extent that it may affect aquatic life and so no operator of a power plant is permitted to shut off the flow of a stream completely because if that were done there would be considerable damage to the fish.

The statute also requires that fish ladders or fish ways must be provided wherever a dam is built across a stream in the state and if such fish ways or fish ladders are not provided the owner or operator of the dam has the option of entering into an agreement with the Conservation Commission under which the operator will either stock the waters 2961
with fish above the dam or will pay to have such stocking done.

Mr. Binford: Was that the Wisconsin Commission?

The Witness: The Wisconsin Conservation Commission.

The Examiner: Are you through with that answer?

The Witness: Yes, with that point I am through.

The Examiner: We will have a little recess then.

(Whereupon, a short recess was taken.)

—1,395—

2962 *Edward H. Schmidtman—By Respondents—Direct*

By Mr. Hamilton:

Q. Will you describe the Chalk Hill Plant, Mr. Schmidtman? A. The Chalk Hill hydro-electric plant is situated on the Michigan side of the Menominee River, ten miles east of Amberg, Wisconsin. Amberg is not shown by name on Exhibit 32 but is located at the junction of the 132,000 volt line in Marinette County, Wisconsin.

The total installed generating capacity of the Chalk Hill Plant is 7,800 kilowatts.

2963 Q. I think you had better locate that plant a little more specifically. Can you locate it in relation to Niagara? A. Did you say with relation to Niagara? It is downstream from Niagara on the Menominee River just outside the area indicated as the electric service territory of Wisconsin Michigan Power Company.

It is the upper one of those two hydro-electric plants in that vicinity. The Chalk Hill plant has three vertical generating units rated at 2,600 kilowatts each. It operates at an average head of twenty-eight feet and receives its water from the drainage area of 3,300 square miles.

2964 The surface area of the pond above the dam is 765 acres and the pond contains sufficient water to permit the generation of 15,000 kilowatt hours for each foot of pond drawdown.

The Chalk Hill Plant is ordinarily operated as a river-

run plant, utilizing the flow of the stream as it comes, but when peak carrying capacity beyond that supplied by the other plants is needed in the northern portion of the territory, this plant is also operated as a peak carrier.

The irregular discharge of water resulting from these peaking operations is absorbed in the pond of the White Rapids Plant which is located immediately downstream.

The Chalk Hill Plant was constructed in 1927 and was acquired in 1937 by Wisconsin Michigan Power Company. The former owner was Northern Paper Mills, a concern which operated a paper mill in Green Bay.

Q. And it was acquired in what year? A. It was acquired in 1937 by Wisconsin Michigan Power Company.

Q. Will you describe the White Rapids hydro-electric 2966
plant? A. The White Rapids hydro-electric plant is located on the Michigan shore of the Menominee River immediately downstream from the Chalk Hill Plant. The generating equipment in this plant comprises three vertical units, two rated at 3,000 kilowatts each and one rated at 2,000 kilowatts, making a total rated generator capacity of 8,000 kilowatts.

The drainage area of the river at this point is 3,400 square miles and the head—the operating head on the plant is twenty-nine feet.

—1,397— 2967

The pond above the White Rapids dam is somewhat smaller than that above the Chalk Hill dam, covering an area of 445 acres when the pond is at maximum operating elevation. Sufficient water is stored in the pond to generate 10,000 kilowatt hours per foot of pond draw-down.

This plant is operated so as to discharge normal flow to the stream below. The pond is utilized to absorb the irregularities in the discharge of the Chalk Hill Plant when that plant is used in helping to carry peak loads on the company's system.

2968 *Edward H. Schmidtman—By Respondents—Direct*

The White Rapids plant was built in 1927 at the same time that the Chalk Hill Plant was built. The two stations were connected by means of a 132,000 volt transmission line with the paper mill of the Northern Paper Mills at Green Bay.

They were also connected by means of another 132,000 volt transmission circuit to the 132,000 volt transmission line of Wisconsin Michigan Power Company lying between Twin Falls and Appleton.

2969 The Northern Paper Mills used such power as it needed in its operations of the paper mill of Green Bay and sold the surplus output from the two plants to Wisconsin Michigan Power Company.

The contract for the sale of this energy provided that the entire output of the Chalk Hill Plant should be delivered

—1,398—

to the company and the surplus output of the White Rapids Plant, over and above the paper mills requirements in its operations—excuse me. Would you read that please?

2970 (Whereupon the statement above was read by the reporter.)

A. (Continuing) ——should also be delivered to the company.

This arrangement was continued until 1937 when Wisconsin Michigan Power Company purchased both plants from Northern Paper Mills.

Q. Both Chalk Hill and White Rapids? A. Yes.

Q. Now, is there a hydro-electric plant at Oconto Falls? A. Yes, there is.

Q. Will you describe it? A. The Oconto Falls hydro-electric plant is located on the Oconto River at the community of Oconto Falls. It is shown on the map, Exhibit 32, at a point outside the territory designated as the electric service territory of Wisconsin Michigan Power Company, in Oconto County.

Q. Wisconsin? A. Wisconsin Michigan Power Company.

Q. Oconto County, Wisconsin? A. Yes. This plant has a combined installed capacity of 1,440 kilowatts consisting of four horizontal units of various sizes. 2972

—1,399—

The drainage area of the Oconto River at this point is 754 square miles and the head on the hydro-electric plant averages twenty-eight feet under operating conditions.

The pond above the dam is limited in size, having a surface area of only 240 acres at maximum elevation.

The plant is capable of generating five thousand kilowatt hours from stored water for each foot the pond is drawn down. The Oconto Falls Plant is used in carrying daily peaks during the low water season to as great an extent as the capacity of the pond will permit. 2973

This peaking capacity is of great value to Wisconsin Michigan Power Company because the plant is located at the end of the transmission system in the southern portion of the company's territory and is very effective in maintaining voltage regulation on the system in that district.

The plant also relieves peak loads on the transmission circuits serving the territory at that point.

The Oconto Falls Plant was built in 1915, the first section consisting of one unit with a capacity of 600 kilowatts. It

was rebuilt in 1924 and since that time has been used to generate electrical energy for a pulp mill at Oconto Falls and for distribution to the public.

This plant was purchased by Wisconsin Michigan Power Company from the Union Falls Manufacturing Company, the

—1,400—

former owners.

Q. Have you named all the hydro-electric plants of Wisconsin Michigan Power Company? A. No, there is one more
2975 known as the Weyauwega—W-e-y-a-u-w-e-g-a—located at the community of Weyauwega in the southwestern portion of the territory near Appleton. It is designated by the symbol indicating a hydro-electric plant and is shown in the southern portion of Waupaca County, Wisconsin.

This plant contains a single generating unit rated at 400 kilowatts.

The unit is of the vertical type and operates at an average head of evelen feet. The reservoir area—or rather the pond area—above the dam, covers 286 acres and contains enough water to generate 2,400 kilowatt hours for each foot
2976 of draw-down.

During seasons when the flow in the stream is sufficient to drive the plant at full load, the plant operates so as to utilize as much water as possible.

During seasons when the flow is below plant capacity, the unit is operated so as to carry daily peaks to the extent that the limited reservoir capacity will permit.

The Weyauwega Plant was acquired by Wisconsin Michigan Power Company in 1925 when the property of the Weyauwega Electric Company was purchased. The plant

which was included with the property acquired at that time

—1,401—

was an old and obsolete and inefficient installation.

The plant was completely rebuilt by Wisconsin Michigan Power Company in 1930 when the present equipment was installed.

Q. You spoke of one Diesel engine plant as being owned by Wisconsin Michigan Power Company. Will you locate that plant? A. The only Diesel engine plant owned by Wisconsin Michigan Power Company is located in the city of 2978
Iron River, Michigan.

This plant is shown by the appropriate symbol on Exhibit 32 at the city of Iron River, west of Crystal Falls. It contains two generating units, each rated at 855 kilowatts, giving a total rated capacity of 1,710 kilowatts.

The generators are driven by 1,250 horsepower, five-cylinder Diesel engines.

The plant was built by Peninsula Power Company in 1923 as a means of increasing its supply of stand-by power to make firm the generation of the water power plants operated by that company at that time. 2979

The plant is not now in regular operation, but is started and run under load for short periods periodically in order to make sure that the equipment is in operating condition and could be used in case the occasion required.

Q. Has the company a storage reservoir under construc-

—1,402—

tion in the Michigamme River? A. Yes, Wisconsin Michigan Power Company is now engaged in the construction of a storage dam on the Michigamme River in Iron County,

2980 *Edward H. Schmidtman—By Respondents—Direct*

Michigan—M-i-c-h-i-g-a-m-m-e. The location of this dam is not shown on Exhibit 32, but can be located on the map as the point at which the Michigamme River makes a sharp turn north and east of Crystal Falls. The dam will be located on the east and west section of the river at that point.

Q. The river runs almost directly east in Dickinson County, does it not? A. At the point where the reservoir dam will be constructed, the river extends for a very short distance into the open area of the map northeast of Crystal Falls and
2981 the dam will be constructed on a section of the stream where it is actually flowing toward the west.

This dam will result in a substantial improvement in the regularity of the flow in the Menominee River and will consequently improve the characteristics of the power generated by all plants on the Menominee.

The reservoir is of such capacity that it will store five billion cubic feet of water and will increase the firm capacity of the four hydro-electric plants of Wisconsin Michigan Power Company on the Menominee River by about 3,700 kilowatts and will increase their annual output by about seven
2982 —1,403—
and a half million kilowatt hours.

Q. Can you approximate the time at which this proposed dam will be completed? A. The present construction schedule which is being followed successfully contemplates that the dam will be finished in time to capture the spring floods in the year 1941. That means that it will have to be finished no later than the first of March, 1941.

The present progress of the construction indicates that that completion date will easily be met.

2983

Q. In addition to the existing hydro-electric plants, what additional water power sites does Wisconsin Michigan Power Company own? A. Wisconsin Michigan Power Company owns part or all of the land required for the development of six water power sites. One of these is located on a stream which is not shown on Exhibit 32. It is the Sturgeon River which flows north into Lake Superior from Baraga County which is shown on the map.

The river rises in the vicinity of Michigamme which appears on the map above the letter "G" in the word Michigan, 2984
and flows generally to the west, turns around to the northeast and discharges into the body of water which cuts off the Keweenaw Peninsula from the main body of the upper peninsula.

—1,404—

The undeveloped power site is located in Baraga County at about the west limit of the open space to the west of the word Baraga. This site has an available head of eighty-seven feet and if developed to utilize the quantities of flow usually utilized in rivers of this character, will support a
generating capacity of 1,350 kilowatts and in a normal 2985
stream flow year would produce an output of 2,500 kilowatt hours.

Q. And that location has a name, does it? A. Yes, that site is known as the Big Falls site on the upper Sturgeon River. The word "upper" is applied to this Sturgeon River to distinguish it from the Sturgeon River in Dickinson County on which the Sturgeon River Plant of Wisconsin Michigan Power Company is now located.

2986

Another of these undeveloped water power sites is located on the Paint River which flows into the pond of the Brule River Plant.

The Paint River is a relatively small stream and has not been shown on the map, Exhibit 32. This site known as Horse Race Rapids has a potential head of sixty feet and will support an installation of 2,400 kilowatts which in a year of normal run-off would be capable of generating 13,200,000 kilowatt hours.

2987

Q. Would you relate that site to a town in the relatively immediate neighborhood? A. The best way of describing the location of that site would be to say that it is

—1,405—

located north of and in the immediate vicinity of the Brule River Plant which is northeast of Florence.

Another of the undeveloped sites in which Wisconsin Michigan Power Company is interested is known as the La-Salle Rapids site on the Pine River.

This site is located upstream from the Pine River Plant just below the junction of the two rivers that join at that

2988

point.

The available head here is forty-nine feet and the site would support a capacity of 2,000 kilowatts which would produce 7,000,000 kilowatt hours in a year of normal stream flow.

Q. And the junction of the two rivers to which you referred appears on the map, Exhibit 32? A. Yes, the junction does appear on the map.

Another undeveloped water power site owned by Wisconsin Michigan Power Company exists in the form of addi-

 2989

tional head which could be developed at the company's present Quinnesec Falls Plant.

I explained that this plant was purchased from Oliver Iron Mining Company. When that purchase was made, there was also acquired from the Mining Company sufficient land above the pond of the present plant to permit the development of additional head of twenty-nine feet, either by means of raising the present dam at Quinnesec Falls to that

—1,406—

extent or by installing another dam upstream at a point 2990
where that head could be developed.

The more economical plan of utilizing this increased head would be to raise the dam at Quinnesec Falls. If that were done, an additional head of twenty-nine feet would be utilized, permitting the economical installation of an additional capacity of 10,000 kilowatts which would generate increased output of 64,000,000 kilowatt hours in a year of normal run-off.

All of the additional capacity covered by this redevelopment and the additional output available from it would not be due to the increased head of twenty-nine feet. 2991

A portion of it would be due to increasing the use of water at the site beyond the point to which the present capacity is able to use the water.

I explained that the present plant is under-developed. The proposed redevelopment which I have just outlined would not be an under-development of the site.

Q. Is the figure of 10,000 kilowatts which you have given additional to the existing capacity of Quinnesec Falls? A. Yes, that would be additional capacity.

2992 *Edward H. Schmidtman—By Respondents—Direct*

Q. So that the redevelopment would not disturb the existing capacity of Quinnesec Falls? A. No, not at all, and the 64,000,000 kilowatt hours would be in addition to the

—1,407—

output of the present plant. Another undeveloped water power site in which Wisconsin Michigan Power Company holds a portion of the land required for development is known as Sand Portage Rapids on the Menominee River.

This site is located at a point on the Menominee River
2993 which falls between the communities of Niagara and Norway on Exhibit 32.

The head available at Sand Portage Rapids is forty-two feet. The proposed development would have a capacity of 9,100 kilowatts and would generate an average annual output of 38,000,000 kilowatt hours.

Another undeveloped hydro-electric site owned by Wisconsin Michigan Power Company is known as the Pemene—P-e-m-e-n-e—dam site on the Menominee River.

This site is located at a point upstream from the Chalk Hill Plant where on Exhibit 32 the Menominee River first
2994 has electric service territory of Wisconsin Michigan Power Company on both sides.

The available head at the Pemene dam site is twenty-seven feet and a development of that head would support a capacity of 6,000 kilowatts and produce an annual average output of 30,000,000 kilowatt hours.

There are three other undeveloped water power sites in the territory of Wisconsin Michigan Power Company whose value would be materially improved by the construction of

—1,408—

the Michigamme storage reservoir.

2995

Extensive investigation of these sites has not been made, but it is known that after the Michigamme reservoir is completed, these three sites which are located on the Michigamme River between the site of the reservoir dam and the mouth of the stream, where it flows into the Menominee River below the Brule River Plant, would support a total installed capacity of about 15,000 kilowatts.

I would like to add here also that all of the undeveloped power sites which I have named and have described as being located on the Menominee River will also be improved considerably in value by the completion of the Michigamme storage reservoir, because of the improvement in flow that that reservoir will produce on the Menominee River.

2996

Q. Does that mean then that the figures you have given for the three named sites on the Menominee River would be increased as a result of the operation of the Michigamme reservoir now in construction? A. It is possible, depending on load conditions existing on the system at the time of the development of these sites, that the improved flow resulting from the operation of the Michigamme reservoir would lead to a decision to install more capacity at some of these points than I have indicated normal stream flow would economically support.

2997

—1,409—

It can't be stated with certainty whether that would happen, but it is entirely possible because of the improved flow that would be present in the stream.

This much is true, however, that whether the capacity of these proposed plants is changed or not, the operation of the Michigamme storage reservoir will undoubtedly increase the

2998 *Edward H. Schmidtman—By Respondents—Direct*

number of kilowatt hours available annually from the operation of such plants and to that extent would enhance their value.

All of these undeveloped sites are reasonably attractive. That is, they are not just places on the river where it looks as if power could be generated.

They will all reasonably well support the investment that would be required in making the installations, provided there is a market for the power.

2999 Under present conditions, Wisconsin Michigan Power Company is meeting its power requirements adequately with its present generation facilities and by means of an interconnection with the system of Wisconsin Electric Power Company.

Q. Have these sites been chosen as a result of extensive studies? A. Yes, they have. Each of these sites that I have named has been surveyed, preliminary cost estimates involving preliminary designs have been carried out, estimates of the available output and the value of such output have been

—1,410—

3000 made in order to determine whether the sites are worthy of consideration.

In each case, it has been found that with a market for the power the sites are worth more than the cost of the land which the company has purchased at the various locations.

I emphasize a need for a market for the power because that consideration is making it more and more difficult for water powers anywhere in the country to be developed economically.

I testified this morning on the progress that has been made in economy of generation by steam. Those advances

in economy and improvements in efficiency have been accompanied by reductions in cost.

Everyone of these water power sites will be critically examined as to whether it will be capable of competing with the low-cost steam power which can be produced in the steam plants of Wisconsin Electric Power Company before money will be spent on improving them.

Should the loads in the northern portion of Wisconsin Michigan Power Company's territory develop, however, as we hope it will, it is quite likely that many of these sites 3002 will be found economical and will be actually developed.

Q. You spoke of some of the factors which enter into the selection of a water power site. Did you make rainfall

—1,411—

studies in connection with such a selection? A. Yes. We have made extensive studies prior to the acquisition of any of these undeveloped sites.

In the cases of some, the investigations have been more extensive than in the cases of the others. The Big Falls site on the Sturgeon River, which is the first one I mentioned, was one on which the most extensive studies of all 3003 were made.

At the time Wisconsin Michigan Power Company became interested in the acquisition of that property, there wasn't a great deal of reliable information available on the discharge characteristics of the Sturgeon River.

Some studies had been made a number of years before, but there were gaps in their record and those gaps occurred during the flood seasons of the year, which, for the purposes of this investigation, were the most critical periods of the year.

3004 *Edward H. Schmidtman—By Respondents—Direct*

This development, as studied at that time, contemplated a very large storage reservoir which could be filled only by means of capturing the extreme floods in the spring. The reason that those gaps existed in the data made available to us was that the stream gauging stations that had been installed by the engineers who made the previous investigation had been put at such places that they were incapable of measuring the stages in the river during those periods.

A second reason was that the curves which those engineers

3005 —1,412—

had prepared, by means of which the elevation of the water in a river is related to the discharge of the river, had been determined at points which the floods, themselves, disturbed and changed the relationship of the water stage—meaning the elevation of the water—to the stream discharge.

Now, because of those gaps in the data, we were not satisfied to use the assumed figures which had been supplied because, upon investigation, we found that those estimated figures which had been offered in substitute for actual records indicated flows substantially in excess of what the flows

3006 would have been estimated at had we used actual records on surrounding streams for those same periods.

The Sturgeon River drains into Lake Superior and drains an area lying generally in the northern part of Iron County, most of Baraga County and reaching over into Ontonagon and Gogebic Counties.

Other streams draining portions of that same general area showed characteristics which led us to believe that the estimated figures for the Sturgeon River were considerably exaggerated.

3007

Now, this property was being offered to the company for sale and although we had no reason to question the integrity of the people who had made the studies, our job was to find out whether the representations that they were making with respect to this site could be relied upon.

—1,413—

As a result of the discrepancy between the estimated figures supplied us and the performance of streams in surrounding watersheds, we decided that the best thing to do would be to install our own stream-flow gauges and our own precipitation gauges on the watershed drained by the Sturgeon River.

3008

Those gauging points and rainfall stations were installed and were kept in operation for a number of years. The records I believe have not been taken during the past two years, but were continued even beyond the time when we were convinced that the price of the property was less than its value as a potential power site.

The company did purchase that property and now holds the Big Falls site as a potential source of water power which would be very useful, as may be seen from the map, in holding up the voltage on the portion of the system reaching into that district and in relieving the transmission line of the loads it must carry in serving that district.

3009

Power capacity on the outlying branches of a system has more value than simply that assignable to so many kilowatts or so many kilowatt hours.

It has what an economist would call "place utility" by being located on a part of the system at which it can do more

3010 *Edward H. Schmidtman—By Respondents—Direct*

than just supply kilowatt hours to a customer and can also improve general operations of the transmission system.

—1,414—

We have made similar investigations on other undeveloped sites although they weren't quite as searching as those we made on the Sturgeon River.

Q. Generally speaking, is production expense low on the hydro-electric plants? A. Yes, it is. Production expense per kilowatt hour of output is very low in hydro-electric
3011 plants, very much below production expense in steam plants. The principal element of cost connected with hydro-electric generation is that of fixed charges on the investment.

Here again, however, two of the elements of fixed charges are sometimes lower than in the case of steam plants. One of those is depreciation.

The rotating equipment in a hydro-electric plant almost invariably operates at a lower speed than does the equipment in a steam plant. It has a longer life and the investment in dams and reservoirs and waterways has a very long life, and over all, the depreciation on investment in hydro-electric
3012 developments is substantially less than that on investment in steam power plants.

The other element of fixed charges which is sometimes lower in the case of water power developments is that of taxes, especially in districts where utility properties are taxed locally.

These plants are in outlying areas. They are in the

—1,415—

woods, one might say, and certain times of the year some of these plants can be reached only by skis or snowshoes and the tax rates in the townships in which these plants are

located would be expected to run below the taxes of locally taxed property in the metropolitan areas. 3013

It happens that in the case of utilities operating in the State of Wisconsin, the operating properties are taxed by the State, so the location has little influence on the tax rates, but in some instances it is entirely possible for the tax rate on hydro-electric properties to be appreciably below that on steam properties which are usually located at the urban centers where their load is situated.

Q. How about labor costs? A. The labor cost per kilowatt hour in hydro-electric plants is also below that in steam plants. 3014

Depending upon the type of load the plants carry, a hydro-electric station might produce more kilowatt hours per kilowatt of capacity than a steam plant or less than a steam plant. One couldn't generalize on that, but the amount of labor required per kilowatt of generating capacity is much less in a hydro-electric plant and generally the labor cost per kilowatt hour is less.

The reason for that can be seen if we consider one element—that of maintenance. Maintenance costs on hydro-electric properties are very low in comparison with maintenance costs on steam operating properties, as I pointed 3015

—1,416—

out with respect to depreciation.

Those same differences would apply to maintenance costs, particularly with respect to rotating equipment.

Q. But it is necessary in this territory to back up the hydro-electric production with steam power? A. Oh, yes. It is most necessary because of the character of the streams on which our hydro-electric plants are located.

3016 *Edward H. Schmidtman—By Respondents—Direct*

I have pointed out that the streams utilized for hydro-electric generation by Wisconsin Michigan Power Company are relatively steady. Perhaps, I should be a little more specific on that point. They are steady with respect to many other streams in our part of the country, but the degree to which they are steady might best be illustrated by the statement that the flow in he Menominee River sometimes falls to a point where the Twin Falls Plant can carry a load equal to only about one-fifth of its installed generating capacity.

3017 At other times of the year, during the floods, the discharge of the Menominee River at the Twin Falls Plant is as much as eight to ten times the capacity of the plant. During those seasons all of the water in excess of the capacity of the wheels to utilize it naturally has to be spilled through the spillways.

—1,417—

There are no plants on the system of Wisconsin Michigan Power Company which do not find it necessary at certain times of the year to spill considerable quantities of water.

3018 Mr. Hamilton: We are about to turn, Mr. Examiner, to another general subject matter of the presentation.

Perhaps this is a time to break off for the evening.

The Examiner: All right, we will recess until tomorrow morning at 10:00 o'clock.

(Whereupon, at 4:25 o'clock p. m., the hearing was recessed until 10:00 o'clock a. m., September 11, 1940.)

—1,418—

3019

BEFORE THE

Securities and Exchange Commission

File No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

3020

Hearing Room 1102,
Securities and Exchange Commission Building,
Washington, D. C.,
Wednesday, September 11, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

3021

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

3022 *Edward H. Schmidtman—By Respondents—Direct*

PROCEEDINGS

The Examiner: Let us resume, gentlemen.

EDWARD H. SCHMIDTMAN resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Schmidtman, how many points of interconnection are there between Wisconsin Electric Power Company and
3023 Wisconsin Gas & Electric Company in the transmission system of the two companies? A. There are seventeen points of interconnection between the electric systems of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company which are shown on Exhibit 32.

These points of interconnection appear at Racine, at a point north of Racine on the territorial boundary line between the area served by Wisconsin Electric Power Company and the territory served by Wisconsin Gas & Electric Company; at Kenosha, at Burlington, at two points between Burlington and Racine at Waukesha, at Whitewater in the
3024 northwest corner of Walworth County, at Watertown, at the village of Merton, which is in the northern part of Waukesha County where the color of the line changes from yellow to red; at Granville Sub-station, at the point where the line of Wisconsin Gas & Electric Company enters the territory of Wisconsin Electric Power Company, west of Whitefish Bay,

—1,420—

at Port Washington, at a railway sub-station a few miles northeast of Port Washington, at Belgium, at Cedar Grove, and at Elkhart Lake which is in the northern portion of the territory served by Wisconsin Gas & Electric Company.

In addition to these seventeen points of interconnection which are shown on the map, there are twenty-two other points at which the systems of the two companies interconnect, which points are not shown on this map because the lines haven't been shown.

For the most part, those lines are distribution lines operating at voltages below those of the lines shown on the map.

Q. Can you indicate generally those twenty-two points of interconnection? A. It will be difficult to explain the 3026
locations of some of them because they are on low voltage distribution lines and are at points which are not connected with any of the points indicated on the map.

An example of that would be two points of interconnection near the city of Racine in the distribution systems of the two companies.

There is one connection in the township of Granville which is the township in which the Granville Sub-Station is located. There is another in the township of Waukesha where

the city of Waukesha is located, another near the village of 3027
Pewaukee, which appears north of Waukesha.

There is one in the township of Sullivan in Jefferson County, another in the township of Eagle in Jefferson County. There is another north of Milwaukee in the vicinity of River Hills which appears on the map, another at the sub-station at Brown Deer, another in the township of Merton, in which the village of Merton is located, one in the township of Brookfield, where the village of Brookfield is situated. That village may be found on the map nearly due west from the village of Shorewood which is on the shore

3028 of the lake, a distance of about two inches on the map; in the township of Troy in which the village of Troy Center in the northern portion of Walworth County is located there is another such interconnection.

There is another in the township of Oconomowoc near the city of Oconomowoc in the northwest portion of Waukesha County.

Now, I haven't named them all, but those will serve as examples.

3029 Q. Altogether there are twenty-two? A. Yes, altogether there are twenty-two which are on lines not shown on the map.

These twenty-two points of interconnection are used to deliver energy from the system of one company to the system of the other and the amounts of energy so transferred at these points is less than the amounts transferred at the

points shown on the map because of the fact that the lines are at lower voltages and are portions of the distribution system rather than being parts of the main transmission

3030 systems of the companies.

Q. Now, is there an interconnection between the electric service properties of the Wisconsin Electric Power Company and those of Wisconsin Michigan Power Company? A. Yes, there is. There is a high capacity interconnection between the transmission systems of Wisconsin Electric Power Company and Wisconsin Michigan Power Company at the Appleton sub-station.

That interconnection is shown by the interconnection symbol which appears to the right of the sub-station symbol at the city of Appleton.

3031

The transmission line colored red, extending from the Milwaukee area to this interconnection point is owned by Wisconsin Electric Power Company.

At that point, the interconnection is through the city limits sub-station of Wisconsin Michigan Power Company with the transmission facilities of that company.

Q And the city limit sub-station is located on the city limits of Appleton, Wisconsin? A. Yes, that is right.

Q. Now, there appears on Exhibit No. 32, I believe, a

—1,423— 3032

parallel line. a parallel transmission line, for at least a part of the distance between Appleton and the eastern portion of the Wisconsin Michigan property at that point.

Is it correct to say that the lines of the two systems are operated in parallel at that stretch of territory? A. Speaking electrically, those two lines do not operate in parallel; they operate in series.

Q. But they parallel each other physically? A. They parallel each other physically, and the two circuits are carried on opposite sides of one string of double-circuit steel towers. 3033

Q. That is what I am trying to get at. A. Yes.

Q. And from that point, the line goes generally north as the property of Wisconsin Michigan Power Company up to the northern territory, is that true? A. Yes, that is true.

Q. And would you mind identifying that line so there will be no possible confusion between county lines? A. The line of the Wisconsin Michigan Power Company extending from the city limit sub-station goes to the east and dips slightly to the south to a point where it departs from the

3034 line of Wisconsin Electric Power Company, coming in from Milwaukee.

That junction is located near the community of Forest

—1,424—

Junction, the name of which is not indicated on Exhibit 32.

From that point, the line of Wisconsin Michigan Power Company extends in a northeasterly direction to the vicinity of Green Bay, then skirts the southwestern tip of Green Bay and extends generally north past the community of Niagara,
3035 and then into Michigan and northwest to the high voltage sub-station at the Twin Falls hydro-electric plant.

At that point the 132,000 volt line of Wisconsin Michigan Power Company terminates.

Q. And the voltage of the line that you have just located is 132,000 from Appleton for its entire course, is that right? A. Yes, it is. I will describe that line in more complete detail later.

Q. What is the circuit mileage of the transmission system operated by Wisconsin Electric Power Company? A. Wisconsin Electric Power Company operates 675 miles of
3036 transmission circuits which are carried on 534 miles of supports. The reason that there are more miles of circuit than there are of supports is that some of the supports carry more than one circuit.

Of the 675 miles of circuits, 301 miles operate at 132,000 volts, and 374 miles operate at 26,400 volts.

The mileage of lines operating at 26,400 volts at the present time includes forty-two miles of line originally built

—1,425—

to operate at 66,000 volts, but which is being temporarily operated at 26,400 volts at the present time.

Within the next year or so that line will again be operated at 66,000 volts. Wisconsin Electric Power Company is making some extensions of its transmission capacity and this temporary operation of the line at 26,400 volts and its future conversion back to 66,000 volts are a part of the general program.

I would like to point out that the interconnections, which Wisconsin Electric Power Company has with the systems of Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company, have the effect of uniting the combined 3038
facilities of all three companies into one effective operating power system.

The flow of energy as between the systems of the three companies is carried out to the mutual advantage of all three, the idea being kept in mind that the most advantageous method of operating the three with respect to over-all results, is the proper one to follow.

Returning now to the mileage of transmission lines operated by Wisconsin Electric Power Company, 253 miles of the 534 miles of supports are steel towers, three miles are made up of underground conduit, and 278 miles are made up 3039
of pole line.

This length of pole line includes seven and a half miles

of wood pole "H" frames, which are used to support a 132,000 volt circuit. All the other mileage of pole lines consists of single poles.

Q. Now, there appears on Respondents' Exhibit No. 32, a transmission line between Milwaukee and Watertown. Will you describe that line? A. The line to which you refer begins at the West Allis Sub-station in the city of West Allis.

3040 *Edward H. Schmidtman—By Respondents—Direct*

That sub-station is indicated on Exhibit 32 by the sub-station symbol immediately below the community indicated as West Allis at the west limits of Milwaukee.

The line extends west to Waukesha, then northwest to Waukesha Beach, continuing west through the community of Delafield, then west and north past the city of Oconomowoc, then north and west through the community of Ixonia and west and northwest to the city of Watertown.

This line is the line of forty-two mile length which I spoke
3041 of a moment ago as being operated temporarily at 26,400 volts although originally constructed for 66,000 volt operation.

It consists of two circuits of 1/0 copper which are carried on double circuit steel towers. Each of these circuits consists of three conductors arranged in what is referred to as vertical arrangement; that is, the three wires are supported on one side of the towers with the suspension arranged so that

the wires are above each other in a vertical plane. There is one such circuit of three wires on each side of the towers.

3042 This line was originally built to operate at 66,000 volts and the first section of it which went into operation at that voltage extended from Waukesha Beach to Watertown. At Watertown it formed an interconnection with the system of Wisconsin Power & Light Company, a non-affiliated electric utility.

By means of that interconnection, there was purchased from Wisconsin Power & Light Company twenty-five-cycle hydro-electric energy generated in the Power and Light Company's hydro-electric plants on the Wisconsin River.

 3043

This section went into operation in 1909. The section from Waukesha Beach to West Allis at that time operated at 38,000 volts, but in 1914 it was reconstructed to operate at 66,000 volts.

For a number of years 25-cycle energy was received over this line from Wisconsin Power & Light Company, but Wisconsin Electric Power Company desired to eliminate the use of 25-cycle energy on its system and embarked on a program to reduce that use as rapidly as was reasonably possible to do so. 3044

As a result of that program, the market for 25-cycle energy on the system of Wisconsin Electric Power Company diminished and at the same time Wisconsin Power & Light Company embarked on a program of rewinding the gen-

erators in those plants so that they would generate 60-cycle energy instead of 25-cycle.

That company also wished to reduce the use of 25-cycle energy on its system.

Now, as a result of the reduction of the generation of 25-cycle energy, one circuit of this transmission line from West Allis to Watertown was converted to 60-cycle operation at 26,400 volts in 1938 and in July of 1940, the delivery of 25-cycle energy to Wisconsin Electric Power Company ceased entirely and the other one of the two circuits was converted to 26,400 volt 60-cycle operation. 3045

Q. Delivery by Wisconsin Power & Light Company? A. Yes. There is now under construction a 66,000 volt sub-station at a point to the west and slightly north of the present West Allis Sub-station. This new sub-station is

3046 *Edward H. Schmidtman—By Respondents—Direct*

located on the 132,000 volt circuit which extends from the Lakeside Power Plant and carries on around to the north and connects with the line which extends to Appleton.

This sub-station will have an initial capacity of 15,000 k. v. a. and will have transformers that will transform between the voltages of 132,000 and 66,000. When the sub-station has been completed, it will relieve the West Allis Sub-station of its 66,000 volt operations and will then be the point of delivery to the line which extends to Watertown.

3047 —1,429—

At that time, the line to Watertown will again be converted to 66,000 volt operation.

The circuits of this line, since the termination of the delivery of 25-cycle energy by Wisconsin Power & Light Company, have served to carry energy from the metropolitan area to Watertown——

Q. (Interposing) The metropolitan area in Milwaukee? A. The Milwaukee metropolitan area, yes. (Continuing) ——to Watertown, and to the various distribution stations located along the route.

3048 It also serves to complete a transmission loop constituted by the circuits of Wisconsin Gas & Electric Company to Watertown and the circuits of this line from Watertown back to West Allis.

Q. So that energy is delivered into the system of the Wisconsin Gas & Electric Company at Watertown? A. Yes, it is by means of this line which I have just described.

Q. Now, will you describe the transmission line running from Milwaukee to Appleton? A. This line operates at 132,000 volts. We regard its one terminus as being at Lake-

side Power Plant and the other at the City Limits Sub-station of Wisconsin Michigan Power Company at Appleton. The frequency is 60 cycles and the length of the line 119 miles.

—1,430—

This line was built in three sections. The first section extended from the old Granville sub-station located near the site of the present Granville Sub-station, to Random Lake which appears on Exhibit 32 at a point directly west from Cedar Grove, which is near the shore of Lake Michigan. 3050

The purpose of that section of line which was built in 1923, was to deliver energy from the system of Wisconsin Electric Power Company to the system of Wisconsin Gas & Electric Company through a sub-station which was then in operation at Random Lake.

In the same year, later in the year, the line was extended as far north as Plymouth, which appears on Exhibit 32 as a community not served from the system of the companies. At that point there was formed an interconnection with the system of Wisconsin Power & Light Company which serves the territory not cross-hatched on the map in this general vicinity. 3051

I should add here, however, that service from the city of Plymouth and the immediately surrounding territory is rendered by a municipal plant.

By means of the interconnection with the system of Wisconsin Power & Light Company at Plymouth, that company was able to obtain from Wisconsin Electric Power Company substantial quantities of electrical energy which were

used in the Sheboygan district of the system of Wisconsin Power & Light Company.

In 1931, that interconnection was discontinued inasmuch as Wisconsin Power & Light Company completed in that year a 30,000 kilowatt steam generating station near the south limits of the city of Sheboygan.

That plant was able to take over the load which up to that time had been served by means of the interconnection with the system of Wisconsin Electric Power Company.

3053 The other two sections of the Lakeside-Appleton line were built in 1925. The section from Plymouth to Appleton consists of a single circuit 4/0 line of aluminum cable, steel reenforced.

That is the conductor which has a steel core with aluminum strands wound around it.

I neglected to state that the section of line from the old Granville Sub-station to Plymouth consisted of number 3/0, aluminum cable, steel reenforced.

The section of line from the old Granville Sub-station to the Lakeside Power Plant which was also built in 1925

3054 consisted of number 3/0 aluminum cable, steel reenforced, only one circuit being installed at that time on one side of double-circuit steel towers.

The section from Granville to Plymouth and the section

from Plymouth to Appleton also consisted of a single circuit of conductors on double-circuit steel towers.

The construction of the latter two sections completed the connection between the Lakeside Power Plant of Wisconsin Electric Power Company and the Appleton sub-station of the Wisconsin Michigan Power Company.

This interconnection, as will be explained, subsequently, plays a very important part in the coordinated operation of the electric facilities of the two companies and further to the extent that Wisconsin Gas & Electric Company's operations are intimately interwoven with the electric operations of the Wisconsin Electric Power Company, this transmission line affects the operation of all three companies.

Q. Now, is that line in its entirety operated at 132,000 volts? A. Yes, it is. The entire length from the Lakeside Power Plant sub-station to the City Limit Sub-station at 3056
Appleton operates at 132,000 volts.

Q. And in its entirety is of steel tower construction? A. Yes, it is steel tower construction all the way.

Q. Available for double-circuits? A. There have subsequently been installed on a portion of the towers occupied by this circuit, other circuits which occupy the other side of the towers.

I will describe those in taking up those circuits indi-

vidually.

We regard the line from the Lakeside Plant to the Apple- 3057
ton Sub-station as one individual circuit which is treated as a single unit in our transmission system.

That is why I have limited my description to that one circuit.

Q. Now, there appears on Respondents' Exhibit No. 32 a line running from the Lakeside Power Plant to Whitewater. Will you describe that line? A. This line also operates at 132,000 volts throughout its entire length. It has a total length of fifty miles and operates at 60 cycles. It

consists of one circuit of number 3/0 aluminum cable, steel reenforced, carried on double-circuit steel towers.

The other side of the towers carrying this circuit is vacant for the entire distance, the entire length of the line.

This line was built in 1925 in order to accommodate increased requirements for electric power on the system of Wisconsin Gas & Electric Company in the southwestern portion of the territory it serves.

Prior to the construction of the Lakeside-Whitewater
3059 line, these loads of Wisconsin Gas & Electric Company were carried by means of the 26,400 volts owned and operated by Wisconsin Gas & Electric Company which were supplied with energy at Kenosha, Burlington, and Watertown.

—1,434—

These points of supply are points at which the system of Wisconsin Gas & Electric Company connects with that of Wisconsin Electric Power Company.

The capacity of the 26,400 volt lines serving the Whitewater area prior to 1925 was insufficient to adequately meet the requirements of the growing load and this 132,000 volt
3060 line was built to accommodate those loads.

In 1939, the line was extended approximately seven and a half miles to the southwest as shown on Exhibit 32.

At the point where this extension crosses the boundary line of the territory in which Wisconsin Gas & Electric Company renders electric service, it interconnects with a similar line of Wisconsin Power & Light Company extending northeast from the Janesville Sub-station of that company.

This extension consists of one circuit of aluminum cable, steel reenforced, with a cross-section of 266,800 circular mils.

The conductors are carried on wood pole "H" frames, this seven and a half mile length of "H" frame line being the section I referred to when I described the supports of the company's lines in general.

The contract covering the interconnection and interchange of power with Wisconsin Power & Light Company states that the facilities to be constructed by each of the companies shall be of sufficient capacity to furnish a source

to either company of 25,000 kilowatts of emergency power. 3062

This line will carry a load of substantially more than 25,000 kilowatts.

If proper voltage regulation is available at the sending end and unity power factor could be maintained at the receiving end, the capacity of the entire length of line including the extension would be about 40,000 kilowatts.

The carrying capacity of that line could be increased from Lakeside to Whitewater by adding a second circuit on the vacant side of the double-circuit steel towers, but from Whitewater to the point of interconnection with Wisconsin Power & Light Company the capacity could be increased only by either installing larger conductors, or by constructing another section of line because there is no available conductor space on the present supports. 3063

Q. Now, the terminus of that line in Whitewater is what? A. The 132,000 volt sub-station of Wisconsin Gas & Electric Company located at Whitewater.

Q. And power is delivered into the system of Wisconsin Gas & Electric Company at that point? A. Yes, it is. The point of delivery at Whitewater is the 132,000 volt bus of the

sub-station. That bus, of course, belongs to Wisconsin Gas & Electric Company and the only outlet for that energy

—1,436—

from that point is through the distribution system of Wisconsin Gas & Electric Company.

Now, energy interchanged with Wisconsin Power & Light Company at the territorial boundary line does not flow through the Whitewater sub-station of the Wisconsin Gas & Electric Company.

3065 It simply passes by and doesn't enter into the sub-station at all, but the energy delivered to the sub-station is taken off through the transmission and distribution lines of Wisconsin Gas & Electric Company.

Q. Have you indicated the voltage of the line running from Whitewater to the point of interconnection with Wisconsin Power & Light? A. Perhaps not specifically. That is a 132,000 volt line.

Q. Now, there appears on Respondents' Exhibit No. 32 a line connecting the Lakeside Power Plant with the city of Kenosha on the south. Will you describe that line? A. Yes.

3066 The line you refer to appears on Exhibit 32 as the one lying farthest to the left of the lines extending from the Lakeside Plant to the south. It does not pass through any of the communities shown along the lake shore. At a point west of Racine, a loop circuit takes off this line and extends into Racine and back to the main north-south route of the line.

—1,437—

In Racine, it connects with the 19th Street 132,000 volt sub-station of Wisconsin Electric Power Company. Continuing south from a point west of Racine, it extends into

Kenosha where it connects with the 132,000 volt Albers Street Sub-station of the Wisconsin Gas & Electric Company.

Q. And here again, electric energy is delivered from the system of Wisconsin Electric Power Company into the system of Wisconsin Gas Company? A. Yes, energy is delivered by means of this line into the system of Wisconsin Gas & Electric Company at the Racine Sub-station of Wisconsin Electric Power Company, as well as at Kenosha Sub-station of Wisconsin Gas & Electric Company. 3068

This line operates at 132,000 volts and consists of a single circuit of number 4/0 copper conductor carried on double-circuit steel towers all the way from the Lakeside Plant to the Kenosha Sub-station.

Q. That is a distance of how many miles? A. A distance of sixty-one miles, including the loop into the Racine Sub-station.

Q. Sixty-one circuit miles? A. Yes.

Now, I stated that the line consisted of single-circuit conductors on double-circuit towers. That is true of the entire length of this line except that section extending into 3069

the Racine Sub-station.

On that section, the circuit goes in on one side of the towers and comes out on the other, so those towers are actually carrying two circuits of conductors.

The purpose of constructing this line was to increase the supply of power for the Racine and Kenosha districts. Prior to the construction, the loads in those areas were served by means of 26,400 volt lines lying generally along

the lake shore and by means of power generated in the Racine Power Plant.

The line was built in 1925. In 1927, this line was extended from Kenosha, a distance of about two miles west, and then straight south to the Illinois line where it interconnected with the system of the Public Service Company of northern Illinois.

By reference to Exhibit 32, it will be observed that there is a short section of line of Wisconsin Electric Power Com-
3071 pany extending west from the city of Kenosha. This short section represents the portion of the section which was extended to the Illinois line which now all remains completely in place.

The purpose of the Illinois interconnection was to furnish a source of emergency power for both Wisconsin Electric Power Company and the Public Service Company of northern Illinois.

—1,439—

The interconnection facilities established by both com-
3072 panies had a transmission capacity of 45,000 kilowatts which was specified in the contract as the capacity which each company should make available to the other for emergency service.

This extension consisted of number 4/0 copper conductor on double-circuit steel towers, only a single circuit of conductors being installed.

In 1935, the interconnection with Public Service Company of northern Illinois was discontinued. The Illinois company removed sections of its line and subsequently Wis-

consin Electric Power Company took down portions of its line and used the materials elsewhere on its transmission system.

Q. Now, that line running from the spur is not shown on the map? A. No. The spur extending wes from Kenosha represents that portion of the line which still remains completely in place.

Q. And that is how long? A. That is 1.64 miles long. The entire extension from Kenosha to the Illinois line, including the spur shown on the map, was about nine miles 3074 long.

Subsequent to the discontinuance of the interconnection at the Illinois line, Wisconsin Electric Power Company, as I have stated, used portions of the materials of this line at

--1,440--

other places on the system and during the course of the years has removed two 132,000 volt oil circuit breakers.

I should explain here that these circuit breakers, although they were installed for the purpose of serving this transmission connection, were installed in the Albers Street sub-station of the Wisconsin Gas & Electric Company and 3075 belonged to that company.

They have been removed, however, and installed at other points on the systems of Wisconsin Electric Power Company and Wisconsin Michigan Power Company.

There have also been removed from the Illinois extension 3.2 miles of the copper conductors, all three wires being taken down for that distance. Four-tenths of a mile of conductors and insulators have been removed and 4.1 miles of all the insulators on the line, with the exception of one on each conductor, have been removed.

The single insulator was left up in the case of this distance in order to make it possible to leave the wire in place, since no need for the wire had at that time been found.

Q. Are the steel towers still in place, however? A. Yes, all of the steel towers are still in place.

We estimate that it would cost approximately $55,000.00 to restore this line to its original operating condition.

Q. Now, on Respondents' Exhibit No. 32 there are other lines shown, originating at the Lakeside Power Plant. Is

3077 —1,441—

there a so-called Lakeside-Granville line? A. Yes, there is.

Q. Will you describe it? A. I explained that the circuit from the Lakeside Plant to the Appleton Sub-station is regarded as one circuit or one line, and that that circuit is carried on one side of double-circuit steel towers extending from the Lakeside Plant to Appleton.

Between the Lakeside Plant and the Granville Sub-station there is another circuit carried on the opposite side of these same towers.

Q. I don't believe you have located the Granville sub-

3078 station. Will you locate it on the map? A. The Granville sub-station is located near the community of Granville which appears in the northeast corner of Milwaukee County.

It is approximately due west from the village of Fox Point which is located on the shore of Lake Michigan at about the same latitude.

The Lakeside-Granville line consists of twenty-five miles of circuit, the circuit being three number 4/0 aluminum cables, steel reenforced. They occupy one side of the towers which were built in 1925.

Edward H. Schmidtman—By Respondents—Direct 3079

In 1931, a 132,000 volt sub-station was built at 28th Street in Milwaukee. This sub-station apears on Exhibit 32 immediately to the left of the steam power plant symbol

—1,442—

designating the East Wells Street Power Plant.

It was installed for the purpose of furnishing an additional source of large quantities of power for the industrial area in the city of Milwaukee.

A line serving this sub-station was built consisting of a double-circuit, three hundred thousand circular mil copper 3080
line on steel towers. This line extended from the 28th Street sub-station to the Lakeside-Granville line. At the same time this circuit was constructed, conductors of the same size were substituted for the number 3/0 and number 4/0 aluminum cables which prior to that time were in place between the Lakeside plant and the point where the 28th Street sub-station tap connects with the circuit, so that from Lakeside to the 28th Street sub-station, there are now two circuits of 300,000 circular mil copper conductors, each circuit carried on one side of one row of double-circuit steel towers.

These circuits operate at 132,000 volts and have a trans- 3081
mission capacity of 90,000 k. v. a.

The 28th Street sub-station also has a capacity of 90,000 k. v. a.

Q. What is the function of the Lakeside-Granville line?
A. The function of the Lakeside-Granville Line is to carry

—1,443—

power from the Lakeside Plant to the Granville Sub-station.

The Granville Sub-station serves a very heavy industrial load in the northwestern portion of the city of Milwaukee and in the suburbs in that portion of Milwaukee County.

3082 *Edward H. Schmidtman—By Respondents—Direct*

The Granville sub-station is classified in our property accounts as a transmission sub-station, but in addition to its transmission functions, it also serves as a major point of distribution of power to heavy customers.

Q. On Respondents' Exhibit No. 32, various lines are shown as originating at the Port Washington generating station. Will you describe the lines of the Wisconsin Electric Power & Light originating at that station? A. The line extending to the west from Port Washington and connecting
3083 with the 132,000 volt Lakeside-Appleton line, was built at the same time the Port Washington Power Plant was built.

Its purpose is to provide an outlet for a major portion of the power generated by the Port Washington Plant. This line consists of two circuits, one extending from the Port Washington Power Plant Sub-station to Saukville, at which is located the junction of the Port Washington line and the Milwaukee-Appleton line.

Another circuit extending from Port Washington passes through Saukville and then turns south and follows the route of the Lakeside-Appleton line to the Granville Sub-station,
3084 —1,444—
a distance of twenty-three miles.

The circuit from the power plant sub-station to Saukville consists of 300,000 circular mil copper on double-circuit steel towers and the circuit from the Port Washington Sub-station to the Granville Sub-station also consists of 300,000 circular mil copper conductors, that portion south of Saukville occupying the previously vacant side of the steel towers in the Lakeside-Appleton line.

3085

At the time these circuits were installed, new conductors were put on the opposite side of the towers from Saukville to Granville.

These new conductors were of the same kind as those extending to the Port Washington Plant and replaced the 4/0 copper erected in 1923—I am sorry; I made an error there. It replaced the old 3/0 aluminum cable, steel reenforced, which was erected in 1923 by number 4/0 copper conductors, stranded copper.

3086

These circuits and the changes in conductor sizes which were made between Saukville and Granville have provided an outlet with a capacity of 90,000 k. v. a. for the Port Washington, Plant, although not all of the output of that plant comes out over the 132,000 volt lines.

Some of it is taken off through the 26,000 volt sub-station and the 26,000 volt lines which are fed by it.

Q. Does Wisconsin Electric Power Company have other

transmission lines which are not shown on Respondents' Exhibit No. 32? A. Wisconsin Electric Power Company has transmission lines other than those I have described which

3087

are shown on Exhibit 32.

Q. All right. Begin with those, if you will, and describe them. A. All the transmission lines of Wisconsin Electric Power Company which I have not already described operate at 26,400 volts.

Q. That is to say, all lines shown on the map that you have not described, is that true? A. Yes. These lines serve to connect the high-voltage sub-stations which feed the distribution system. In constructing these lines, a point has

been made of producing parallel or loop circuits wherever economically possible in order to provide alternate routes of power in case of outages on any particular sections and by that means reducing the probability of service interruptions.

The principal lines among those operating at 26,400 volts which are shown on Exhibit 32, include a line extending from the Lakeside Power Plant to the Racine Power Plant. This line is shown on Exhibit 32, following a route beginning
3089 at the Lakeside Power Plant, then passing through Cudahy, South Milwaukee, and Carrollville to Racine.

—1,446—

This line has a total length of twenty-four miles, of which twenty-two miles are carried on wood pole supports and two miles are carried in underground conduit.

Extending from this line at a point just south of the Racine County line, a small tap or spur extends to the west to a point of interconnection with Wisconsin Gas & Electric Company.

3090 The twenty-four mile length which I have just given includes the length of that tap. This line carries energy from the Lakeside Power Plant to the Racine district and was one of the principal sources of power for the Racine district prior to the construction of the Lakeside-Kenosha 132,000 volt line.

Another 26,400 volt line of importance in the system of Wisconsin Electric Power Company is one extending from the West Allis Sub-station whose location I have previously described, to Waukesha. This line has a total length of twelve miles and consists of number 1/0 copper, carried on

3091

wood poles. Its function is to deliver energy from the West Allis Sub-station which is fed by lines from the Lakeside Plant to the Waukesha sub-station for distribution in that area over the system of Wisconsin Gas & Electric Company.

Another line which parallels the one I have just described extends from the Lakeside Plant around and through the West Allis Sub-station, then west to Waukesha.

—1,447—

This line serves, in general, the same functions as the line from the West Allis Sub-station to Waukesha, except 3092
that it extends on through to the Lakeside Plant where it derives its source of power.

It also serves to furnish energy to the West Allis sub-station for distribution in the area served by that sub-station. This circuit consists of number 1/0 and number 4/0 copper and is about twenty-five miles in length. There is also another circuit operating at 26,400 volts extending from the Lakeside Power Plant to the West Allis Sub-station.

This one is eleven miles in length, of which ten miles are carried on wood poles and one mile is in underground conduit. The portion carried overhead consists of number 4/0 3093
stranded copper and the portion lying underground consists of 300,000 circular mil copper conductors.

A 26,400 volt line extends from the Waukesha Sub-station to the Watertown Sub-station, a distance of thirty-five miles.

This circuit consists of number two copper conductors carried on wood poles for the entire distance. It operates generally in parallel with the circuits I described previously as being operated temporarily at 26,400 volts and prior to the time that those circuits were operated at that voltage

3094 this circuit served to deliver energy to the 26,400 volt sub-stations located along the route between Waukesha and

—1,448—

Watertown.

Another circuit operating at 26,400 volts extends from West Allis to Watertown. I would like to correct that. It extends from West Allis to Burlington and East Troy.

That line may be found on the map by starting at the point marked West Allis and traveling generally south to

3095 St. Martins and then following two branches, one nearly west, but slightly south, through Muskego, Big Bend and Mukwonago to East Troy, where the East Troy Sub-station is located, and the other branch leading southwest from St. Martins through Wind Lake, Waterford and Rochester, to the Burlington Sub-station.

The total length of this line is forty-seven miles of number two copper carried on wood poles, and six miles of number 3/0 aluminum cable, steel reenforced, carried on wood poles.

The line receives energy from the West Allis Sub-station

3096 and delivers that energy to the various points along its route and to the sub-stations at East Troy and Burlington. At East Troy the energy received from this line is stepped down to lower voltages and delivered to other lines which distribute it in the East Troy district and surrounding rural areas.

At Burlington, the energy which is delivered by this line is partly converted to lower voltages for distribution by Wisconsin Gas & Electric Company in the Burlington area,

—1,449—

and is partly received at line voltage and taken out on the 26,000 volt lines of Wisconsin Gas & Electric Company.

A 26,400 volt line connects the sub-stations at Burlington and East Troy. This line passes through the community of Honey Creek. It is thirteen miles long and consists of number two solid copper conductors supported on wood poles. It furnishes a source of power for the Honey Creek district and forms a loop circuit bounded by East Troy, Burlington and St. Martins, making it possible to carry service to practically any point on the loop regardless of 3098 where an interruption might occur.

Another 26,400 volt line is operated by Wisconsin Electric Power Company between Cedar Grove and Weedens in the northern portion of the territory served by Wisconsin Gas & Electric Company.

This line has as its purpose the delivery of energy to railway sub-stations located at Oostburg and Weedens. These railway sub-stations have recently been taken out of service because of the abandonment of interurban railway operations of the Milwaukee Electric Railway and Transport Company on the line north of Port Washington. 3099

Q. The line you last referred to is in Sheboygan County? A. Yes, it is.

Another 26,400 volt line is operated by Wisconsin Elec-

—1,450—

tric Power Company between the cities of Racine and Kenosha. This one is indicated by the line colored red. lying immediately to the left of the gas transmission main indicated between those cities.

Its length is ten miles and it consists of 1/0 and 4/0 copper conductors carried on wood poles. This is one of the

lines I previously referred to as formerly furnishing power to Kenosha before the construction of the 132,000 volt line from Lakeside to Kenosha.

It still carries substantial quantities of energy and furnishes valuable reserve transmission facilities to guarantee continuity of service in the Kenosha area.

A 26,400 volt line extends from the Granville Sub-station to Port Washington. It is twenty-four miles long and consists of number three, number two and number 4/0 copper
3101 conductors.

The conductors are carried on wood poles over the entire length of the line. The purpose of this line is to furnish service to sub-stations at Brown Deer, Thiensville and Grafton.

Another 26,400 volt line of Wisconsin Electric Power Company extends from the Granville Sub-station south and west to Waukesha. This line supplements the lines serving Waukesha from West Allis and Lakeside and carries energy to communities located along the route, among which are Brookfield and Elm Grove.

3102 —1,451—

It also serves the County Line Sub-station which appears on Exhibit 32 in the immediate vicinity of the community of Elm Grove.

There are other 26,400 volt lines of Wisconsin Electric Power Company which are classified as transmission lines, but which, because of their short length and the density of what we have already shown on Exhibit 32, were omitted from the map.

For the most part, they serve as loop or parallel circuits to the circuits which I have described and it was felt

that their omission from the map would not detract from the extent of the coverage of the territory which is accomplished by the facilities shown.

Q. Have you referred to the line from Racine to Burlington? A. No, I haven't. I overlooked that one. That is a rather important line. That is, it is important in the operation of the transmission and distribution facilities in the Burlington district, particularly with respect to Wisconsin Gas & Electric Company.

This line extends from the Racine Sub-station southwest 3104
out of the city of Racine and then nearly due west past the communities of Sturtevant and Union Grove, at which points energy is delivered to sub-stations of Wisconsin Gas & Electric Company and then west and slightly south into

—1,452—

Burlington. This line is twenty-eight miles long and consists of number 1/0 copper conductors carried on wood poles. It is a single circuit line operating at 26,400 volts.

Q. And again, energy is delivered at Burlington through the system of Wisconsin Gas & Electric Company? A. Yes. Energy is delivered at the Burlington Sub-station for the 3105
use of Wisconsin Gas & Electric Company.

The Examiner: Let us have a recess of five minutes.

(Whereupon, a short recess was taken.)

By Mr. Hamilton:

Q. What is the circuit mileage in the transmission system of the Wisconsin Gas & Electric? A. The transmission

3106 system of Wisconsin Gas & Electric Company includes 401 miles of transmission circuits which are carried on 376 miles of wood pole lines. All of these lines operate at 26,400 volts except 6.6 miles of line which operate at 13,200 volts.

Q. Now, will you describe the principal transmission lines in the Wisconsin Gas & Electric Company system? A. Wisconsin Gas & Electric Company operates a double-circuit 26,400 volt line extending from Racine to Kenosha. It appears on Exhibit 32 as the line colored yellow, lying on the
3107 left of the one colored red between these two cities. This line is eleven miles long and consists of number 4/0 stranded

—1,453—

copper conductors.

It operates generally in parallel with the circuit of Wisconsin Electric Power Company extending between Racine and Kenosha.

The circuit from Kenosha to Burlington which is operated by Wisconsin Gas & Electric Company, is thirty-two miles long. Leaving Kenosha, it extends to the west and south
3108 through the communities of Pleasant Prairie and Salem and then extends northwest into Burlington.

Twenty-three miles of its length are made up of number four copper conductors and nine miles are five-sixteenth inch stranded steel cable. The entire length of the circuit is carried on a single line of wood poles.

This circuit takes energy which is delivered by Wisconsin Electric Power Company at the Kenosha Sub-station and delivers it to the communities through which it passes and to the Burlington Sub-station at certain times. At other times the circuit serves to take energy from the Burlington

Sub-station and deliver it to the communities located along the route.

Wisconsin Gas & Electric Company operates a 26,400 volt transmission circuit extending from Whitewater to Burlington. This circuit is thirty-nine miles long and consists of number two copper and number four copper conductors. The conductors are double, however. That is, there are two wires instead of one.

—1,454—

There are six wires carried on the poles, but it is operated 3110
as one circuit with double-conductors. The line receives energy from the Whitewater Sub-station of Wisconsin Gas & Electric Company and delivers it in the direction of Burlington, some of the energy actually reaching Burlington but most of it being taken off at the Elkhorn Sub-station and at the points of interconnection with Wisconsin Power & Light Company in Walworth County.

This circuit serves to complete a loop between Whitewater, Burlington, and St. Martins, utilizing the section of 132,000 volt line from Lakeside as one of the possible sources in serving this district. That is, it is possible to deliver 3111
energy to Burlington from Whitewater even though the other lines leading into the Burlington Sub-station should be interrupted.

Likewise, should service to this line be interrupted, the Burlington Sub-station could be served by the lines coming into it from the east and north.

Wisconsin Gas & Electric Company also operates a 26,400 volt circuit between the cities of Whitewater and Watertown. The one which I shall now describe is the more westerly one of the two connecting these cities.

It is thirty-two miles long and follows a route that passes through the city of Fort Atkinson and the community of Johnson Creek, then continues north into Watertown. It

—1,455—

consists of number two copper and number four copper conductors.

Here, again, the conductors are double, although the line operates as one circuit.

Another line between Whitewater and Watertown follows
3113 a more easterly route for a length of twenty-seven miles. It consists of number 1/0 copper conductors carried on wood poles. These two circuits operate in parallel between the cities of Whitewater and Watertown and serve to carry energy in either direction from the power sources at both points.

The power furnished at Whitewater and Watertown comes from the system of Wisconsin Electric Power Company.

A 26,400 volt circuit of Wisconsin Gas extends from the village of Waterloo, which appears in the northwest corner
3114 of Jefferson County, to a point known as Aztalan Junction, which is located at the junction of the transmission lines west of Johnson Creek.

The circuit is fifteen miles long and consists of number four copper conductors carried on wood poles. This circuit serves to carry energy from the system of Wisconsin Gas & Electric Company to the village of Waterloo which operates a municipal distribution system.

Wisconsin Gas & Electric Company also has a distribution sub-station at Waterloo which is used in serving rural territory in that general district.

—1,456—

3115

Another circuit of Wisconsin Gas & Electric Company extends from the line just described at a point south of Waterloo west through the community of Marshall, and south to the village of Deerfield where it feeds a sub-station serving the municipal distribution system of the village.

This circuit is ten miles long and consists of number two solid copper conductors on wood poles.

Another section of 26,400 volt line operated by Wisconsin Gas & Electric Company extends from the sub-station at Waterloo north and slightly east to the community of Reeseville, which does not appear on Exhibit 32, but is located at the junction of the lines southwest from the community of Lowell.

3116

This line is nineteen miles long, including the extension to Lowell, and consists of 3/0 aluminum and 4/0 aluminum conductors carried on wood poles.

Another section of line operated by Wisconsin Gas & Electric Company, but not owned by the company, extends from Watertown northwest to the junction southwest of Lowell. This line operates at 26,400 volts and is leased from Wisconsin Power & Light Company.

3117

Formerly, it was used by Wisconsin Power & Light Company in delivering the 25-cycle 66,000 volt energy which Wisconsin Electric Power Company purchased at Watertown.

Since the termination of the delivery of 25-cycle energy

to Wisconsin Electric Power Company at Watertown, Wisconsin Power & Light Company has had no use for this section of its line and is now leasing it to Wisconsin Gas & Electric Company.

3118 The line is shown on Exhibit 32 as a line operated by Wisconsin Gas & Electric Company, but I wanted to make it clear on the record that the showing of it on the map is not intended to convey the impression that the line is owned by Wisconsin Gas & Electric Company.

Another section of 26,400 volt line which is operated by Wisconsin Gas & Electric Company extends from the community of Jefferson east and south to the community of Rome, where a distribution sub-station is located.

3119 This circuit is eleven miles in length and consists of number two copper conductors carried on wood poles. It furnishes energy which is stepped down to distribution voltages at Rome and is distributed in the community and rural territory surrounding.

A 26,000 volt line extending from the Granville sub-station north and west to the community of Eden is operated by Wisconsin Gas & Electric Company.

This line passes through Menominee Falls, Addison, Theresa, Brownsville, and terminates in a short spur north of the community of Eden.

3120 Its total length is fifty-six miles. The conductors con-

sist of number two copper and number four copper wires which are carried on wood poles for the entire length of the circuit.

This line receives energy from Wisconsin Electric Power Company at the Granville Sub-station and transmits it to the various sub-stations located along the route.

A 26,000 volt line extending from the community of Lomira, which is located in the northeast corner of Dodge

County, to Kewaskum in the northern part of Washington County, is also operated by Wisconsin Gas & Electric Company.

This line is seventeen miles long and consists of number two copper wires carried on wood poles.

From Port Washington, a 26,400 volt line of Wisconsin Gas & Electric Company extends north through Belgium and Cedar Grove, then west through Random Lake and further west to a point north and slightly west of Kewaskum.

This circuit is thirty-four miles long and consists of 3122
number two copper conductors on wood poles for its entire length.

This circuit completes a transmission loop extending from Port Washington through Cedar Grove, through Lomira, Addison, and down to Granville, and makes it possible for Wisconsin Gas & Electric Company to render uninterrupted service to the communities located in this general district. There is also a 26,400 volt line between the city of West

—1,459—

Bend and the village of Addison, both in Washington County.
This circuit is ten miles long and consists of number 3123
two copper, carried on wood poles. A circuit is now under construction between the city of West Bend and the village of Kewaskum, as indicated by the dotted line in Exhibit 32. When this circuit is completed, it will complete another loop in the transmission circuit lying generally between West Bend and Lomira.

Q. What will be the voltage of that? A. The voltage of that line will be 26,400 volts. Wisconsin Gas & Electric Company also operates a 26,400 volt transmission circuit extending from West Bend to Port Washington.

3124 This circuit is eighteen miles long and has number 1/0 copper conductors. It serves as a source of supply for the West Bend district, the energy being received from Wisconsin Electric Power Company at the Port Washington sub-station.

Another transmission line of Wisconsin Gas & Electric Company extends from Port Washington south and west through Grafton, Cedarburg, Thiensville, and Brown Deer, and terminates at the territorial boundary line north of Milwaukee.

3125 This line is twenty-two miles long. The conductors are number two solid copper and are carried on wood poles.

The line is energized at either end at different times, sometimes receiving energy from the Fairmount Sub-station of Wisconsin Electric Power Company which is located

—1,460—

within the Milwaukee metropolitan area, and sometimes receiving energy at the Port Washington end.

It serves the communities of Grafton and Thiensville and adjacent territories.

Wisconsin Gas & Electric Company also operates a trans-
3126 mission line at 26,400 volts between the city of Menominee Falls and the village of Merton, both of which are in the northern portion of Waukesha County.

This line receives energy delivered to the system of Wisconsin Gas & Electric Company at the Granville Sub-station and carries it west through the communities of Sussex and Merton, serving those communities and adjacent areas.

When I gave the total mileage of transmission circuits operated by Wisconsin Gas & Electric Company a few moments ago, I stated that 6.6 miles of such circuits consisted of 13,200 volt line.

This line extends from the Elkhart Lake Sub-station to the city of Kiel located in the southwest corner of Manitowoc County.

This line consists of number two copper conductors carried on wood poles and serves the function of transmitting energy from the Elkhart Lake Sub-station of Wisconsin Gas & Electric Company to the municipal utility at Kiel.

It furnishes the only source of supply for the municipal

system. 3128

Q. And that line is energized how? A. It is interconnected with the system of Wisconsin Electric Power Company through the 132,000 volt sub-station of Wisconsin Gas & Electric Company at Elkhart Lake.

Q. You have indicated, I think, that these lines which you describe, are the principal transmission lines of Wisconsin Gas & Electric Company. A. Yes, they are the principal lines and if one were to add the mileages that I have given as the length of these respective lines, the total mileage would not equal the total mileage operated by Wisconsin Gas & Electric Company because there are some shorter 3129 circuits which I have not described.

The reason I haven't described them is the one I gave in connection with the Wisconsin Electric Power Company; namely, that they are shorter and serve generally as parallel or loop connections between these principal circuits, and that the circuits shown and described indicated in general the complete coverage of the territory made by the transmission system.

Q. What is the circuit mileage in the transmission system of Wisconsin Michigan Power Company? A. Wisconsin

3130 Michigan Power Company operates 845 miles of transmission lines. These lines operate at five different voltages.

—1,462—

147 miles of the transmission lines of Wisconsin Michigan Power Company operate at 132,000 volts. Of those, 137 miles are in Wisconsin and ten miles are in Michigan.

The 66,000 volt lines of Wisconsin Michigan Power Company have a total length of 221 miles, of which 51 miles are located in Wisconsin and 170 miles in Michigan.

3131 The 33,000 volt transmission lines of Wisconsin Michigan Power Company comprise a total length of 211 miles, all of which are in the state of Wisconsin, none being in Michigan.

Wisconsin Michigan Power Company operates 260 miles of 13,800 volt lines which are classified as transmission. Of these lines, 57 miles are in Wisconsin and 203 miles in Michigan.

The company also operates six miles of line at 11,400 volts which are classified as transmission lines.

3132 The total mileage of transmission lines operated by Wisconsin Michigan Power Company is made up of 456 miles in Wisconsin and 389 miles in Michigan, making a total of 845 miles.

Q. Now, will you describe the line running from Appleton easterly and then in the northerly direction on up into Dickinson County? A. The line you have just mentioned is the only 132,000 volt line owned and operated by Wisconsin Michigan Power Company.

—1,463—

Its total length is 147 miles. It was constructed in 1925 for the purpose of furnishing an interconnection between the power plants and transmission facilities in the northern portion of the company's territory and the power plants and transmission facilities in the southern portion.

The length of 147 miles which I have given, includes the tap or spur which extends east from the line in Marinette County to the two hydro-electric plants on the Menominee River.

The upper one of these plants is the Chalk Hill Plant 3134
and the lower is the White Rapids Plant which I described yesterday.

This line was constructed in three sections, one extending from Appleton to Green Bay, the second extending from Green Bay to Amberg, Wisconsin, which is located at the junction of the lines in Marinette County, and the other section extending from Amberg north into Michigan to the high-voltage sub-station at the Twin Falls hydro-electric plant north of Iron Mountain.

The first section extending from Appleton to Green Bay
and the third section extending from Amberg to Twin Falls 3135
consists of a single circuit of number 4/0 aluminum cable, reenforced, supported on one side of double-circuit steel towers.

—1,464—

The second section—before proceeding with the second section, I would like to add that the first and third sections were built by Wisconsin Michigan Power Company and were owned in total by the company at the time they were built.

The second section extending from Green Bay to Amberg consisted of number 4/0 aluminum cable, steel reenforced

3136 conductors, which were installed along with their insulators on the vacant side of a string of double-circuit steel towers which were at that time owned by Northern Electric Company, a predecessor to Northern Paper Mills which I mentioned yesterday as the firm from which the Chalk Hill and White Rapids hydro-electric plants were purchased by the company.

The company at that time leased conductor space from Northern Electric Company and installed its own insulators
3137 and conductors on the towers.

Q. When you say "company," you refer to Wisconsin Michigan Power Company? A. Wisconsin Michigan Power Company leased the conductor space and installed the conductors.

From Appleton to Forest Junction, which is the point east of Appleton at which the two lines part, one going north and one going south, the conductors are supported on the opposite side of the same towers which support the Lakeside-Appleton circuit of Wisconsin Electric Power Company.

3138 Over that length of line, a distance of fourteen miles,

—1,465—

the right-of-way and towers are owned jointly by Wisconsin Electric Power Company and Wisconsin Michigan Power Company.

The conductors and insulators are owned individually by the respective companies.

Now, prior to the construction of this line from Appleton to Twin Falls, the only outlet for the power generated

by the hydro-electric plants in the northern district was the market located within that district. That market was at times rather limited and as a result the hydro-electric plant wasted considerable water which was within their capacity to utilize, simply because they had no outlet for the power that the use of that water would have generated.

When the line was placed into operation, however, an outlet for that surplus of energy was provided and from that time on the plants have been able to utilize all available water within the capacity of their wheels, and have sent 3140
south over this transmission line all portions of their generation which has not been required for distribution in serving the loads in the northern division.

I made a study to ascertain the approximate extent to which the output of the plants in this region was increased through the construction and operation of this line. Using the output of the Twin Falls Plant as an indicator, I found that by comparing the two years preceding 1925 and the two years following 1925, that the output of the Twin Falls Plant

—1,466—

was increased between thirty-five and forty per cent. through 3141
the availability of an outlet for the energy above local requirements.

Now, in making that analysis, I included only the flow available in the Menomonee River up to the capacity of the wheels in the plant. Obviously, any flows above that could not be used by the plant whether it had a load or not. It could only utilize its wheel discharge capacity.

I also recognized the fact that the discharge of the stream within the capacity of the wheels was different in

3142 *Edward H. Schmidtman—By Respondents—Direct*

these four years that I considered in making the comparison, so that the increased output which was indicated by the study recognizes all the variables that were involved between the two years prior to the construction of the line and the two years following the construction of the line so that it can be said that the indicated increase in output is in no way due to any change in water conditions, but is due entirely to a change in market conditions.

3143 Now, using Twin Falls as a sample for all the plants in the area, and it is fairly representative with respect to stream flow characteristics and general relationship of output to stream flow, I find that the annual output which is being now realized in that area in excess of what was realized before, runs in the neighborhood of 30,000,000 kilowatt hours a year.

—1,467—

In 1926 and 1927, the first two years after the line went into operation, the records of Wisconsin Michigan Power Company and Wisconsin Electric Power Company, show that
3144 an average of 32,000,000 kilowatt hours were delivered to Wisconsin Electric Power Company through the operation of this line.

If that line had not been in place, that energy could not have been delivered by the plants and would have been wasted in the form of spilled water.

Q. Isn't it true that this line makes available to the Wisconsin-Michigan territory indicated on the map as centered about Appleton, electric energy generated by all the hydroelectric plants in the Wisconsin Michigan Power Company in the northern territory? A. Yes, it is possible for energy

generated at any of the plants in the northern portion of the Wisconsin Michigan Power Company system to be delivered to Appleton because the electrical connection between those plants and Appleton is continuous.

It would be impossible to say with any degree of certainty that kilowatt hours generated, for instance, at the Pine River Plant were delivered on the bus at Appleton because we can't identify kilowatt hours.

All of the energy generated in that northern system goes into a pool represented by the high-voltage transmission line 3146

—1,468—

and comes out of that pool at Appleton, but it is entirely possible for energy from any one of those plants to reach the Appleton load.

Q. And the same comment would equally be true of the Diesel engine plant at Iron River? A. In that case, it is possible, but less probable.

Q. Because of the output? A. Because of the nature of operation of the plant. The Diesel Plant at Iron River, as I explained yesterday, is operated only periodically and under sufficient load just to assure the operators that it is in 3147 operating condition and would be available if emergency required it; but the amount of energy it generates is so small that one would be fairly safe in saying that none of that energy would travel as far as Appleton.

It would be absorbed by the local loads.

Q. But it would get into the lines? A. It would get into the lines, yes, and theoretically it would be co-mingled with other kilowatt hours and might go to any part of the system.

Q. And because of the Wisconsin Electric Power Company line from Appleton, running down to Milwaukee, isn't

3148 it also possible that the power generated in this northern territory might come even farther down into the Wisconsin Electric and Wisconsin Gas territory indicated on the map as centering about Milwaukee? A. Yes, that is possible, and

—1,469—

we know it happens. That is, during the seasons of the year when the streams are running high in Michigan, the hydro-electric plants in the northern portion of the Wisconsin Michigan Power Company system operate at full capacity
3149 twenty-four hours a day for as much as three or four or even five weeks in the spring. During that period considerable quantities of energy are generated and are transmitted south over the line to Appleton and then on south into the system of the Wisconsin Electric Power Company.

Q. Now, is there a transmission line running from Twin Falls to Iron River, and is that line indicated on the map, Exhibit No. 32? A. The answer to both parts of your question is yes. The line you mentioned has its eastern terminus at the Twin Falls Plant located on the map north of the city of Iron Mountain.

3150 Beginning at that point and following the line to Iron River, one would cross the Menominee River at the Twin Falls Plant, entering Wisconsin, then following it northwesterly you would pass the community of Florence and then swinging still further to the northwest would cross the Brule River into Michigan to a point south of Alpha.

Then continuing westerly and northerly through the com-

—1,470—

munities of Caspian and into Iron River. That line is a double-circuit line operating at 66,000 volts.

The conductors are of various sizes including number 1/0 aluminum cable, steel reenforced, number 1/0 stranded copper, and number 2/0 stranded copper.

These conductors are supported on double-circuit steel towers.

The line was built in 1912 in the same year in which Peninsular Power Company built the Twin Falls hydro-electric plant. At that time also, Peninsular Power Company built a steam generating station in the city of Iron River. That steam station and the Twin Falls hydro-electric plant con- 3152
stituted the only sources of power of the Peninsular Power Company system at that time and the 66,000 volt line we are discussing was constructed to connect those sources and make them available to each other for coordinated operation.

During the seasons of high flow in the Menominee River and seasons of moderate flow, the Twin Falls Plant was able to generate enough power to carry most of the load of the system and a large part of its generation was transmitted in the direction of Iron River.

During seasons of deficient flow, the Twin Falls Plant 3153
generated as much as could be generated with the water available and its inadequate supply was made up by power generated in the steam plant at Iron River and that make-up energy was transmitted in the direction of Twin Falls.

This line was originally built on what were called black iron towers as distinguished from our present-day galvanized towers.

At that time, it had conductors of smaller sizes than those now in place. As load conditions improved and

greater transmission capacity was required, the conductors were changed to others of larger sizes and in 1928 the Wisconsin Michigan Power Company, which had meanwhile acquired the property of—correction—the Wisconsin Michigan Power Company which had meanwhile succeeded Peninsular Power Company, began a program of reconstructing the towers along the line.

The original towers were rusting rather badly and were considered unsafe, especially in view of the heavy conductors
3155 that had been strung on them. So a program was put under way to replace the old black iron towers with modern galvanized towers.

That program has not yet been completed but it is well along and is still under way. The substitution of the higher grade steel towers for the old iron ones will improve the stability of the line and the management feels that it is a step in the right direction towards increasing reliability of operation at that portion of the system.

Q. Have you given the length of that line? A. I don't
—1,472—
3156 think I did. The line is thirty-six miles long from Twin Falls Sub-station to the Iron River Sub-station.

Q. Now, is there a transmission line to Crystal Falls? A. Yes, there is a line which we refer to as the Crystal Falls Branch Line which extends from the vicinity of Crystal Falls south through the village of Alpha, and then south further a short distance to a point where it connects with the Twin Falls Iron River Line.

The Crystal Falls Branch line operates at 66,000 volts and has a total length of eight and a half miles. This line

was built in 1913 and furnished a supply of high-voltage energy to iron mines and other users in the Crystal Falls region.

As the loads served by this branch line increased, it was necessary to increase the carrying capacity of the line, so the conductors were replaced with others of larger size. As now constituted, the line consists of two circuits of number 1/0 aluminum cable, steel reenforced, from the junction with the Twin Falls-Iron River Line to Alpha and from Alpha to Crystal Falls it consists of one circuit of number 2/0 3158 aluminum cable, steel reenforced. The entire length of the line is carried on steel towers.

Mr. Hamilton: Is this an appropriate time to recess for lunch?

The Examiner: Yes, I think it is. We will recess until 2:00 o'clock.

—1,473—

(Whereupon, at 12:30 o'clock p. m., the hearing recessed until 2:00 o'clock p. m.)

3159

—1,474—

3160 *Edward H. Schmidtman—By Respondents—Direct*

AFTERNOON SESSION

(Whereupon, at 2:00 o'clock p. m., September 10, 1940, the hearing reconvened.)

The Examiner: You may proceed.

EDWARD H. SCHMIDTMAN the witness on the stand at the time of recess, resumed the stand, was examined and testified further as follows:

3161

Direct Examination by Mr. Hamilton (Continued):

Q. I believe you had finished describing the so-called Crystal Falls Branch transmission line. Are there other transmission lines in the territory in and about the Brule River and the Pine River? A. Yes, there are. As indicated on the map, Exhibit 32, there is one line connecting the Pine River hydro-electric plant with the 66,000 volt line extending from Twin Falls to Iron River.

This line was built at the time the Pine River Plant was built in 1922. It is six miles long and consists of two circuits 3162 of number three copper conductors carried on steel towers.

The other line which leads to the south and east from the Pine River hydro-electric plant is a lower voltage line which performs the function of carrying electrical energy to the community of Aurora and other districts in that portion

—1,475—

of the company's territory.

Another 66,000 volt tap line was built from the Brule River Plant to the Iron River-Crystal Falls line in 1919 at the time of construction of the Brule River Plant.

The map shows two lines extending from the Brule River hydro-electric plant, one leading southwest to the community of Florence, and the other leading southwest to a point nearer to the Wisconsin-Michigan boundary line.

The latter one of these two is the 66,000 volt line being described. The former operates at 6600 volts and serves to carry energy from the Brule River Plant to the community of Florence.

The 66,000 volt tap line consists of two circuits of number 1/0 aluminum cable, steel reenforced, carried on steel 3164
towers.

Both the Pine River Plant tap line and the Brule River tap line deliver energy from their respective plants into the 66,000 volt transmission system of Wisconsin Michigan Power Company.

Q. Now, there appears on Exhibit No. 32 a line running from Crystal Falls to Iron River. Will you describe that line? A. That line was built in 1929 for the purpose of forming a loop circuit between Crystal Falls and Iron River and the Iron River-Twin Falls transmission line.

—1,476— 3165

It consists of a single circuit of number two copper conductors carried on wood poles and operating at 66,000 volts.

This line is fourteen miles long.

The loads in the Crystal Falls area had shown considerable growth subsequent to the construction of the Crystal Falls branch line and it was felt that it would be wiser to meet those increasing needs by construction of the line to Iron River than by increasing the capacity of the Crystal Falls branch line.

3166 Q. And from Iron River running in a southwesterly direction, there appears still another line on the map. Will you describe it? A. This line, as shown on the map, leads from the sub-station at Iron River southwesterly into Wisconsin, then west through Phelps, and north back into Michigan, passing through the communities of Land-o-Lakes, and Watersmeet, and terminating at the 66,000 volt sub-station at Bruces Crossing.

This line consists of one circuit of number 1/0 aluminum
3167 cable, steel reenforced, carried on wood poles. The length is sixty-five miles from Iron River to Bruces Crossing.

The purpose of constructing the line, which was built in 1929, was to furnish power to new territory which was being developed by Wisconsin Michigan Power Company at that time.

This line carries energy which it receives at Iron River

—1,477—

up to the Bruces Crossing Sub-station where it is stepped down to lower voltages for transmission and distribution over the lines emanating from that point.

3168 It also furnishes energy to sub-stations located at Phelps, Land-o-Lakes, and Watersmeet.

Q. Will you describe the Twin Falls-Cornell transmission line? A. The 66,000 volt line extending from Twin Falls to Cornell travels in a northerly direction from Twin Falls and then turns east at a point near Sagola, which is not named on the map, continues east through the community of Felch, and then bears southeasterly, terminating at Cornell, where a 66,000 volt sub-station of the Wisconsin Michigan Power Company is located.

This line has one circuit of number 1/0 copper conductors and is carried on wood poles. It has a total length of fifty-two miles.

It was built in 1931 for the purpose of serving new territory that was being developed by the company in the eastern portion of the Michigan electric territory.

It delivers energy to the distribution sub-station at Felch and to the transmission sub-station at Cornell. The Cornell sub-station steps the voltage down to 13,800 volts for delivery to the line which extends to the north and east from 3170
—1,478—
Cornell, with a spur to Perkins and terminating at Trenary.

The Cornell sub-station also supplies energy to a 13,800 volt line which extends to the west along the route of the 66,000 volt line to Cornell, and then turns south connecting with a 13,800 volt line extending east from Iron Mountain and passing through Norway and Loretto, and Spalding, terminating at Bark River.

The latter line is the one to which the Sturgeon River hydro-electric plant shown on the map near the community of Loretto delivers its output at 13,800 volts. That portion 3171 of the output of this plant, which is not consumed on the easterly portion of this 13,800 volt line, is delivered to the sub-station at Iron Mountain and Twin Falls and thence finds its way into the 66,000 volt system or into the 132,000 volt system.

Q. East of the town of Felch on the map appears the line which ultimately runs up to form an interconnection with the Cliffs Power & Light Company. Will you describe that line? A. That line is referred to as the Gwinn Line, inas-

3172 much as the interconnection with the system of Cliffs Power & Light Company is made at a locality named Gwinn.

This line branches from the 66,000 volt line extending between Twin Falls and Cornell. It operates at 66,000 volts and consists of one circuit of number 1/0 copper conductors

—1,479—

carried on wood poles.

The total length of this line is twenty-eight miles. It was
3173 built in 1937 to effect an interconnection between the systems of Wisconsin Michigan Power Company and Cliffs Power & Light Company.

The interchange between these companies through this interconnection makes it possible for Wisconsin Michigan Power Company to obtain energy from Cliffs Power & Light Company for use in its Michigan distribution system and to also furnish Cliffs Power & Light Company with energy generated in the Michigan plants of Wisconsin Michigan Power Company.

Q. Now, have you described all the transmission lines
3174 located generally in this northern territory? A. Yes, I believe I have described all the transmission lines located in this portion of the company's territory. There may be some short lengths which I haven't singled out individually, but I have covered the principal lines in the transmission system of this part of the company's property.

Q. Now, in that portion of the territory served, centering around Appleton, what transmission lines are there? A. The transmission lines in the southern portion of the territory of Wisconsin Michigan Power Company have a total

length of 211 miles of 33,000 volt line, fifty-six miles of 13,800 volt line, twelve miles of which are carried on steel

—1,480—

towers and the remainder on wood poles.

The principal line in this portion of the system is the one shown on the map beginning at Appleton and extending straight north for a distance, then turning northwesterly and resuming its northward travel to the community of Bonduel. At that point the line turns west and north to Shawano. 3176 There it continues westerly and southerly to a point of interconnection with the system of Wisconsin Power & Light Company near the city of Clintonville, which being outside of the territory served by Wisconsin Michigan Power Company, is not located on the map.

From Clintonville, the line continues southerly to the city of New London where interconnection is made with the municipal distribution system. There it turns east and south through the community of Hortonville, and then turns west again returning to Appleton.

This line forms a complete loop—— 3177

Q. (Interposing) It turns east, I think, to Appleton. A. It turns east to Appleton, yes. This line forms a complete loop which, together with the branch lines reaching from it at the same voltage of 33,000 volts, comprise a total length of 156 miles.

This loop is the backbone of the southern transmission system of the company. It consists of copper conductors of various sizes, ranging from number four to 1/0.

—1,481—

3178 One branch which operates at 13,800 volts, connects the sub-station at Bonduel with Wisconsin Michigan Power Company's hydro-electric plant at Oconto Falls.

Another branch operating at 13,800 volts runs west from the junction near the community called Dale, near Appleton, through Readsfield and Fremont, to Weyauwega hydro-electric plant of the Wisconsin Michigan Power Company.

There is another 33,000 volt loop in this portion of the company's transmission system. This loop extends from
3179 Appleton to the south through the cities of Menasha and Neenah and then returns to Appleton by a more westerly route.

The length of this loop is thirteen miles, about half of which is carried on steel towers. The section that is carried on steel towers has been designed to operate at 66,000 volts.

The towers have the proper conductor spacing for that voltage and the insulators for that voltage are in place, but the line is presently being operated at 33,000 volts.

Another 33,000 volt line in the southern portion of the
3180 company's system is the one extending from Appleton easterly and southerly to the community of Hilbert. This line is thirty-six miles long and consists of five miles of number two copper conductors on steel towers, and thirty-one miles of number two and number four copper conductors on wood poles.

—1,482—

I believe I made a misstatement. I meant to say that five miles of this line consisted of number 2/0 copper conductors on steel towers.

3181

Q. Have you given the capacity of the transmission line running from Twin Falls to Appleton? A. I don't remember that I did, but the normal operating capacity of the line—that is, the load which the line will carry under satisfactory conditions of voltage regulation—is between 25,000 and 30,000 kilowatts on the section between Twin Falls and Appleton.

The section betwen Appleton and Lakeside, likewise, has a capacity of approximately twenty-five or thirty thousand kilowatts for this length of line alone, but if the two sections, 3182
namely, the one from Lakeside to Appleton, and from Appleton to Twin Falls, are considered in total, a load of between 15,000 and 20,000 kilowatts is about all the line will carry with satisfactory voltage regulation.

The load-carrying capacity of this line can be increased during heavy load conditions by supplying certain quantities of wattless current from the Appleton steam plant, or by maintaining a high power factor at the Milwaukee end by means of leading current from the power plants there, and that is why I have given the carrying capacity of this line as being about the figures I have given, rather than specific 3183
amounts.

Q. What are the principal transmission sub-stations of

the Wisconsin Electric Power Company? A. The Wisconsin Electric Power Company has only three sub-stations which are classified as transmission. All three of these are shown on Exhibit 32.

One of them is the sub-station at the Lakeside Power Plant. This sub-station consists of two sections. One sec-

tion raises the voltage from the generator voltage of 13,200 to 26,400 volts. This section has a capacity of 60,000 k. v. a. and is used to step up the voltage of that portion of the output of the Lakeside Plant which is sent out through the 26,400 volt lines emanating from the Lakeside Sub-station.

I described some of those lines this morning. Certain others of them are considered distribution lines inasmuch as they lead from the power plant directly into the city of Milwaukee and serve distribution sub-stations which are scat-
3185 tered all over the city to feed the distribution system.

The other section of the Lakeside Sub-station raises the voltage from 13,200 volts to 132,000 volts. This section has a capacity of 240,000 k. v. a. and performs the function of raising the voltage of that part of the output of the Lakeside Plant which is sent out on the 132,000 volt transmission lines.

As the capacities of the two sections of the sub-station would indicate, the latter section handles the major portion of the output of the plant.

—1,484—

Another transmission sub-station of Wisconsin Electric
3186 Power Company is the one located at Granville which I mentioned previously in connection with the operation of the transmission lines.

The Granville sub-station operates between the voltages of 26,400 and 132,000. Its principal function is to step down the voltage of 132,000 volt energy which it receives either from the Port Washington Power Plant or from Appleton or from the Lakeside Plant, to 26,400 volts for delivery to either the line of Wisconsin Gas & Electric Company which leads to Menomonee Falls from Granville, or to the numer-

ous 26,400 volt circuits of Wisconsin Electric Power Company which are supplied by the Granville Station.

The third transmission sub-station of Wisconsin Electric Power Company is the one located at the Port Washington power plant. It, likewise, has two sections, one of 20,000 k. v. a. raises the voltage from 22,000 volts to 26,400 volts. 22,000 volts is the voltage at which the generator in the Port Washington plant operates.

The output of this section of the Port Washington Sub-station is delivered to the 26,400 volt lines of the Wisconsin 3188
Electric Power Company and Wisconsin Gas & Electric Company which connect with the stations.

The other section of the Port Washington Sub-station raises the voltage from 22,000 volts to 132,000 volts. This

—1,485—

section has a capacity of 90,000 k. v. a. and serves to deliver the output of the plant to the 132,000 volt transmission lines which connect with the main transmission system of Wisconsin Electric Power Company.

Q. Those are the three transmission sub-stations. How many distribution sub-stations are there? A. Wisconsin 3189
Electric Power Company has fifty-six distribution sub-stations which has a total combined capacity of 470,147 k. v. a. By the term "distribution sub-station" I mean a sub-station which is used in lowering the voltage of energy from a transmission voltage to a voltage suitable for supply to the distribution system of the company.

Our transmission sub-stations are classified as such because they perform the function of raising the voltage for delivery to a transmission line.

3190 Measured in similar terms, a distribution sub-station is one which transforms energy for delivery to a distribution line.

Now, these fifty-six sub-stations all perform that function. Forty-one of them perform the additional function of converting alternating current energy into direct current energy by means of rotary converters or mercury arc rectifiers, or motor generator sets.

The total capacity of such conversion equipment located
3191 in these forty-one sub-stations is 106,240 k. v. a.

—1,486—

The total transformer capacity of all the sub-stations of Wisconsin Electric Power Company is 970,147 k. v. a.

Q. The sub-stations you have referred to as distribution sub-stations are not shown on Exhibit No. 32? A. Some of them are, but not all of them. In preparing Exhibit 32, we have shown only the sub-stations which are among the larger ones of the company.

The smaller ones have not been indicated because it was felt the map would be made unduly complicated and the
3192 information on it a little too dense for the map to be used conveniently.

If all the sub-stations of Wisconsin Electric Power Company were to be shown, the map would be thoroughly sprinkled with them and I doubt that there would be room within the area of Milwaukee, for instance, to show them all.

Q. What are the principal sub-stations of the Wisconsin Gas & Electric Company? A. The principal sub-stations of Wisconsin Gas & Electric Company are that company's transmission sub-stations, of which there are three.

3193

One is located at Elkhart Lake in the northern portion of the territory served by Wisconsin Gas & Electric Company. This sub-station steps down energy from a voltage of 132,000 volts to 13,200 volts and 4,800 volts.

The transformer bank, delivering energy at 13,200 volts,

—1,487—

furnishes power to the 13,200 volt transmission line extending from Elkhart Lake to Kiel, and the bank transforming to 4,800 volts serves to supply energy for distribution in this portion of the territory of the Wisconsin Gas & Electric Company.

3194

Another of the transmission sub-stations of Wisconsin Gas & Electric Company is located in the city of Kenosha. It is known as the Albers Street Sub-station which I mentioned in connection with the operation of the transmission lines. This sub-station has a capacity of 60,000 k. v. a. and transforms energy from a voltage of 132,000 volts to one of 26,400 volts. The function of this sub-station is to receive high voltage power from the lines of Wisconsin Electric Power Company and transform it to a voltage suitable for delivery to the transmission system of Wisconsin Gas & Electric Company.

3195

The third transmission sub-station of Wisconsin Gas & Electric Company is the one located at Whitewater. This sub-station has a capacity of 10,000 k. v. a. and serves to transform energy from a voltage of 132,000 volts to one of 26,400 volts. It receives high voltage energy from the 132,000 volt transmission system of Wisconsin Electric Power Company and transforms that energy to 26,400 volts for delivery to the three lines of Wisconsin Gas of that

3196 voltage which receive power from the Whitewater sub-station.

In addition to these three transmission sub-stations,

—1,488—

Wisconsin Gas & Electric Company also has thirty distribution sub-stations. These distribution sub-stations are located at various points in the territory served by the company and the principal ones among them have been indicated in Exhibit 32.

3197 The total capacity of the thirty distribution sub-stations is 51,173 k. v. a.

Q. How many transmission sub-stations does Wisconsin Michigan Power Company have? A. Wisconsin Michigan Power Company has twenty-four transmission sub-stations.

These have a combined capacity of 129,025 k. v. a. Eleven of them are located at the power plants of the company and all of the eleven are shown on the map.

Of those located at the power plants, one is at the Twin Falls Station, one at Quinnesec Falls Plant, one at White Rapids Plant, one at Chalk Hill Plant, one at the Brule
3198 Plant, one at the Sturgeon Plant, one at the Pine River Plant, one at the Appleton Power Plant, one at the Weyauwega hydro-electric plant, and one at the Oconto Falls hydro-electric plant.

The other thirteen transmission sub-stations are located at various points on the transmission system of the company and are all shown on the map.

The total capacity of these twenty-four transmission sub-stations—I have given that—is 129,025 k. v. a.

—1,489—

The Wisconsin Michigan Power Company also operates thirty-five distribution sub-stations with a total capacity of 17,930 k. v. a. and 49 other distribution sub-stations which have been constructed for individual customers.

They are classified as customers' sub-stations. These 49 have a combined capacity of 34,236 k. v. a.

May I add the Iron River Sub-station to the list of transmission sub-stations located at power plants of the Wisconsin Michigan Power Company?

Q. Iron River Sub-station being the eleventh in that list? 3200
A. Yes.

Q. What is the extent in line miles of the distribution system of the Wisconsin Electric Power Company? A. Would you repeat that question, please?

(Whereupon, the pending question was read.)

The Witness: Wisconsin Electric Power Company operates a distribution system comprising 2,738 miles of pole line and 173 miles of underground line.

These lengths of line are as of December 31, 1939. 3201
At that date, the system of Wisconsin Electric Power Company was serving 250,770 customers through 273,995 electric service meters.

The distribution system includes 17,511 line transformers having a combined capacity of 268,795 k. v. a.

—1,490—

This extensive system has been carefully designed and constructed so as to maintain high quality of service at minimum investment and operating expense.

3202 The policy of the management with respect to distribution functions, as well as other functions, has been to improve the system and the operating practices as much as would be consistent with good economy and good service.

A number of years ago a program directed toward the limitation of 250-volt direct current service was undertaken. This class of service was the first electric service to be rendered to the public in Milwaukee
3203 and has been continued down to the present time.

Some of that service is still being rendered.

Because of the greater expense of operating the 250-volt direct current system, a decision to minimize the service with the idea of eventually eliminating it entirely, has been carried out.

The direct current area served by Wisconsin Electric Power Company covers a space of between one and two square miles in the center of the downtown district of the city of Milwaukee. The outlines of the area are not definite because there are certain streets
3204 in which the direct current cables were laid in the streets years ago and are still in service while subsequently alternating current lines have been erected on poles in the alleys.

—1,491—

In many of those instances, one customer will take direct current service and his next door neighbor will take alternating current service.

Then, another reason why the outline of the direct current area is not definite is because of the program

which the company is engaged in to minimize that type of service, direct or alternating current customers are located practically all the way through the direct current area. They are being served from a low-voltage network which has been in operation for several years and is being enlarged as rapidly as the increasing demands on it will justify.

It is the policy of Wisconsin Electric Power Company to not add any new customers to the direct current system unless there are technical reasons why 3206
the customer must have that service.

If it is possible to serve him reasonably from the alternating current system, he will not be given the direct current.

Likewise, any present customers who are now taking direct current service and who wish to expand their consumption, are urged by the company to make their expansion in such a way as to utilize alternating current for the additional load.

I stated this morning that the program has been under way for some years for a reduction and even- 3207
tual elimination of 25-cycle service on the system of the Wisconsin Electric Power Company.

—1,492—

That has been carried to the point where we now no longer purchase 25-cycle power from Wisconsin Power & Light Company and the only 25-cycle energy that is now used on the system is that delivered to a few industrial 25-cycle customers and a small amount which is used in converters which convert the 25-cycle energy for railway use.

3208 *Colloquy*

The original use for the 25-cycle energy which was purchased from the Wisconsin Power & Light Company was that of conversion for railway consumption.

As a result of that, a number of the railway sub-stations which are still in operation are equipped to receive 25-cycle energy and inasmuch as the management hasn't felt that it is the time to change over all those 25-cycle sub-stations, it is necessary to continue some 25-cycle generation on the system for those sub-
3209 stations as well as for the few 25-cycle customers that we still have.

The reduction in the use of 25-cycle service has made it possible to take out of service those engine-driven 25-cycle generators at the Commerce Plant and has also made it possible to change over three of the manually operated 25-cycle railway sub-stations to automatic 60-cycle rotary converter installations.

Appreciable economies have been realized by making these changes. Such economies are quite evident from the reduction in the number of pieces of equip-
3210 —1,493—
ment that have to be operated, the number of circuits that have to be provided and maintained, and the amount of different kinds of reserve capacity which must be held in readiness to furnish continuous service to any of these various classes.

That is, service to 25-cycle customers must be validated by 25-cycle reserve capacity.

The same holds true with respect to 250 volt direct current service. A number of separate circuits

have also been eliminated through this standardization of service and we have come to feel that this program for standardizing on 60-cycle service has been in a way, if you please, an integration of class of service.

That is, we have concentrated on one type and are looking forward to the time when that will be not only the predominating type of service on the system, but the only one.

Q. What is the extent in line miles of the distribution 3212
system of the Wisconsin Gas & Electric Company? A. Wisconsin Gas & Electric Company operates a distribution system including 4,740 miles of pole line and 31 miles of underground line. This system serves directly 65,724 customers.

Q. And your figures, again, are at December 31, 1939? A. Yes, they are.

In serving these customers, the company makes use of

72,426 electric service meters and 18,249 line transformers which have a total capacity of 107,727 k. v. a.

The distribution lines of Wisconsin Gas & Electric Com- 3213
pany form a close network within the areas through which its transmission lines pass.

The sub-stations have been located so as to serve the greatest area that could be served economically from given locations, the purpose being economy of construction and simplicity of operation.

Q. None of these distribution lines are shown on Exhibit No. 32? A. No, none of the distribution lines of Wisconsin G & Electric Company are shown.

Q. Or of Wisconsin Electric Power Company? A. Some of the lines shown for Wisconsin Electric Power Company are classified as distribution. They have been shown on the map, as I pointed out previously, in order to indicate the routes by which service is taken to the various communities shown.

Some of the smaller communities are served by lines which, for accounting purposes, have been classified as distribution lines.

Inasmuch as we did not prepare a distribution line map of the systems we felt it desirable to indicate on here those distribution lines which reach communities that are served

within the territory.

A distribution line map drawn on the scale of Exhibit 32 would be almost physically impossible to prepare, because of the closeness of the lines to each other.

The area shown to indicate the city limits of the city of Milwaukee would be colored solid black. The lines would touch each other, and in the area served by Wisconsin Gas & Electric Company in many instances there are as many as a dozen lines traveling in parallel directions within a mile. You can see from that, that with a scale of ten miles to an inch, the lines would be closer together in some places than the cross-hatching on the map.

Q. Will you give the comparable data on the distribution system of the Wisconsin Michigan Power Company? A. The distribution system of the Wisconsin Michigan Power Company includes 3,112 miles of overhead pole lines. None of the distribution lines of Wisconsin Michigan Power Company are carried in underground conduit.

The system serves 36,297 customers through 40,129 electric service meters.

Here, again, the data on length of line, number of transformers, and number of meters applies to the end of the year 1939.

Q. And electric customers, also? A. And electric customers, yes.

—1,496—

The distribution system of Wisconsin Michigan Power Company has been expanded and its capacity increased as 3218
the loads have grown in the communities in the territory served. A number of small electric systems were acquired by the company and merged in 1927.

For the most part, those systems consisted of lines in very poor state of repair, constructed according to very low construction standards, and had to be completely revamped in order to meet the company's service requirements.

In many instances, the entire systems were replaced from end to end. Poles and wire transformers, and especially in the case of street lighting equipment, where many of the 3219
units were the old-fashioned tin-plate reflectors with bare electric bulbs, complete replacements were made by the company.

The same situation applies to the small systems acquired from time to time by Wisconsin Electric Power Company and Wisconsin Gas & Electric Company, and after the acquisitions had been made and the systems revamped to meet the construction standards and service standards of the companies, the quality of service was materially improved

3220 *Edward H. Schmidtman—By Respondents—Direct*

and the volume of service taken by the customers showed material growth.

Wisconsin Michigan Power Company has also carried on a vigorous rural electrification program which has resulted in the construction of many miles of rural distribution lines.

These rural lines reach into all portions of the electric

—1,497—

service area of the company except some of the unsettled
3221 sections in the upper pensinsula of Michigan where there are extensive areas of logged-over forest land with few or no inhabitants.

The remarks I made about the vigorous rural electrification program of Wisconsin Michigan Power Company applies with equal force to Wisconsin Electric Power Company and Wisconsin Gas & Electric Company.

In the case of the latter company, particularly, an active program for increasing the use of electricity by rural customers has been carried out over a period of years and the use of the service in the territories of Wisconsin Gas &
3222 Electric Company and Wisconsin Electric Power Company is among the highest in the state of Wisconsin, and likewise among the highest in comparable areas in the United States.

Q. What is the book value of the gas utility property of the Wisconsin Gas & Electric Company? A. As of December 31, 1939, the book value of the gas plant in service of Wisconsin Gas & Electric Company was $11,819,234.00.

Q. That figure is before depreciation, is it? A. Yes, that figure is before depreciation.

3223

Q. Will you describe very briefly the gas production equipment or plants operated by Wisconsin Gas & Electric Company? A. Wisconsin Gas & Electric Company oper-

—1,498—

ates gas plants at three different locations.

There are two plants in the city of Racine, one of which produces coke oven gas and has a rated capacity of 8,500 m. c. f. gas per day, and the other of which produces water gas and has a rated capacity of 2,225 m. c. f. per day.

3224

The two other plants of Wisconsin Gas & Electric Company are located in the cities of Waukesha and Fort Atkinson. They are both water gas sets, the one at Waukesha having a rated capacity of 800 m. c. f. per day and the one at Fort Atkinson having a rating of 250 m. c. f. per day.

The Waukesha and Fort Atkinson Plants and the Racine water gas plant are not in regular operation.

The coke oven gas plant at Racine produces the gas which is transmitted and distributed over the gas system of Wisconsin Gas & Electric Company.

3225

Q. Will you locate the gas holders owned by Wisconsin Gas & Electric Company? A. Wisconsin Gas & Electric Company owns twelve gas holders whose location is shown on Exhibit 32. One is at Racine, and is designated by the open square containing the diagonal cross. This one—or rather I should say there are four holders at Racine, all designated by this one symbol.

These four holders have a combined storage capacity of 4,550 m. c. f.

—1,499—

At Kenosha there is another gas holder with a capacity of 1,000 m. c. f. It is also shown on the map.

The gas holder shown at Fort Atkinson, or rather, the symbol shown at Fort Atkinson, represents two small gas holders with a combined storage capacity of 130 m. c. f.

The symbol at the city of Watertown represents two holders also with a combined capacity of 190 mcf.

The gas holder symbol shown at Waukesha designates three individual holders with a composite capacity of 650 m. c. f. These gas holders are used regularly in the operation of the company's gas transmission and distribution system.

3227 The ones at Racine, of course, are used to store the gas immediately upon its manufacture. Those at the other points on the system are used as equalizers to carry the local gas consumption peaks on the various portions of the system during the day.

Q. There appear then, to be five locations and a total of twelve holders in the system? A. Yes, that is right. There are a total of twelve holders in the system located at five different points within the gas service territory.

Q. Will you state the number of miles of gas transmission mains operated by the Wisconsin Gas & Electric Company?

3228 A. Wisconsin Gas & Electric Company operates a gas trans- —1,500—
mission system comprising 280 miles of high-pressure transmission mains.

The location of these mains is shown in Exhibit 32 by the dashed line colored in yellow. 16.7 miles of these mains are three inches in diameter. 114.5 miles are four inches in diameter. 94.6 miles are six inches in diameter. 40.4 miles are eight inches in diameter, and 13.8 miles are ten inches in diameter.

3229

This gas transmission system utilizes in its operation six gas pumping stations located at various points on the system. These pumping stations have a combined capacity of 600 m. c. f. of gas per hour. They are necessary in the operation of the system in order to maintain the pressure in the lines and to offset the loss of pressure resulting from friction due to the flow of the gas through the pipes.

The high-pressure mains for the most part are laid underground along highways or along railroad lines, and they come over the ground only where the lines cross deep ravines or some other obstruction of that kind that makes it simpler to come overground than stay underground.

3230

For a considerable portion of the distance between Racine and Milwaukee, the high-pressure gas transmission line of the Wisconsin Gas & Electric Company is laid inside the electric interurban right-of-way of the Milwaukee Railway and Transport Company by putting the line in that right-of-way and paying a rental based upon the cost of the right-

—1,501—

of-way, the Wisconsin Gas & Electric Company was able to effect a considerable saving in right-of-way costs along that section of the line because that is a relatively heavily settled district and the people in that area are quite land conscious or right-of-way conscious, and rights-of-way in there are extremely expensive.

3231

The Examiner: Let us have a little recess.

(Whereupon a short recess was taken.)

—1,502—

The Examiner: You may proceed.

3232 *Edward H. Schmidtman—By Respondents—Direct*

By Mr. Hamilton:

Q. Had you finished your description of gas transmission lines? A. Yes, I have.

Q. Will you state the extent of the gas distribution mains operated by Wisconsin Gas & Electric Company? A. The gas distribution system of Wisconsin Gas & Electric Company includes both low pressure mains and high pressure mains. Of low pressure, cast-iron mains, ranging in size
3233 from three inches to thirty inches diameter, the system includes 1,537,299 feet.

Other low pressure mains made of wrought iron or steel and varying in diameter from one inch to sixteen inches comprise a total length of 325,638 feet.

The high pressure mains, all of which are steel pipe, ranging in size from ¾ inch to 4 inches constitute a total length of 1,358,961 feet.

This latter class of high pressure mains are those indicated—correction—the total combined length of all distribution mains is a trifle over 610 miles.

3234 Q. Now, can you state the number of services which the Company furnishes? A. The gas distribution system of Wisconsin Gas & Electric Company, in addition to the mains by which it distributes the gas, also includes 58,174 service

connections. A gas service connection is the length of pipe which runs from the gas main in the street to the property, for the purpose of delivering gas to the individual customers premises.

Of the total number of services in the gas distribution system of Wisconsin Gas & Electric Company, 49,393 are

in active use and extend all the way from the main to the customer's meter.

8,781 of the services of the Company extend only from the main to the curb and are held for future use. These curb services are installed at the time the mains are laid, because it is more economical to install them at that time, when the men and equipment are on the job, than it is to leave them until later, when the installation of a service from the main to the curb might involve digging up the pavement.

The average number of customers served during the year 3236
1939, by the gas distribution system of Wisconsin Gas & Electric Company, was 50,774. Of these, 47,696 were residential customers, using gas for cooking and water heating. 185 of them were residential customers using gas for space heating. 2,765 were commercial customers using gas for purposes other than space heating—largely for cooking and water heating—and 30 were commercial customers using gas for heating purposes.

—1,505—

98 of the total were customers making use of gas for 3237
industrial purposes.

These customers were served through a total of 51,702 gas service meters, of which 51,659 are regular meters and 43 are prepayment meters—the type in which the customer must deposit a coin before he can take any gas.

Q. What is the book value of the gas utility property of Wisconsin Michigan Power Company? A. The book value, before depreciation, of the gas utility plant in service of Wisconsin Michigan Power Company, as of December 31, 1939, was $2,373,255.00.

Q. And its production equipment? A. This gas utility plant includes production equipment which consists of a gas plant located in the city of Appleton.

The plant has a total capacity of 1,860 M. C. F. per day, of which 900 M. C. F. per day capacity is from coal gas, and 960 M. C. F. is from a water gas set.

Q. And its holder capacity? A. Wisconsin Michigan Power Company also has four gas holders, three of them located at the location of the Appleton gas production plant,
3239 with a storage capacity of 651 M. C. F., and one located in the city of Neenah, having a capacity of 200 M. C. F.

The gas production equipment at Appleton and the gas

holder at Neenah are connected by means of a high pressure wrought iron transmission main.

The total length of this main is 6.4 miles, of which one mile has a diameter of four inches, and 5.4 miles has a diameter of six inches.

Q. And the Company's distribution mains are how extensive? A. The low pressure distribution mains of Wisconsin Michigan Power Company vary in size from below one
3240 inch to 16 inches in diameter. These have a total length of 531,899 feet.

The high pressure mains, varying in size from one inch or less to eight inches, have a total length of 104,973 feet. The total length of all distribution mains, both high pressure and low pressure, in the gas distribution system of Wisconsin Michigan Power Company, is nearly 121 miles.

Q. And again, if you will, the number of services which the Company maintains? A. There are a total of 10,595 gas

services connected to the gas distribution mains of Wisconsin Michigan Power Company.

Of these, 10,310 are in active use and 285 are main-to-curb services held for future use.

These services deliver gas to customers who, during the year 1935, averaged 9,234 in number.

—1,507—

Q. 1939? A. 1939 is correct.

The residential consumers constituted 8,742 of this number, the commercial consumers 463, and the industrial consumers 29. 3242

These 9,234 gas customers were served through 9,257 gas service meters.

Q. Turning, now, very briefly, to the heating business furnished by Wisconsin Electric Power Company, can you state the book value of this plant in service devoted to the heating business? A. The book value of the plant in service of Wisconsin Electric Power Company, devoted to the steam heating business, as of December 31, 1939, was $2,996,436.00 before depreciation. This figure includes the book value of the property used entirely in the heating business, as well as in apportionment of the book value of the power plants which generate steam for heating purposes, as well as producing electricity for distribution. 3243

The distribution mains—steam distribution mains—of Wisconsin Electric Power Company have a combined length of 111,857 feet, and they serve a total of 984 steam heating customers.

Of these customers 32 are residential and 952 are commercial.

—1,508—

The figures I have just given on length of mains and number of customers apply to the end of 1939.

Q. Will you give comparable data for the steam heating business of Wisconsin Gas & Electric Company? A. Wisconsin Gas & Electric Company operates a small steam heating business in the city of Waukesha. The book value of the heating plant in service as of the end of 1939, again including apportionment of power plant investment allocated to the generation of steam for heating operations, was $193,
3245 935.00.

The distribution mains in Waukesha, at that same date, had a total length of 7,115 feet and served a total of 204 customers, of whom 40 were residential and 164 were commercial.

Q. The heating business is confined to Waukesha, is it? A. Yes, it is.

Q. In their operations, are the generating and transmission systems of the three companies coordinated? By "three companies", I mean Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, Wisconsin Michigan
3246 Power Company. A. Yes. The operations of the power production and transmission facilities of all three companies are well coordinated.

—1,509—

The plants of each company are operated on a somewhat divisional basis. That is, they are operated primarily in meeting loads of the systems served by the respective company's plants, and further than that, whenever there is a possibility of coordinating the operations of the plants of one company with the operations of the plants of the other, ad-

vantage is taken of those opportunities in order to give the most effective over-all operation of the entire system.

Q. Have you data as to the percentages of kilowatt hours generated, taking the statistics of the three companies together? A. Yes, I have. In the year 1939 the power generation facilities of the three companies of the Wisconsin Michigan group produced a net output of 1,504,874,726 kilowatt hours.

Of that total, generation in the steam power plants of Wisconsin Electric Power Company contributed 1,277,278,- 3248
698 kilowatt hours, or 84.9 per cent. of the total for the three companies.

The plants of Wisconsin Gas & Electric Company delivered a net output of 1,241,584 kilowatt hours, or slightly less than one-tenth of one per cent. of the total.

The plants of Wisconsin Michigan Power Company produced 226,354,444 kilowatt hours of net generation, which was 15 per cent. of the combined total.

—1,510—

The generation which I have just given for the plants of Wisconsin Electric Power Company was all produced by 3249
steam. That generated by the plants of Wisconsin Gas & Electric Company is entirely hydro-electric generation, produced in the three hydro-electric plants of that company.

The net output of Wisconsin Michigan Power Company is made up of three types of generation. The steam plants of that company delivered a net output of 15,342,445 kilowatt hours.

The hydro-electric plants of Wisconsin Michigan Power Company generated 210,977,404 kilowatt hours net, and the

3250 Iron River diesel engine plant produced a net output of 34,595 kilowatt hours.

Q. On the combined generating systems, which plant carries the base load? A. The base load of the combined three company system is carried by the Port Washington plant of Wisconsin Electric Power Company.

This plant is the most efficient steam plant serving the combined system, and, because of that fact, is assigned the duty of carrying the base or continuous portion of the loads
3251 on the system.

The Port Washington plant, as I have previously explained, is rated at 80,000 kilowatts, but it operates most efficiently at a load of 64,000 kilowatts.

—1,511—

For that reason it is operated steadily, whenever the loads on the systems will permit, at a demand of very close to 64,000 kilowatts.

Q. In the operation of this combined generating system what is the function of the Commerce Street and East Wells Street plant of the Wisconsin Electric Power Company? A.
3252 The Commerce Street and East Wells Street plants carry a portion of the loads on the electrical system of the companies, which is determined very largely by the requirements for steam for the heating system.

Their output is relatively small—or, rather, it has been, in the past—and has been largely limited to those months of the year in which steam is required for distribution in the downtown heating system.

With the new units going into service, however—that is, the new boiler plant and generating unit at East Wells

Street, and a somewhat similar installation at Commerce Street—these stations will be used to carry increasing amounts of the electrical load in the future, inasmuch as they will be equipped to exhaust into condensers and will be able to generate electrical power beyond that which is limited by the requirements for heating steam.

The Port Washington plant carries the base load. The Commerce Street and East Wells Street plants carry electrical load according to the heating load.

—1,512— 3254

The Racine plant, as I have explained, is not in regular operation but is started periodically and operated under load to make sure it is in operating condition.

Now, after those plants have made their contribution to the power requirements of the system, the Lakeside plant is used to carry the rest of the system demands, speaking now of the system of Wisconsin Electric Power Company.

At the same time the small generation of the hydro-electric plants of Wisconsin Gas & Electric Company is delivered into the system.

Under this arrangement of operations it can be seen that 3255
the load carried by the Lakeside plant is the most variable part of the load on the entire system, and because of those variations the Lakeside plant suffers the loss of economy that always accompanies the picking up and dropping off of loads on steam-driven units.

The Lakeside plant, because of its greater capacity, and because of the large number of units installed there, is best able of all the plants of the Company to carry these fluctuating loads.

Units in the plant range in size from 20,000 to 60,000 kilowatts. The 7,700 kilowatt units are not used individually without using the 60,000 kilowatt units with them.

To the greatest possible extent the loads on the Lakeside plant are carried on the high pressure equipment, because

—1,513—

of its greater efficiency, and the low pressure units are utilized only when the load on the plant goes to a point beyond the capacity of the high pressure units.

3257 The total generation in the power plants of Wisconsin Electric Power Company in 1939, under this general program of operation, was divided as follows:

Lakeside plant, 840,813,115 kilowatt hours.
Port Washington plant, 391,411,055 kilowatt hours.
East Wells Street plant, 34,471,800 kilowatt hours.
Commerce Street plant, 9,831,053 kilowatt hours.
Racine plant, 751,675 kilowatt hours.

Making the total net generation, which I have previously
3258 given for Wisconsin Electric Power Company.

Q. I think you indicated sufficiently the fact that Wisconsin Gas & Electric Company does practically no generation of its own. Could you give the figures on net kilowatt hour output of whatever generating capacity is operated by that company? A. Yes, I can. The net output of the three hydro-electric plants of Wisconsin Gas & Electric Company in 1939 was 1,241,584 kilowatt hours.

In terms of the total energy requirements of 207,451,690 kilowatt hours, of the system of Wisconsin Gas & Electric

Company in that year, this generation constituted about six tenths of one per cent.

—1,514—

Q. Within the generating units of Wisconsin Michigan Power Company what principles are followed in distribution of the operating generating capacity? A. The principal rule that is followed by the operators of Wisconsin Michigan Power Company in connection with power generation and transmission is to make the power plants of that company serve the entire needs of the system as completely as possible and to obtain from those hydro-electric plants as much output as can possibly be obtained with the quantities of water that are available under existing conditions. 3260

The output of the hydro-electric plants of Wisconsin Michigan Power Company is supplemented by generation at the Appleton steam plant of that company and also by a very small amount of generation at the Iron River diesel plant.

Under the water conditions obtaining in 1939 and the load conditions on the system, the hydro-electric plants of that company generated a total net output of 210,977,404 kilowatt hours. 3261

The Appleton steam plant produced 15,342,445 kilowatt hours, and the Iron River internal combustion plant produced 34,595 kilowatt hours.

The plants in the northern portion of the Company's system are operated so as to make that section of the system as nearly self-supporting as possible, with respect to power supply.

—1,515—

Such operation eliminates unnecessary transmission of large quantities of power over the line from Appleton to the north, and consequently keeps transmission losses at a minimum.

During the seasons of high water, as I have pointed out, these plants produce more energy than the local market requires, and the surplus is sent south over the high voltage transmission line.

During seasons of low run-off the reverse is true—that
3263 is, the shortage of power in the northern division is made up by steam power sent north from Appleton, or by power generated at the two hydro-electric plants in the Appleton division.

Q. You have indicated a number of points at which interconnections exist between the transmission systems of Wisconsin Electric Power Company and the Wisconsin Gas & Electric Company.

In the actual operations of the two systems, are the transmission systems of the two companies closely coordinated and closely connected in operation? A. Yes, they are
3264 so closely connected and so closely coordinated as to operation that, in an operating sense, they are only one system.

I have pointed out at how many points the two systems are interconnected, and, in many instances, those interconnections are nothing more than a change in ownership of line.

—1,516—

Wisconsin Electric Power Company normally delivers to the system of Wisconsin Gas & Electric Company monthly quantities of energy ranging up to 16 or 17 million kilowatt hours.

These deliveries are made at 28 different locations and quantities of the energy, delivered to Wisconsin Gas & Electric Company through these 28 points of contact, are returned in part to the system of Wisconsin Electric Power Company at more than twenty different points.

Nine of the points at which delivery is made to Wisconsin Gas & Electric Company are also points at which energy is returned to the system of Wisconsin Electric Power Company from that of Wisconsin Gas & Electric Company.

Now, this flow and reflow of energy between the two systems is the sort of thing that one would find if he undertook to set out any portion of any one system and trace the flow of energy into and out of that section. 3266

The energy returned to the system of Wisconsin Electric Power Company from that of Wisconsin Gas & Electric Company consists of a part of the same energy which was previously delivered to the system of Wisconsin Gas & Electric Company at some other point,—that is, at any one instant, when energy is flowing back into the system of Wisconsin Electric Power Company, it is also flowing into the system of

 3267

Wisconsin Gas & Electric Company somewhere else.

Except for the small generation in the hydro-electric plants at Watertown and West Bend, the energy furnished by Wisconsin Electric Power Company is the only energy that Wisconsin Gas & Electric Company has, so, in billing Wisconsin Gas & Electric Company for the energy delivered to it, Wisconsin Electric Power Company summarizes the deliveries at those 28 different locations, and the number of those points changes from time to time as the systems are

3268 *Edward H. Schmidtman—By Respondents—Direct*

extended and changed, and also summarizes the energy returned at those twenty-odd different locations, determines the net amount delivered to Wisconsin Gas & Electric Company, and bills that amount.

Now, the interchange of energy back and forth between these two systems suggests that not only are the facilities of Wisconsin Electric Power Company used in taking energy to Wisconsin Gas & Electric Company, but likewise that the facilities of Wisconsin Gas & Electric Company are used
3269 in carrying that energy to some other point and returning it to Wisconsin Electric Power Company.

I have made a rather—well, shall we say—offhand inspection of the transmission lines of the two companies and have determined a number of sections of line of Wisconsin Gas & Electric Company which are used at some time or other in carrying energy from the system of Wisconsin Electric Power Company and back to it.

—1,518—

To that extent, Wisconsin Electric Power Company is
3270 actually utilizing the facilities of Wisconsin Gas & Electric Company in serving its own load.

Q. Transmission facilities? A. Transmission facilities, yes.

Q. Can you illustrate that—— A. (Interposing) Yes, I can.

Q. (Continuing) ——interflow of energy? A. Yes. According to the monthly billings which are made to Wisconsin Gas & Electric Company, it is a very common thing for that Company to deliver back to Wisconsin Electric Power Com-

pany certain quantities of electrical energy at the Burlington sub-station, which appears on Exhibit 32.

The energy which is delivered to Wisconsin Electric Power Company at that point must come from either Kenosha or Whitewater, because Wisconsin Gas & Electric Company has no other power sources serving the Burlington sub-station.

That means that the line of Wisconsin Gas & Electric Company between Kenosha and Burlington, and the line between Whitewater and Burlington, are both at some time or other being used in transmitting energy of Wisconsin Electric Power Company to the Burlington sub-station. 3272

The Examiner: Well, it could conceivably come, in case you need it, from your interconnection to the

—1,519—

south there—from the Wisconsin Power & Light Company—could it not?

The Witness: No, sir. It couldn't. Because the interconnections there—— You refer to the ones in Walworth County? 3273

The Examiner: That is right.

The Witness: Those interconnections are points at which delivery only is made.

Wisconsin Power & Light Company has no power source in what they call their Lake Geneva division in this district in Walworth County, and they rely largely upon the system of Wisconsin Gas & Electric Company to furnish the power for that section.

3274 *Colloquy*

The Examiner: I see. It is an outgoing interconnection—not an incoming?

The Witness: That is right.

The Examiner: So far as your system is concerned?

The Witness: That is correct. That is entirely the case.

Now, your question indicates to me that I haven't made entirely clear just how it happens that this energy flows back into the system of Wisconsin Elec-
3275 tric Power Company. It isn't because Wisconsin Electric Power Company needs the energy, as your comment indicates might have been the case, but it simply comes about as a result of voltage conditions

—1,520—

on the systems.

You might consider, for purposes of analogy, that the system pictured on the map is built up of pipe lines carrying water, and that water is pumped into it at the points where the power plants are located, and that there are outlets at the sub-stations—
3276 faucets, through which it may be drawn off.

Now, if there is a higher pressure in the line at Whitewater than there is at Burlington, water will flow from Whitewater to Burlington to relieve that inequality of pressure.

The same thing applies with respect to voltage on the lines. If there should be a load in the vicinity of the Burlington sub-station, which lowers the voltage at that point sufficiently, energy will flow to that point from some other source of energy where the voltage is higher.

3277

The Examiner: And similarly, suppose that there should be some cause, or, for some cause or other, some substantial outage at one of your generating plants of Wisconsin Electric Power Company, would energy immediately start to flowing south from the Wisconsin Michigan generating plants?

A. It might and it might not. Under ordinary circumstances power does not flow south into the system of Wisconsin Electric Power Company from that of Wisconsin Michigan Power Company.

3278

The Examiner: Is it connected up so it could, in case of any emergency that required extra energy?

—1,521—

The Witness: Yes, it is connected up so that it could, but what I was going to say was that the power sources on the system of Wisconsin Electric Power Company are so much greater than those on the system of Wisconsin Michigan Power Company that we consider the interconnection between the two with respect to emergency service as being more for their benefit than for ours.

3279

The Examiner: Flow the other way——

The Witness: (Interposing) Yes.

The Examiner: (Continuing)—as a practical proposition?

The Witness: Yes, that is right. But the interconnection through between the companies is a complete and continuous one.

The Examiner: Excuse me, Mr. Hamilton.

3280 *Edward H. Schmidtman—By Respondents—Direct*

By Mr. Hamilton:

Q. Can you illustrate the extent of that flow and reversal of current by reference to data of a specific recent month? A. Yes, I can. I don't have with me the latest billing that has been made between the two companies, but I do have the one for the month of May 1940, which may be considered a representative month.

In that mohth, Wisconsin Electric Power Company delivered to Wisconsin Gas & Electric Company a total of

3281 —1,522—

17,156,399 kilowatt hours of electrical energy.

Wisconsin Gas & Electric Company returned to the system of Wisconsin Electric Power Company 751,105 kilowatt hours of that energy.

Q. And the billing, as a result of those transactions would be a net billing? A. Yes, a net billing for 16,405,294 kilowatt hours.

Q. Less the amount of current returned? A. That is the net figure.

3282 Q. I see. You have already made the subtraction? A. Yes. Likewise the billing covers demands imposed upon the system of Wisconsin Electric Power Company and recognizes the demands represented by the energy delivered back to that system, so that the billing to Wisconsin Gas & Electric Company covers net demands as well as net energy.

There are a number of other points—or, rather, sections—on the system of Wisconsin Gas & Electric Company, which transmit energy and return it to the system of Wisconsin Electric Power Company.

 3283

To run over them rather briefly, energy returned to Wisconsin Electric Power Company at Cedar Grove substation is delivered to Wisconsin Gas & Electric Company at Port Washington.

Energy received from Wisconsin Gas & Electric Company —1,523— at Brown Deer is delivered to Wisconsin Gas & Electric Company at the point where that company's line enters the territory of Wisconsin Electric Power Company.

Likewise, energy received from Wisconsin Gas & Electric 3284
Company at the latter point is delivered to that company at Brown Deer.

The flow occurs on that line in both directions. The net result in any one month, of course, being in only one direction.

Energy is received from the system of Wisconsin Gas & Electric Company at North Lake, which is located in the northwesterly part of Waukesha County.

In the vicinity of North Lake it is also received from the system of Wisconsin Gas & Electric Company at two points not designated on the map, where two sand and gravel com- 3285
panies take service.

The energy received at those three points from Wisconsin Gas & Electric Company is delivered to that company over at the Granville substation, and the Wisconsin Gas & Electric Company line from Granville over to the vicinity of Merton, where the line changes ownership, is utilized in serving the customers of Wisconsin Electric Power Company in the vicinity of North Lake substation.

Energy is received from Wisconsin Gas & Electric Company at the Belgium substation located near the shore of

3286 *Edward H. Schmidtman—By Respondents—Direct*

Lake Michigan, north of Port Washington, and also at an-

—1,524—

other railway sub-station south of Belgium, which takes service from the same line of Wisconsin Gas & Electric Company.

That energy is delivered to Wisconsin Gas & Electric Company at Port Washington.

Energy which is delivered to Wisconsin Gas & Electric Company at Kenosha is sometimes returned in part at Racine, utilizing the line lying between those cities.

3287 Likewise, power delivered to Wisconsin Gas & Electric Company at the Whitewater substation is returned in part to Wisconsin Electric Power Company up at Watertown on the other side of Jefferson County.

That delivery of energy takes place over one or both of the circuits of Wisconsin Gas & Electric Company, connecting Whitewater and Watertown.

In addition to these sections of line which I have described there are nine points on the distribution system of Wisconsin Gas & Electric Company where customers of Wisconsin Electric Power Company receive service. They

3288 receive that service directly from the lines of Wisconsin Gas & Electric Company, but, inasmuch as they lie within the territory of Wisconsin Electric Power Company, they are considered as customers of the latter company, and the energy delivered to them is a return of energy previously delivered to Wisconsin Gas & Electric Company.

—1,525—

Q. And will you state those points? A. I beg your pardon?

(Last question read by the reporter.)

3289

The Examiner: Can you state those points?

The Witness: The designations I will give refer to certain roads and townships not named on Exhibit No. 32. One of them is at the Mill Road in Milwaukee County; one is in the township of Milwaukee, one is in the township of Merton; one in the township of Brookfield; one in the township of Pewaukee; one in the township of Troy in Walworth County; one in the township of Merton; one in the township of Oconomowoc; and one is located at the switching station of Wisconsin Electric Power Company at Saukville east of Port Washington.

3290

These points are fairly well scattered over the vicinity through which the boundary line between the territories of the two companies pass.

By Mr. Hamilton:

Q. Can you state the demand which the requirements of Wisconsin Gas & Electric Company place upon the generating capacity of Wisconsin Electric Power Company? A. The demands placed upon the system of Wisconsin Electric Power Company, in serving the power needs of Wisconsin Gas & Electric Company, vary from month to month, but in the month of May 1940, for which I have here the billing

3291

—1,526—

data, the gross demand delivered by Wisconsin Electric Power Company was 44,664 kilowatts.

The demand represented by energy returned to the system of Wisconsin Electric Power Company amount to 684 kilowatts, leaving a net billed demand of 43,970 kilowatts.

3292 *Edward H. Schmidtman—By Respondents—Direct*

I would like to add at this point that the interflow of energy between the systems of these two companies occurs as a result of load variations on different parts of the combined system.

The flow is not restricted. No attempt is made to control it at any one or any other point, and no distinction is made between the requirements of Wisconsin Gas & Electric Company and the requirements of Wisconsin Electric Power Company in deciding how to operate the transmission sys-
3293 tem. The customers of one company are regarded as being just as important as the customers of the other company.

What I am trying to bring out is that we make no distinction as to whether generation is going to the system of Wisconsin Gas & Electric Company or whether it is going to the system of Wisconsin Electric Power Company. The two, in fact, are one system.

Q. And, necessarily, any load forecasting is based on taking into account the requirements of Wisconsin Gas & Electric Company? A. Yes. Any load forecasting that is made, any analyses relating to available capacity or capac-
3294 —1,527—
ity requirements, or quantities of energy estimated for budget purposes, or any other purposes, includes the requirements of the customers of Wisconsin Gas & Electric Company on an equal basis with that of the customers of Wisconsin Electric Power Company.

Further than that, load forecasting is usually carried out on a composite system basis, also taking into consideration the power generation facilities and power requirements of the system of Wisconsin Michigan Power Company.

3295

The power production and transmission systems of these companies are considered as a unit with respect to power production and power transmission.

We regard this as just one power pool into which all companies contribute their generation and from which they all draw their requirements.

It is still true, however, as I stated before, that good operation requires that certain sections of the system serve themselves as fully as they can, but, so far as the operations of one section of the system or one company's property may affect another section of the system or another company's property, the operations and welfare of the combined group is what controls.

3296

The Examiner: I think we made it clear that there is no incoming energy to your system on the south. Now, how about on the north here, where Cliffs

—1,528—

Power & Light Company interconnects? Is there incoming energy at those connections.

3297

The Witness: Yes, sir. There is. At the point east of Manistique, Michigan, the line shown on Exhibit 32 extending from Cooks over to the interconnection with Cliffs Power & Light Company, energy is received from that company. All of the energy distributed on that line, and on a lower voltage line extending from Cooks south, is purchased from Cliffs Power & Light Company.

Wisconsin Michigan Power Company has no generating facilities on that section of line.

The Examiner: I recall you stated that in a previous part of your examination.

The Witness: Yes, sir. I did.

The Examiner: It is disconnected from your system?

The Witness: Yes, sir. And the same is true of the isolated line in Marquette County, terminating on the west at Michigamme.

The Examiner: Well, with those two exceptions,
3299 the three companies develop all of the energy that they distribute?

Mr. Hamilton: I think the witness has indicated one or two other points where, in Wisconsin Michigan territory, for example, I believe there are purchases from Kimberley-Clark at certain times.

—1,529—

The Examiner: That is true.

By Mr. Hamilton:

Q. In order to make your point clear, Mr. Schmidtman,
3300 may I ask you about the point of interconnection in Rock County? I don't know that you specifically mentioned that —interconnection at that point with the system of Wisconsin Power & Light Company. Which is the direction of the flow of that energy? A. Energy flows in both directions through that interconnection. The interconnection was established for the purpose of providing 25,000 kilowatts of emergency service to either of the companies.

Since the establishment of this interconnection, emergency service has been taken by Wisconsin Power & Light Company

3301

on different occasions but has not as yet been taken by Wisconsin Electric Power Company.

However, the interconnection also permits the delivery into the system of Wisconsin Electric Power Company of limited quantities of surplus hydro-electric energy from the system of Wisconsin Power & Light Company.

Such energy is generated in the hydro-electric plants of Wisconsin Power & Light Company on the Wisconsin Power river, the Kilbourn and Prairie du Sac plants being the principal hydro-electric plants operated by Wisconsin Power & Light Company.

3302

—1,530—

Some of the surplus hydro-electric energy of Wisconsin Power & Light Company is delivered into the system of Wisconsin Electric Power Company over that connection, and I should add also, in order to make the statement complete, that in every interconnection of this kind, due to fluctuations in voltage at the two ends of the interconnection, such as those that cause the interflow of power between the systems of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company, there is a class of energy called drift energy, which drifts back and forth from one system to the other, in either direction, fluctuating at times, depending on voltage conditions at opposite ends of the line.

3303

That power is measured and is billed at a rate which recognizes its incidental occurrence and undependable character.

There is still another type of energy that flows through an interconnection of that kind—that is, where the switches are always closed and there are two operating systems, one at each end—that is called stabilizing energy. That is the

energy that is required to flow in a line to keep the wires charged.

In electrical terms, a high voltage transmission line serves in one respect somewhat like a large condenser, and, even though it may be delivering no energy for power purposes,

—1,531—

it will still draw some current from the supply end.

That current has to be supplied in order to keep the line charged and to keep it in stable condition as one of the
3305 branches of the electric operating system.

That energy is called stabilizing energy, but it does not do any good to either company except to keep the line in operation.

Mr. Hamilton: Mr. Examiner, we have reached a good stopping place.

The Examiner: We will recess, now, until ten o'clock tomorrow morning.

(Whereupon at 4:30 p.m., the hearing was recessed until 10:00 a.m. the following morning.)

3306

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

Hearing Room 1102,
Securities and Exchange Commission Building,
Washington, D. C.,
Thursday, September 12, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

CHARLES S. HAMILTON, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, Attorney for the Securities and Exchange Commission.

MISS E. H. CALKINS, Attorney for the Securities and Exchange Commission.

3310 *Edward H. Schmidtman—By Respondents—Direct*

PROCEEDINGS

The Examiner: The hearing will come to order.

EDWARD H. SCHMIDTMAN resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. At the close of the hearing yesterday afternoon, Mr. Schmidtman, you were testifying as to the sale of power by
3311 Wisconsin Electric Power Company to Wisconsin Gas & Electric Company. Have you any statistics as to the extent of that sale over a period of years? A. Yes, I have. During the last ten years—that is, from the year 1930 to 1939 inclusive, Wisconsin Gas & Electric Company has purchased not less than 96½ per cent of its total power requirements from Wisconsin Electric Power Company each year.

In the year 1936, Wisconsin Gas & Electric Company purchased 99.6 per cent. of its total power requirements from Wisconsin Electric Power Company. Since 1934, Wisconsin Gas & Electric Company has purchased no energy from any
3312 system other than Wisconsin Electric Power Company, but during the years prior to that, it purchased up to a maximum of 2.3 per cent. of its annual energy requirements from Wisconsin Power & Light Company.

During the ten-year period just mentioned, the annual

generation in the plants of Wisconsin Gas & Electric Company furnished not more than 1.3 per cent. of the total energy input to the system of Wisconsin Gas & Electric Company.

Q. In any given year? A. In any given year.

Q. Now, in order to make those figures precise, could you give the percentages for the years 1936 and subsequent? A. In the year 1936, Wisconsin Gas & Electric Company generated .4 of 1 per cent. of its requirements and purchased 99.6 per cent. from Wisconsin Electric Power Company.

In 1937, the generation amounted to .6 of 1 per cent. and the purchases to 99.4 per cent. of requirements.

In 1938, generation was 1 per cent. and purchases 99 per cent.

In 1939, as I have testified previously, generation was 3314
.6 of 1 per cent. and purchases from Wisconsin Electric Power Company 99.4 per cent.

Q. Is the purchase of this power from Wisconsin Electric Power Company advantageous to Wisconsin Gas & Electric Company? A. Yes, it is; most advantageous. By being able to obtain its power from Wisconsin Electric Power Company, Wisconsin Gas & Electric Company enjoys the advantages of the high economy and low investment in the large generating stations of Wisconsin Electric Power Company.

It also receives the benefits of the use of the high voltage 3315
transmission system of Wisconsin Electric Power Company which system is used in carrying energy from the power generating stations to the points of delivery on the system of Wisconsin Gas & Electric Company.

The use of this transmission system makes possible the efficient delivery of the large blocks of power which Wisconsin Gas & Electric Company receives at its major points of contact with the system of Wisconsin Electric Power Company. If this source of power were not available to Wiscon-

sin Gas & Electric Company, that company would have to put in one or more power plants of its own to furnish its power needs.

I testified yesterday that the net demand represented by sales to Wisconsin Gas & Electric Company amounted to a net figure of 43,970 kilowatts in May of 1940.

In other months, it is higher than that and in still other months it runs below that somewhat, but in order to carry loads of this magnitude in power plants of its own, Wisconsin Gas & Electric Company would have to have stations with an aggregate capacity of not less than 60,000 kilowatts, I should say.

3317

Steam generating capacity of that magnitude would cost in the neighborhood of $6,000,000.00 or more, assuming a unit cost of $100.00 per kilowatt for the smaller plants, and the transmission system that would be required in carry-

—1,536—

ing the energy from such plant or plants to the present transmission facilities of the company would represent additional substantial investment.

3318 Q. Your figure of 60,000 kilowatts is based on the fact that reserve capacity would be necessary in the operation of its own system? A. Yes, it is.

Any electric utility system would be required, in order to assure reasonable continuity of service, to have reserve generating capacity somewhat in excess of its maximum load on the system.

Wisconsin Gas & Electric Company, in receiving power service from Wisconsin Electric Power Company, is able to have such service continuity guaranteed by virtue of the

3319

reserve capacity carried in the generating plants of Wisconsin Electric Power Company.

The power is sold to Wisconsin Gas & Electric Company at a rate which covers costs of power production and fixed charges and operating expenses on all facilities used in rendering the service.

This service is rendered under a special rate which is filed with the Public Service Commission of Wisconsin and which is available to any public utility which would take equivalent or greater quantities of energy and would have 3320
equivalent or greater demands on the system of Wisconsin

Electric Power Company.

That is, the rate is not limited to Wisconsin Gas & Electric Company but rather is available to any electric utility system which could qualify as to magnitude of loads. This rate includes a demand charge schedule which specifies $18.00 per kilowatt per year for the first 20,000 kilowatts of demand and $15.00 per kilowatt per year for all demands in excess of 20,000 kilowatts.

3321

The energy steps of the rate begin with seven-tenths of a cent per kilowatt hour for the first 1,000,000 kilowatt hours taken within a month. The next 6,000,000 kilowatt hours per month are billed at sixty-five-hundredths of a cent; the next 8,000,000 kilowatt hours per month are billed at six-tenths of a cent per kilowatt hour, and all consumption in excess of 15,000,000 kilowatt hours per month is billed at fifty-five-hundredths of a cent per kilowatt hour.

In 1938, the average cost of this service to Wisconsin Gas & Electric Company amounted to eighty-eight-hundredths

of a cent per kilowatt hour including both energy charge and demand charge.

Q. These billings you have spoken of are net billings, are they? A. Yes, they are net billings.

Q. And, therefore, do not include energy delivered Wisconsin Gas and returned by Wisconsin Gas to its system?

—1,538—

A. That is right. They cover the net energy delivered to Wisconsin Gas & Electric Company for resale to its cus-
3323 tomers. The power service which is rendered Wisconsin Gas & Electric Company by Wisconsin Electric Power Company for use in the gas plant and other operations of Wisconsin Gas & Electric Company is billed at regular filed rates for the classes of service under which the service is rendered.

That energy is not included in the billings under what we call the general power contract, the rates of which I have just given, which is intended to apply only to the power sold to Wisconsin Gas & Electric Company for resale to its customers.

Q. Is the amount of energy which Wisconsin Gas &
3324 Electric Company may take under this filed rate restricted in any way by contract or otherwise? A. No, there is no restriction whatever on the amount of energy or the magnitude of demand which Wisconsin Gas & Electric Company may take from the system of Wisconsin Electric Power Company.

If Wisconsin Gas & Electric Company should experience a marked increase in power requirements, Wisconsin Electric Power Company would stand ready to install such additional power generation and transmission facilities as would be required in serving that increased load.

3325

The contract specifies no limits and the spirit of the

—1,539—

arrangement contemplates no limits on the extent of the service which Wisconsin Gas & Electric Company may take from Wisconsin Electric Power Company.

Q. Is there any characteristic of the territory of Wisconsin Gas & Electric Company which makes that territory particularly adapted to this source of power supply? A. Yes, there is, and that characteristic is its geographical shape and position with respect to the territory and system of Wisconsin Electric Power Company.

3326

Reference to Exhibit 32 will show that the territory of Wisconsin Gas & Electric Company lies generally in the form of an irregular ring or rim around the south, west and north sides of the territory served by Wisconsin Electric Power Company.

This relationship of territories makes it most economical for both territories to be served by a system generally radiating from power sources somewhere near the center of the right-hand edge lying along Lake Michigan.

3327

If Wisconsin Gas & Electric Company were deprived of its present power source, namely, the system of Wisconsin Electric Power Company, it would be faced with a problem of locating power plants capable of serving this ring of territory, and it is quite probable that the company would find it necessary to install at least two plants because one plant located in any portion of the territory would have to deliver

—1,540—

energy substantial distances in order to serve the entire electric service territory of the company.

Q. Thereby losing the advantages of operations of large units? A. Yes, entirely so. The relationship of these territories makes it most advantageous for both systems—or rather, the combined systems—to be served from one system of power generation facilities.

Q. You have testified as to the interchange between Wisconsin Electric Power Company and Wisconsin Michigan Power Company. Is this interchange of this interconnection of benefit and advantage to Wisconsin Michigan Power Com-
3329 pany? A. Yes, it is. I have explained that Wisconsin Michigan Power Company finds itself, during flood seasons, in possession of potential electrical energy in excess of its own system requirements and that in seasons of low flow it is in need of additional stand-by energy.

This interconnection fills both of those needs and I may say that this interconnection is the only means available by which those needs could be filled for Wisconsin Michigan Power Company.

Q. Now, will you explain that point? A. Other electric utility systems with which Wisconsin Michigan Power Com-
3330 pany now has or could establish interconnections intended to perform the functions of the present interconnection with

—1,541—

Wisconsin Electric Power Company, are located in territory similar to that in which Wisconsin Michigan Power Company operates.

These other systems also have considerable hydro-electric generating capacity and they also have, during the flood seasons of the year, surplus quantities of hydro-electric energy which they would like to sell.

3331

Since they have a surplus at the time Wiscor 1 Michigan Power Company has a surplus, obviously they could furnish no outlet for the surplus power of Wisconsin Michigan Power Company.

Likewise, in seasons of low flow, these neighboring companies are in need of all their own steam generating capacity to bolster up their deficient supply of hydro-electric capacity and at those times of the year they are not in a position to furnish Wisconsin Michigan Power Company any help that it might need.

3332

The presence of a large market in the Milwaukee district and surrounding areas, and the magnitude of the loads served in that territory makes it possible for Wisconsin Electric Power Company to absorb that surplus hydro-electric energy and to furnish the needed steam power during seasons of drought.

I have mentioned that Wisconsin Michigan Power Company has interconnections with certain customers who operate hydro-electric plants of their own. These hydro-

—1,542—

3333

electric plants of the customers experience the same periods of surplus and shortage as are experienced by the hydro-electric plants in this part of the state in general.

In furnishing stand-by service to these customers and in taking off their hands the surplus hydro-electric energy which they have, Wisconsin Michigan Power Company is rendering them the same type of service which it is receiving from Wisconsin Electric Power Company and it can render that service to them on the terms at which it is doing it only because of the fact that it has an outlet for the surplus hydro-

3334 *Edward H. Schmidtman—By Respondents—Direct*

electric energy it receives from those customers and has a source of stand-by steam energy which it furnishes to them.

Now, when I refer to a source of stand-by steam energy I am not unmindful of the fact that Wisconsin Michigan Power Company does own and operate a 20,000 kilowatt steam generating station at Appleton. This steam generating station is operated to carry full load at certain times of the year but, as I will explain subsequently, operations at that plant are minimized to those times when it is actually needed
3335 and can not be supplanted by steam power from the south for economy reasons.

Q. Would you say, then, that the existence of the interconnection prevents the waste of surplus hydro-electric

—1,543—

energy? A. Yes, definitely, it does, and in preventing that waste it conserves coal that would otherwise be burned in the plant of the Wisconsin Electric Power Company in carrying the loads which it is able to carry by dovetailing the surplus hydro-electric energy into its own power supply.

Q. Is the interchange between the two companies of bene-
3336 fit to Wisconsin Electric Power Company? A. Yes, it is. Wisconsin Electric Power Company, of course, is called upon to regulate the operation of its own power plants in order to absorb the surplus hydro-electric energy received from Appleton.

In doing that, the loads on the steam generating stations must be reduced. Usually such reduction of load results in some loss of economy because it may require the placing of uneconomical loads on certain steam generating units.

The rate which is paid for the surplus hydro-electric

energy recognizes the fact that some loss of economy results from the use of that energy.

That is, the remaining loads on the steam plants are generated at slightly higher heat consumption than was the case before the hydro-electric energy was introduced into the system.

For that reason, the rate which is paid for the surplus

—1,544—

hydro-electric energy is something less than the actual cost of coal consumed in generating power in the steam plants of 3338 Wisconsin Electric Power Company.

This interchange of power between the two systems is carefully coordinated through the operations of the load dispatchers of the two companies, and by such coordination the loss of economy in the steam plants of Wisconsin Electric Power Company is minimized, while, at the same time the greatest possible use is made of the available energy from the hydro-electric plants.

Q. Are there other advantages to Wisconsin Michigan Power Company which you haven't mentioned? A. Yes, there is a very real advantage which accrues to Wisconsin Mich- 3339 igan Power Company through this type of operation, which results from the manner in which the load is interchanged during periods of low flow.

I have explained that during such periods, the water power plants are incapable of delivering enough power to carry the loads on the system of Wisconsin Michigan Power Company as a whole and that steam power is sent up to Appleton to supplement that inadequate supply.

So far, we have spoken simply in terms of kilowatt hours, but the schedule by which those deliveries are made results

3340 *Edward H. Schmidtman—By Respondents—Direct*

in substantial advantage to Wisconsin Michigan Power Company.

—1,545—

I pointed out yesterday that Wisconsin Michigan Power Company serves a number of paper mills and other industries in the Appleton area which generate a part of their own power requirements by means of water wheels operating from water in the Fox River.

When the flow in the Fox River drops to low levels,
3341 these mills are unable to operate their water-driven equipment because of insufficient water in the stream. They then call upon Wisconsin Michigan Power Company to make up that shortage in power, thus imposing on the system of the company a greater load than they impose upon it at any other time of the year.

Now, this increased load comes at a time when the hydro-electric plants of the company are usually at their lowest output levels. So here we have a combination of what frequently turns out to be the maximum annual demand on the system of the company occurring in the middle of the
3342 summer when the hydro-electric plants are least able to carry the load.

This situation is handled by scheduling operations in such a way that the hydro-electric plants in Michigan shut down at night to such extent as they can do so and still discharge necessary quantities of water in the streams.

Some of them, as I have pointed out, are not able to accomplish any considerable degree of manipulation of stream flow because of requirements of riparian owners downstream and also because of conservation requirements.

—1,546—

 3343

The plants which are able to operate on this peaking cycle store water at night and use that water during the day time in carrying the day time peaks in the northern division and at the same time sending such portions of their power as are in excess of northern division requirements south over the line to Appleton.

In periods of extreme shortage of water, energy is not sent south to Appleton in any considerable quantities, but the water is retained for use in that division so that it will be unnecessary during periods of ponding water to send 3344 energy north over the line.

The transfer back and forth over the line of large quantities of energy is minimized in order to reduce transmission losses.

Now, then, at night, when the plants in the northern division are operating at reduced loads and are impounding water, the loads on the southern division are carried by means of what we call "dump steam energy" delivered from the plants of Wisconsin Electric Power Company over the Milwaukee-Appleton transmission line.

3345

This dump steam energy, as a result of this cycle of operations, is delivered at night when the loads on the system of Wisconsin Electric Power Company are at their lowest, and, consequently, at a time when it is considerably advantageous to build up those loads in order to maintain

efficient operating conditions in the steam plants.

Because of the character of this dump steam energy, with respect to time of day and with respect to its effect upon the loads of Wisconsin Electric Power Company steam

plants, it is sold to Wisconsin Michigan Power Company at a rate which recognizes the character of the energy.

The rate which is charged for dump steam energy is one-third of a cent per kilowatt hour and is based on increment costs of generating such power in the steam plants of Wisconsin Electric Power Company.

The availability of this dump steam energy to Wisconsin Michigan Power Company enables that company to utilize more economically the kilowatt hours represented in the
3347 water flowing in the streams at its hydro-electric plants in the northern division, and to also minimize the flow of energy over the transmission lines of the northern division.

The rate of one-third cent per kilowatt hour at which dump steam energy is delivered to Wisconsin Michigan Power Company at Appleton is appreciably below the production cost of generating energy in the Appleton steam plant and enables Wisconsin Michigan Power Company to obtain energy of that kind at a cost less than it would experience if it generated it in its own plant.

At the same time, as I have pointed out, it improves
3348 —1,548—
operating conditions at the plants of Wisconsin Electric Power Company permitting the realization of higher economy in those plants as well.

Q. While we are on the general subject of the method in which the operations of these hydro-electric plants are synchronized, would you explain the studies that were made on the movement of waves in water-flow in the territories of the northern section of Wisconsin Michigan Power Company? A. Yes, I will.

Q. And relate the significance of those studies to the actual operations of the hydro-electric system? A. Yes.

The type of operation which I have described, involving the ponding of water at one time of day and the release of it through water turbines at another time of day, obviously causes fluctuations in the quantities of water discharged by the streams below the plants.

While water is being ponded, the flow in the stream below is reduced to the amount of water which is being permitted to pass the plant and progressively downstream it is 3350
increased by the contributions of the tributaries which flow into the river.

When the plants are put into operation, the discharge is increased by the amount of water released through the turbines.

—1,549—

The discharge during periods of ponding is less than what would normally be the flow of the stream at that time and the discharge during the periods of operation is more than that normal flow at that time. 3351

These fluctuations in discharge result in the formation of flow-waves in the stream. When the turbines are put into operation, the flow in the stream is sometimes nearly double what it was immediately before the wheels began carrying load.

That increased quantity of water moves downstream in the form of a wave which is definitely measurable as to magnitude, rate of travel, and the period of time which it takes that wave to disappear within a given stream bed.

3352 On the Menominee River, a number of hydro-electric plants are located, several in addition to those operated by Wisconsin Michigan Power Company. Many of these plants have relatively small reservoirs above the dams and are unable to absorb without loss of water such waves as those I have just described.

This makes it necessary in carrying on these operations to give consideration to the owners of plants located on the streams below the plants at which the peaking operations are
3353 desired to be carried out.

I explained that the waves from the Brule River plant are discharged into the pond of the Twin Falls Plant. The

—1,550—

Twin Falls Plant has a relatively large pond above the dam and its upper levels are of sufficient capacity to absorb the short duration waves resulting from the peaking operations at the Brule River Plant.

Likewise, the peaking operations at the Pine River Plant discharge flow waves into the Pine River which are still appreciable at the mouth of the stream where it flows into
3354 the Menominee River.

Immediately below that point is located the hydro-electric plant of the Ford Motor Company and in order to not cause the quantities of water delivered to the Ford plant to result in a spilling of water at that point and the wasting of the energy represented by that water, the Twin Falls plant is operated so that the trough created by the partial shutting down of the Twin Falls Plant will reach the pond of the Ford plant at the same time that the surge from the Pine River Plant reaches it.

3355

By carefully gauging those quantities of water—that is, the magnitude of the water withheld at Twin Falls and the quantity of water discharged at the Pine River Plant—the effect on the pond above the Ford dam is imperceptible and no waste of water results from that type of operation.

It has been discovered that discharges from the Pine River Plant take six hours in flowing down the river to reach the Menominee, but that discharges from the Twin Falls Plant

—1,551—

which is located immediately at the upper reaches of the 3356
Ford pond, will affect the level of the Ford pond immediately.

For this reason, the operations of the Twin Falls Plant and the Pine River Plant are scheduled so that when the wave from the Pine River Plant has been traveling six hours, the turbines at the Twin Falls Plant will be shut down in proportion to the quantity of water released at the Pine River Plant six hours earlier.

Likewise, when the Pine River Plant is taken off the peak and is put back into a pounding period, the Twin Falls Plant operators stand ready to begin discharging water at Twin Falls six hours later. 3357

This consideration of flow-waves naturally enters into the operation of all of the plants which have ponding capacity sufficient to permit peaking operations. Such operations are carried on at the Chalk Hill Plant.

Here, again, Wisconsin Michigan Power Company has another hydro-electric station—the White Rapids Plant—immediately downstream, with a pond of sufficient capacity to equalize the irregularities of flow resulting from the peaking operations at the Chalk Hill Plant.

3358 The White Rapids pond does not have as great a ponding capacity as the Chalk Hill pond has but it doesn't need as large a capacity because, when the Chalk Hill plant is operated on, say, an eight-hour-a-day peaking cycle, so that it

—1,552—

discharges in eight hours the entire flow of the stream at that point, which is received in twenty-four hours, the White Rapids Plant, by operating through the entire twenty-four hours, doesn't need a ponding capacity of more than two-
3359 thirds that of the Chalk Hill Pond because it is discharging during the same eight hours that it is receiving water from Chalk Hill and merely has to store the water which it is going to discharge in the remaining sixteen hours or two-thirds of the day.

Nature seems to have been very foresighted when the topography at these two sites was formed, because, although the White Rapids pond is smaller than the Chalk Hill pond, it is still large enough to accommodate the peaking operations to as great an extent as it has been considered desirable give proper recognition to the rights of others, and has put
3360 to carry them on the Chalk Hill.

Q. The matter of flow-waves has been subject to considerable study and investigation by the companies? A. Yes, it has. The companies have participated in the study of flow waves on other rivers in Wisconsin.

These studies have been made in conjunction with the representatives of other electric systems which operate hydro-electric plants on streams in different parts of the state.

Q. Have the results of the studies, as far as your own

—1,553—

companies are concerned, been the effecting of economies in operations of the hydro-electric system? A. The study of wave phenomena on the streams on which Wisconsin Michigan Power Company operates hydro-electric plants have served as a guide in scheduling the peaking and regulating operations I have just described.

The economies resulting from those operations are substantial and, while the study of the peak discharges has not increased the value of such operations it has made it possible for the company to carry them on in such a way as to 3362
the company on firm ground with respect to the use of these characteristics of its plants.

—1,554—

Q. Now, returning again to the interchange between Wisconsin Electric Power Company and Wisconsin Michigan Power Company, does that interchange of energy involve energy other than dump hydro energy? A. Yes, it does. The interchange arrangement between the two companies also provides for the furnishing of firm power to Wisconsin Michigan Power Company, and the furnishing of emergency power to that company. 3363

Firm power is described in the contract and is regarded by the operators of the companies to be power delivered during the daytime hours, during the normal peak season of Wisconsin Electric Power Company.

That power is called firm because it is taken from the system of Wisconsin Electric Power Company during such hours and such seasons as Wisconsin Electric Power Company is likely to have its own peak demands and, as a result, might be in need of the greatest amount of its own generating facilities.

3364 This is distinguished from dump power, which is delivered during the hours of the day when the demands on the facilities of Wisconsin Electric Power Company are low and when there is a margin of capacity which can be utilized in delivering such dump power, but firm power deliveries might coincide exactly, as to time of occurrence, with the peak demands of the loads on the systems of Wisconsin Electric Power Company and Wisconsin Gas & Electric Company.

—1,555—

3365 Firm power is delivered to Wisconsin Michigan Power Company upon its specific day-to-day and hour-by-hour request. That is, if firm power is delivered at a certain hour today and is discontinued, pursuant to dispatcher's orders, at another hour, similar deliveries will not be made tomorrow unless it is requested.

Under those conditions firm power is delivered to Wisconsin Michigan Power Company at a rate including a demand charge of $15.00 per kilowatt per year, and an energy charge of one-half cent per kilowatt hour, which is adjusted according to a coal factor, recognizing the changes in cost of
3366 coal at the steam plants of Wisconsin Electric Power Company.

The contract also provides for the furnishing of emergency power to Wisconsin Michigan Power Company. The amount of emergency power which Wisconsin Electric Power Company holds itself ready to deliver is limited only by the capacity of the interconnection facilities.

This capacity is not a definite figure but it is believed that up to possibly 25 or 30 thousand kilowatts of capacity could be delivered to Wisconsin Michigan Power Company over these facilities.

3367

The charge for emergency service is one cent per kilowatt hour, and the minimum charge requires that the company calling for emergency service must take such service for at least one hour at the maximum demand imposed.

—1,556—

If it does not take service equivalent to one hour's use of the maximum demand, it is required to pay for that amount of energy nevertheless.

Emergency service is also available to Wisconsin Electric Power Company from Wisconsin Michigan Power Company up to the limit of the latter company's ability to furnish it, and at the same rate.

3368

Q. What effect does the existence of this source of emergency power have on the requirements of Wisconsin Michigan Power Company for reserve capacity? A. It practically eliminates the need for reserve capacity on the system of Wisconsin Michigan Power Company, because of the availability of emergency service and the availability of the dump steam service.

Wisconsin Michigan Power Company is carrying loads which are approaching fairly close to the total load-carrying capacity of its power generating facilities. It can do that safely because of its position with respect to this interconnection which will furnish emergency service in case of the outage of any of its facilities.

3369

Q. Will you indicate the savings which are effected by both companies by reason of the interchange? A. During the year 1938, which was the year in which the present contract provisions for the interchange of dump hydro-electric power and dump steam power, emergency power and firm

—1,557—

power, was executed, Wisconsin Michigan Power Company delivered to Wisconsin Electric Power Company 57,703,000 kilowatt hours of surplus hydro-electric energy at Appleton.

Wisconsin Michigan Power Company, in the same year, purchased from Wisconsin Electric Power Company 16,467,500 kilowatt hours of dump steam energy.

Recognizing the cost which Wisconsin Michigan Power Company would have incurred in generating an equivalent amount of steam energy in the Appleton plant, it is estimated
3371 that that company saved $81,702.00 in the use of dump steam energy from Wisconsin Electric Power Company. I have given you the wrong figure there. That figure should be $21,184.00. The $81,702.00 is the amount by which the revenue received by Wisconsin Michigan Power Company for the dump hydraulic energy exceeded the estimated increment cost of generating that hydro-electric energy.

The sum of these two figures, which amounts to $102,886.00 therefore represents the estimated amount by which Wisconsin Michigan Power Company benefited in 1938
3372 through the generation and sale of its surplus hydro-electric energy and through the purchase of dump steam energy.

Now, as for Wisconsin Electric Power Company, it is estimated that the revenue received for the dump steam energy delivered to Wisconsin Michigan Power Company at Appleton exceeded the actual incremental cost of producing

that energy by $10,181.00.

The saving which Wisconsin Electric Power Company realized through the use of the surplus hydro-electric energy from Appleton is estimated at $27,535.00.

3373

That estimate recognizes the price actually paid for that surplus hydro-electric energy as well as the cost of generating such energy in the power plants of Wisconsin Electric Power Company, after making adjustment for the reduced economy resulting from the use of that surplus hydro-electric power.

The total estimate benefit to Wisconsin Electric Power Company amounts to the sum of these two figures, or $37,716.00.

The combined saving to both companies during that year amounts to $140,602.00, according to these estimates.

3374

Now, I mention these as estimates, because, when one attempts to calculate how much it would have cost to do something that wasn't done, no matter how carefully the calculation is made there are bound to be some elements of estimate involved.

These figures are derived from the operating records of the companies, including production economy, and are as close as we can come to a quantitative measure of the savings realized through this interchange operation.

Q. Before we leave this point, is the Appleton steam

3375

—1,559—

plant of Wisconsin Michigan Power Company as efficient as the Port Washington or Lakeside plants of Wisconsin Electric Power Company? A. No. It is not anywhere near as efficient as either the Lakeside or Port Washington plant.

The Appleton plant has four 5,000 kilowatt units, which are relatively small. They are older units and don't have as high operating efficiency as those at Lakeside or Port Washington.

Q. Isn't it a fact that three of those units were installed before Wisconsin Michigan Power Company became affiliated with Wisconsin Electric Power? A. Yes, that is true One of the present units was installed in 1920 and two of them in 1917, yes.

Q. So that the high standards of construction now prevalent in the system were not applied to the construction of those plants? A. No, they weren't. The present high standards of construction probably hadn't been conceived by
3377 that time, and the fact that the Appleton plant has a lower operating economy than that of the large stations of Wisconsin Electric Power Company is no reflection on the people who built the Appleton plant nor the people who are now operating it. It is just an older plant and isn't as efficient as the modern ones, and the interchange operation between the companies makes it possible to take advantage

—1,560—

of the higher efficiency of the large stations of Wisconsin Electric Power Company and make less extensive use of the less economical machines in the Appleton plant.

3378 Continuing with the answer to your question, Mr. Hamilton, I have covered the savings that were realized in 1938. In 1939, operations were continued on a similar basis with respect to the interchange, and Wisconsin Michigan Power Company delivered 49,256,500 kilowatt hours of dump hydro-electric energy to Wisconsin Electric Power Company at Appleton.

In the same year Wisconsin Electric Power Company delivered to Wisconsin Michigan Power Company 9,597,000 kilowatt hours of dump steam energy.

 3379

The estimated savings resulting from this interchange amounts to $85,579.00 for Wisconsin Michigan Power Company, and $43,796.00 for Wisconsin Electric Power Company, making a total of $129,375.00 for the two companies together.

The interchange which has taken place thus far in 1940 indicates that the savings in this year will run into the same order of magnitude as those realized in 1938 and 1939. We haven't made complete estimates on it. We are going to wait for that until the year is over. 3380

These savings, as may be seen, are quite substantial and show that the joint operation of the facilities of the two

companies is advantageous.

Q. You have spoken of the existence of a source of emergency power to Wisconsin Michigan Power Company arising out of the interconnection. Can you illustrate the importance to Wisconsin Michigan Power Company of the existence of that source? A. The importance of the emergency service to Wisconsin Michigan Power Company can best be illustrated, perhaps, by a specific example. 3381

On July 17, 1940, Wisconsin Michigan Power Company was delivering between 15,000 and 20,000 kilowatts of surplus hydro-electric energy to the 132,000-volt sub-station at the Twin Falls plant in Michigan.

At 10:40 in the evening of that day, a storm took the transmission line between Twin Falls and Appleton out of service, and that, of course, removed the source of power which was furnishing the surplus hydro-electric energy to Wisconsin Electric Power Company and which was also carrying substantial load in the Appleton territory. These

3382 loads, being deprived of their source from Twin Falls, were immediately and automatically shifted to the line between Appleton and Milwaukee, and the power plants of Wisconsin Electric Power Company immediately picked up the load. The flow of power in the Milwaukee-Appleton line was instantly reversed and energy began flowing into the system of

—1,562—

Wisconsin Michigan Power Company in the Appleton district, from the Milwaukee power plants.

3383 At 11:07, the line between Twin Falls and Appleton was restored to service and the flow of energy in the Appleton Milwaukee line was again reversed, resuming its previous direction.

Now, this instance shows how important the emergency service connection between Wisconsin Electric Power Company and Wisconsin Michigan Power Company can be to the latter company.

Had that connection not been in place, loads in the southern portion of the territory of Wisconsin-Michigan Power Company would have had to be dropped until the 3384 Appleton steam plant could have been brought into operation sufficiently to pick it up.

From 10:40 to 11:07—27 minutes—it is doubtful that enough units in the Appleton district could have been into service within that length of time to have picked up the load by the time the service was restored on the transmission line.

I should have stated, when I was describing the emergency service, that this service is available automatically, as indicated by this example, and is not withheld except on

request, as in the case of firm steam power and dump steam power.

—1,563—

The emergency service is intended to maintain continuity of service on the systems of the companies, and it doesn't matter whether someone requests it or not, the interests of the customers are safeguarded by making these emergency arrangements continuously effective, so that they go into operation purely automatically without even requiring the throwing of switches. 3386

This flow of energy reversed of its own accord because of the shifting of supply and load conditions on the system.

Q. When you say "automatic", do you mean that it was not even necessary for the load dispatcher in Milwaukee to be advised of the outage in the transmission line coming down from Twin Falls? A. Yes, I mean that. The line went out of service and the power was shut off. At that instant the flow reversed in the Milwaukee-Appleton line because there was load in the Appleton area across the line, which load was not being satisfied from the former source.

It immediately began drawing power from the only electrical source connected to it, which was the 132,000-volt line from Milwaukee. 3387

In each instance, after emergency service is taken, a dispatcher's report is made and the company taking the service notifies the company furnishing it as to the exact circumstances and the duration of the service.

—1,564—

That is one of the provisions of the contract, this arrangement being based upon the fact that the company re-

ceiving the emergency service is in better position to measure its time of occurrence and its nature than the company supplying it.

The only evidence of that line outage which appeared at the power plant of Wisconsin Electric Power Company was an increase in the loads carried on the generating units.

The magnitude of the load shifted to these plants was not sufficiently great to cause any drop in frequency. It didn't cause any drop in voltage.

3389

—1,565—

Momentarily when the load comes on what happens is that the units tend to slow down slightly because of the additional pull on the generators. As soon as that speed drops ever so little the governors on the turbines open the steam throttles and supply more steam to the turbines. They immediately regain the speed for which the governors are set and the units go on carrying the increased load.

Certain types of outages do cause drops in voltage or frequency, or if the outage is of a type that suddenly relieves a plant of a part of its load the frequency and voltage
3390 will momentarily increase, but those changes must be of appreciable magnitude in proportion to the load carried by the units. This one wasn't of sufficient magnitude to cause any such flutter in voltage or frequency.

Q. In the instance you mentioned had it not been for the energy connection running south the Appleton territory would have been without electric service for the period of the interruption of the line running from Twin Falls to Appleton, is that correct? A. It would not have been entirely without service, no, because the Oconto Falls plant

was operating and the Weyauwego plant was available for operation and a hydro-electric plant can be started much more quickly than a steam plant.

There was undoubtedly some spinning reserve in operation at the Appleton plant, so that the company probably would have been able to maintain reduced service over a

—1,566—

portion of the area and complete service over a part of it, or possibly reduced service over the entire area. At any rate, service to the customers would have been affected. To what 3392
extent one could not answer without making a careful analysis of all the generating equipment in service and available for service immediately.

If it had not been for the presence of the transmission line from Appleton to Milwaukee, Wisconsin Michigan Power Company would have been at that time, and would be at all other times, required in the cause of continuity of service to carry spinning reserve at the Appleton steam plant of capacity equal to the capacity being received over the transmission line from the Twin Falls plant.

Q. And the result of that operation would be an increase 3393
in operating expense? A. An appreciable increase, yes.

The Examiner: Let us have a five-minute recess.

(Whereupon, after a brief recess the hearing resumed.)

By Mr. Hamilton:

Q. In addition to the interchange of energy at the interconnections to which you have already referred, are there other operating matters in which the companies comprising

3394 *Edward H. Schmidtman—By Respondents—Direct*

the Wisconsin Michigan group cooperate? A. Yes, there are a number of such matters. One respect in which the three

—1,567—

companies of the Wisconsin Michigan group cooperate is in the utilization of spare operating equipment. When the company has equipment which it does not need at one time and which is needed by one of the other two companies in expanding or altering or strengthening its transmission or distribution system, the company owning the equipment will sell
3395 it to the other. Through this arrangement a good many transactions have been carried out between the companies to their mutual advantage.

In 1931 the loads in the area served by the Brown Deer sub-station, which appears on Exhibit 32, had increased to such a point that it was necessary to make some change in the distribution sub-station located there.

Q. That is a sub-station of Wisconsin Gas & Electric Company, is it? A. At that time the Brown Deer sub-station was owned by Wisconsin Gas & Electric Company. This sub-
3396 station supplied energy to numerous distribution lines, some of which extended out into the territory served by Wisconsin Gas & Electric Company, and some of which extended into the electric service territory of Wisconsin Electric Power Company.

Studies were made of the entire situation to determine what should be done about improving operating conditions at that point and it was found that certain of the operating problems related to that sub-station would be simplified if the

—1,568—

sub-station were owned and operated by Wisconsin Electric Power Company. It was decided that Wisconsin Electric Power Company should build a new and larger sub-station and should carry the loads of both companies in this area from that sub-station.

In order to keep Wisconsin Gas from having on its hands a sub-station for which it had no use it was decided that Wisconsin Electric Power Company would buy from Wisconsin Gas all those portions of the equipment in the Brown Deer sub-station that could be used on the system of Wisconsin 3398
Electric Power Company, and that Wisconsin Gas would make use of the remaining portions, that is those portions which it desired to retain, in its own operations.

The sub-station was sold to Wisconsin Electric Power Company after an inventory of all equipment in the station and a valuation of that equipment at original cost. Depreciation was computed in accordance with the life of the equipment and the depreciation rates at which depreciation is provided for such items of sub-station equipment and the net price was the cost new less depreciation.

This transaction involved a consideration of approxi- 3399
mately $8,200 and reduced the cost of the new sub-station somewhat because some of the equipment was installed in the new sub-station and also relieved Wisconsin Gas & Electric Company of an investment in a sub-station and equipment for which it had no immediate use.

—1,569—

The main power transformer and portions of the switchboards and certain other parts of the sub-station were retained by Wisconsin Gas & Electric Company because it had

3400 use for those items elsewhere in its distribution system. Transactions of this kind are carried out at original cost less depreciation in accordance with the requirements of the Public Service Commission of Wisconsin.

The accounting that was done in this instance on the books of Wisconsin Gas & Electric Company was to write off from fixed capital the entire Brown Deer sub-station, charging the depreciation reserve with the amount of depreciation which had been deducted from the original cost
3401 in determining the consideration, and charging the amount received to cash.

On the books of Wisconsin Electric Power Company the equipment purchased was taken in at original cost as specified by the classification of accounts and there was set up in the depreciation reserve of Wisconsin Electric Power Company an amount equal to the depreciation which had been deducted from the original cost in determining the net price to be paid.

As a result of those transactions the Brown Deer sub-station disappeared entirely from the fixed capital records
3402 of Wisconsin Gas & Electric Company. The depreciation which Wisconsin Gas & Electric Company had accrued during the period of service of the Brown Deer sub-station also disappeared from the books and Wisconsin Gas cash account reflected the fact that the company then had in the bank

—1,570—

the additional cash represented by the consideration received from Wisconsin Electric Power Company.

On the books of Wisconsin Electric Power Company, however, fixed capital in service showed the original cost of the

equipment purchased from Wisconsin Gas & Electric Company and the depreciation account showed an accumulation sufficient to offset the depreciation actually experienced by that property before Wisconsin Electric Company bought it.

Wisconsin Electric Power Company then continued accumulating depreciation on that equipment in terms of its over-all life, rather than its remaining life, so that when the over-all life has been served there will be in the depreciation reserve of Wisconsin Electric Power Company, a sufficient accumulation to write off that original cost. 3404

Miss Calkins: Does one of these companies ever lease equipment from another?

The Witness: They don't lease operating equipment ordinarily. They do lease property and they make joint use of certain buildings and land in which——

Miss Calkins: Well, I didn't mean that. I had reference to machinery that might be used on construction jobs and things of that kind.

3405

The Witness: I know of no instances where that has been done with the exception of electric service trucks which Wisconsin Electric Power Company

--1,571—

rents from Wisconsin Gas & Electric Company in carrying out its operations.

Miss Calkins: But there isn't, generally speaking, any common use of any large amount of equipment owned by the respective companies?

3406 The Witness: No, there is not. Each company provides its own equipment for construction and maintenance purposes in general.

The companies are large enough to make it unnecessary for joint use of equipment of that kind. In instances where the relationship of the two companies with respect to territory and facilities and customers makes it advantageous for certain operations to be carried out jointly, advantage is taken of those oppor-
3407 tunities. I will explain several of those.

By Mr. Hamilton:

Q. Go ahead. A. Another instance of cooperation between the companies in the utilization of spare operating equipment occurred in 1933 when Wisconsin Gas & Electric Company constructed a sub-station at Elkhart Lake on the transmission line of Wisconsin Electric Power Company between Granville and Appleton.

Elkhart Lake appears on Exhibit 32 in the northern portion of the electric service area of Wisconsin Gas & Electric
3408 Company.

This sub-station required the installation of 132,000 volt transformers which Wisconsin Gas & Electric Company did not have in stock at that time. The old Granville sub-station

to which I have previously referred, had been taken out of service prior to 1933 and the transformers were still standing in place, although they were not in use.

These transformers were sold to Wisconsin Gas & Electric Company for installation in its sub-station which was

being built at Elkhart Lake. The transformers had been out of service for sometime and being of the outdoor type had been standing out in the weather. They were built for such service, however, and had not suffered any depreciation beyond that normally attending the life of the transformers at that time.

Due to their being out of operation, however, they had accumulated some moisture in the oil which insulated the winding of the transformers and in determining the price which was to be paid by Wisconsin Gas & Electric Company 3410
to Wisconsin Electric Power Company allowance was made for the cost of drying out the oil and of other minor maintenance operations which were necessary to place the transformers into good operating conditions consistent with their age.

Here again the price was based on original cost less depreciation determined according to the proper depreciation rate for that class of equipment and the age of the transformers. The consideration was $22,000 for the three transformers. Those transformers stepped down the voltage from 132,000 volts to 26,400 volts and have a rated capacity of 16,067 3411
k. v. a. each, making a total sub-station capacity of 5,000 —1,573— k. v. a.

The price was about $22,600.00, which was scarcely more than half what it would have cost Wisconsin Gas & Electric Company to buy new transformers for that same installation.

The transformers are in good operating condition and for all practical purposes are equally as useful as new transformers purchased at that time would have been.

3412 *Edward H. Schmidtman—By Respondents—Direct*

As I recall, they were eight or nine years old at the time.

Another instance of the transfer of available equipment from one company to another occurred in 1939 when Wisconsin Gas & Electric Company decided to make some changes in its 132,000 volt sub-station in Kenosha.

These changes involved the removal of two 132,000 volt oil circuit breakers, and several sets of 132,000 volt disconnecting switches.

These oil circuit breakers formerly served on the 132,000
3413 volt transmission connection between Kenosha and the Illinois state line which has since been taken out of service. Inasmuch as Wisconsin Gas & Electric Company no longer had need for these circuit breakers and disconnecting switches, they were made available to the other two companies of the group.

Wisconsin Michigan Power Company recently found itself in need of such a circuit breaker for one of its substations and purchased one of the two from Wisconsin Gas

& Electric Company at a price which recognized the original
3414 cost, the age, as a measure of depreciation, and the operating condition of the breakers.

Subsequently, Wisconsin Electric Power Company needed an oil circuit breaker of that type and purchased the second one from Wisconsin Gas & Electric Company.

In this case, it was found that it would be necessary to overhaul the circuit breaker in order to place it in good operating condition and in order to meet the requirements of Wisconsin Electric Power Company it was also necessary to make some alterations in the control equipment in order

3415

to give the circuit breaker a higher current rupturing capacity.

The cost of overhauling and reconstructing the circuit breaker was divided into two classes; one, the costs incurred in placing the breaker into reasonable operating condition, and the other, the cost incurred in increasing its current rupturing capacity.

The first portion of these costs was deducted from the original cost less depreciation figure because it was a cost required in bringing the circuit breaker up to the condition indicated by the depreciated value.

3416

The remaining expenditure was an improvement in the capacity of the breaker and had nothing to do with the

—1,575—

breaker in its present condition and its present rating.

Now, this transaction took two very expensive pieces of equipment off the hands of Wisconsin Gas & Electric Company. They were standing there in the Albers Street Sub-station and weren't rendering any service.

Cost estimates on similar breakers had been obtained by both Wisconsin Michigan Power Company and Wisconsin Electric Power Company, and in the case of the latter the quotation was between seventeen thousand and twenty thousand dollars.

3417

The price paid for these breakers was something on the order of seven thousand or seven thousand five hundred. I don't recall the exact figure, but the comparison of these figures indicates the amount of the saving realized.

3418 A large part of the difference between the cost of new circuit breakers and the ones that were purchased from Wisconsin Gas & Electric Company comes about from the fact that the old ones were purchased at a time when electrical equipment wasn't as expensive as it is now, and also because of the fact that the old breakers do not have some of the modern control refinements that the new ones have.

Since the old breakers would serve the purpose, however, it was felt that there was good economy on the part of both
3419 the purchasing companies and the selling company to transfer the equipment.

—1,576—

Wisconsin Electric Power Company is going to install the circuit breaker if purchased from Wisconsin Gas & Electric Company in the new 132,000 volt, 66,000 volt sub-station which I mentioned as being under construction at 96th Street on the Lakeside-Granville transmission line.

Q. Turning to still other phases of joint operation, you have testified, have you not, that Wisconsin Electric Power Company furnishes steam to the Racine Gas Works of the
3420 Wisconsin Gas & Electric Company? A. Yes, I have.

Wisconsin Gas & Electric Company requires substantial quantities of steam for the operation of its gas plant in Racine and obtains that steam from the Racine Power Plant of Wisconsin Electric Power Company.

The steam is generated in the boiler plant of the power station and is billed to Wisconsin Gas & Electric Company at the actual cost of production—that is, the actual cost of furnishing the service.

Q. The use of that steam is necessary, is it, to the operation of the gas works? A. Yes, it is. It is necessary. If

Wisconsin Gas & Electric Company were unable to obtain the steam from a source such as this, it would have to put up a boiler plant of its own.

In 1939, it purchased $26,000.00 worth of steam from

—1,577—

Wisconsin Electric Power Company.

The Racine Power Plant is not in regular electrical generating operation as I have explained, but the boilers are kept hot for two reasons, one of which is to keep the plant continuously available for emergency electric generating 3422
service and the other to furnish steam to the Racine Gas Plant.

The boilers are there. The operating force is there, and the boilers are kept under pressure and so the only added cost of furnishing the steam to the gas plant is that of the incremental costs above those that would be incurred in simply holding the plant as available steam generating reserve.

Q. And that service is rendered to Wisconsin Gas at cost, is it? A. Yes, it is rendered at cost, the cost including apportionments of labor and other maintenance expenses, fuel, 3423
and proportionate fixed charges on the investment devoted to the steam service.

Q. Does Wisconsin Gas & Electric Company perform any services for Wisconsin Electric Power Company at Racine Power Plant? A. Yes, it does. The operation of the Racine Power Plant produces considerable quantities of ashes from the boilers. These boilers are stoker-fired, as I have explained, and it is necessary to dispose of these ashes.

—1,578—

3424 Wisconsin Gas & Electric Company hauls them away in trucks and dumps them at points provided for that purpose. The charge for the service is based on the cost of rendering it.

Wisconsin Gas & Electric Company operates a number of trucks in the Racine district in connection with the operation of its gas utility in handling of coke and coal, and so forth, and makes these trucks available for hauling away the ashes from the power plant.

Q. Have you any idea as to the amount of coal burned
3425 at that plant, on a daily basis? A. I can look that up. In the year 1939, the Racine Power Plant consumed 6,060 tons of fuel. That fuel is made up of eastern screenings and coke breeze from the coke gas plant of Wisconsin Gas & Electric Company. On a daily basis——

Q. (Interposing) Well, that is sufficient. A. All right.

Q. Does Wisconsin Michigan Power Company perform line patrol services for Wisconsin Electric Power Company? A. Yes, it does perform such services on that section of the 132,000 volt transmission line of the Wisconsin Electric Power Company which lies north of Plymouth, which is
3426 shown on Exhibit 32.

This section of line is nearer to the territory of Wis-

consin Michigan Power Company than it is to the territory of Wisconsin Electric Power Company, and it is, therefore, more convenient and economical to have patrol service along this fifty-mile section performed by patrol crews of Wisconsin Michigan Power Company than it would be to have the patrolling done by personnel of Wisconsin Electric Power Company.

Q. That service is rendered at cost? A. Yes. The time spent and the facilities used in patrolling the line are covered by the billings made for the service, which are at actual cost.

Q. Are there instances of joint use of sub-stations by the respective companies? A. Yes, there are certain sub-stations which are used jointly by Wisconsin Electric Power Company and Wisconsin Gas & Electric Company.

One of these is located in Waukesha. The sub-station at this point is owned by Wisconsin Gas & Electric Com- 3428
pany, and Wisconsin Electric Power Company has certain equipment located in the sub-station.

The equipment located in the sub-station is operated by the personnel of Wisconsin Gas & Electric Company, and Wisconsin Electric Power Company shares the operating and maintenance costs of the sub-station, in addition to paying an equitable rent for the utilization of floor space in the

building.

This joint use of property and personnel eliminates the necessity for two separate installations and two separate 3429
operating crews.

The rental for floor space is based upon investment in land and structure distributed on a floor space area in accordance with the amount of space used by each of the two companies.

The rent includes taxes, depreciation, and maintenance expense, as well as interest on investment.

Another sub-station which is occupied jointly by Wisconsin Electric Power Company, and Wisconsin Gas & Elec-

3430 *Edward H. Schmidtman—By Respondents—Direct*

tric Company, is located at Watertown, which appears on Exhibit 32.

In this case, the sub-station is owned by Wisconsin Electric Power Company. That is, the sub-station equipment is owned by Wisconsin Electric Power Company and it is located in the sub-station building and power plant building of Wisconsin Gas & Electric Company under an arrangement similar to that at Waukesha.

The station and power plant equipment are operated by
3431 personnel of Wisconsin Electric Power Company of Watertown, however, and Wisconsin Gas & Electric Company shares the cost of operation.

It is billed for its proportion of the operating cost monthly.

—1,581—

Wisconsin Electric Power Company, on the other hand, pays a monthly rental to Wisconsin Gas & Electric Company for its use of the investment in land and buildings. A special operating expense job order is maintained by Wisconsin Electric Power Company to cover the expenses in-
3432 curred in operating and maintaining the watertown substation. The charges to this job order are summarized monthly, and are divided between the two companies in proportion to their relative use of the facilities in the substation. This relative use is measured by the kilowatt hours output of the equipment in the station, the number of switching operations, and the various other phases involved in operating the combined power plant and sub-station property.

Q. Are there instances of joint use of office facilities?
A. Yes, there are. Wisconsin Gas & Electric Company owns

3433

and operates a gas production and distribution system in the city of Racine and has its general offices in that city.

The electric system in Racine, however, is owned and operated by Wisconsin Electric Power Company, the Racine division offices of Wisconsin Electric Power Company being located in Racine.

Because of economies that can be realized through combining the main offices of Wisconsin Gas & Electric Company

—1,582—

with the divisional offices of Wisconsin Electric Power Company, these two sets of offices occupy common buildings and utilize, to a considerable extent, the same office personnel and office equipment.

3434

The buildings are owned by Wisconsin Gas & Electric Company and for the most part; the office personnel working in the buildings are on the payroll of that company.

Some of the personnel are on the payroll of Wisconsin Electric Power Company, however.

Wisconsin Electric Power Company makes a monthly payment to Wisconsin Gas & Electric Company covering rent for the use of the buildings of the latter company and covering an apportionment of the salaries of those employees on the payroll of Wisconsin Gas & Electric Company who do work in behalf of Wisconsin Electric Power, and also covering the rent for the use of office equipment, including tables, chairs, desks, files, safes, typewriters and other equipment, and also rent for the use of the buildings.

3435

This monthly payment is subject to annual revision according to the terms of the agreement. The annual revision involves a complete survey of the use of the personnel, build-

ings and equipment at the end of October in each calendar year.

The rentals are revised according to conditions as of that date and become effective on the first of the following

—1,583—

calendar year.

The revision is made as of October 31 and made effective as of the following January 1, because it takes about two months in order to complete the study and get the rentals
3437 worked out on a practical basis.

Q. Are there instances of joint meter reading? A. Yes; I have pointed out that Wisconsin Gas & Electric Company operates the gas business in Racine while Wisconsin Electric Power Company operates the electric business in Racine.

Many of the customers of the gas system are also customers of the electric system and for a number of years, the gas meters were read by gas company employees and the electric meters were read by electric company employees.

Now, however, both meters are read by one crew of meter readers.

3438 Some amusing incidents occurred in the earlier years when the gas meter reader would come in the morning, the electric meter reader would come in the afternoon, and if it happened to be a particularly muddy day, the housewives didn't think it was a very sensible arrangement.

The meter reading, however, is now carried out jointly by one crew of meter readers and they read both the electric and gas meters. That not only saves the patience of our customers, but it saves considerable money by eliminating double traveling time between stops.

—1,584—

3439

It takes a man about so much time to read a meter and no saving in the reading, itself, is made, but when a man can read two meters for a given amount of travel between stops he can eliminate a substantial portion of the unproductive time involved in the operation.

Delivering of bills is also done by one staff of bill deliverers. They deliver bills for both electric and gas service in Racine. The personnel in the company offices who receive payment of bills, also receive payment for both electric and gas service.

3440

The handling of service applications at the application desk is done jointly for both gas and electric operations in Racine.

Q. Do these joint operations in Racine result in economies to both companies? A. Yes, they do. It seems almost obvious that the maintenance of one crew for one operation and another crew for another similar operation would be much more expensive than having one slightly larger crew do both jobs.

Previously, there were separate application desks, requiring separate personnel. Trouble calls are also handled jointly for both systems by the trouble service crews.

3441

The cost of such joint operations are shared between the two companies on the basis of service rendered for each;

trouble service is billed on the basis of number of trouble calls and time spent, meter reading on the basis of number of meters read, and the time required to read the meters, and service applications on the basis of number of applications received for each class of service.

3442 *Edward H. Schmidtman—By Respondents—Direct*

Q. Are there instances of joint use of telephone facilities? A. Yes, there are. Wisconsin Gas & Electric Company makes quite extensive use of the private telephone system owned and operated by Wisconsin Electric Power Company.

This telephone system includes an automatic exchange in the Public Service Building, which is the main office building of Wisconsin Electric Power Company in Milwaukee, and a number of trunk lines reaching out to Racine and Kenosha on the south, and out along the routes of the inter-
3443 urban railways to the west and to the north.

The trunk lines between Milwaukee and Racine and Kenosha are used very extensively in telephone communications between Wisconsin Gas & Electric Company and Wisconsin Electric Power Company, particularly between Racine and Milwaukee, and are used for Wisconsin Gas & Electric Company business very largely between Racine and Kenosha.

The telephone lines which follow the routes of the interurban rail lines into the outlying districts are known as dispatch lines and have instruments attached to most of the stations along the rail lines and at many points between
3444 —1,586—
the stations.

These outlying telephone stations are used by Wisconsin Gas & Electric people in telephoning the main office to report outage of lines and to report other sorts of trouble on the system.

One of the portions of the agreement between Wisconsin Electric Power Company and Wisconsin Gas & Electric Company covering the joint use of offices in Racine covers the division of the costs and fixed charges connected with

the operation of the private telephone system of the Wisconsin Electric Power Company.

Wisconsin Gas & Electric is charged a share of the expenses charged to the telephone operating expense job order and is also charged a share of the fixed charges assignable to the investment in communications equipment, such share being based upon the number of telephone instruments assigned wholly or partially to the use of the Wisconsin Gas & Electric Company.

Q. Does this arrangement result in lower costs to Wis 3446
consin Gas & Electric Company? A. Yes, it does. Wisconsin Gas & Electric Company has taken some telephone service within its own buildings from the Wisconsin Telephone Company, but for service between Racine and Kenosha and Milwaukee, most of the communications are done on the

private system of Wisconsin Electric Power.

This communication is carried out at considerable saving because if it weren't for the system of Wisconsin Electric Power Company, all such calls would be made at toll rates 3447
which would result in costs considerably above the costs assigned to Wisconsin Gas & Electric Company by Wisconsin Electric Power.

Many of the telephone calls made from out in the rural territory of Wisconsin Gas & Electric Company come over the commercial lines of the telephone company because the private system of Wisconsin Electric Power doesn't reach into all parts of that territory.

Wherever it is possible, though, these calls are made over the dispatch lines and the toll call is eliminated.

Q. Does Wisconsin Electric Power Company buy coal for use at the Racine power plant of Wisconsin Gas & Electric? A. Yes. In answer to a previous question, I testified that about 6,000 tons of coal were burned at the Racine Power Plant in 1939.

A considerably larger quantity than this is consumed in the coal gas plant of Wisconsin Gas & Electric Company at Racine, and because of the large coal purchases for gas operations, Wisconsin Gas & Electric Company is able to
3449 earn a lower rate for its coal than would be given Wisconsin

Electric Power Company in the purchase of its power plant coal alone.

The benefits of the lower price enjoyed by Wisconsin Gas & Electric Company are passed on to Wisconsin Electric Power Company by an arrangement under which the latter company pays the actual costs to the former.

Q. How about joint use of cars and trucks in the respective companies? A. In carrying out its gas operations in the
3450 Racine division, Wisconsin Gas & Electric Company finds it necessary to own and operate a relatively large fleet of automobiles and trucks.

Wisconsin Electric Power Company rents such trucks from Wisconsin Gas & Electric Company for use in operating and maintaining the electric properties in the Racine area.

Wisconsin Gas & Electric Company operates a garage for storing, servicing and maintaining these automobiles and trucks and by renting such equipment, Wisconsin Electric Power Company is able to avoid the necessity of having a separate garage with separate maintenance crews.

3451

Joint use of automotive equipment makes it possible for the two companies to take advantage of diversity in their requirements, also. It would be necessary, if each company maintained its own fleet of trucks, to have enough trucks to take care of any emergency that might arise; in other words,

—1,589—

to have reserve or spare capacity.

By combining the requirements of the two companies, such spare capacity serves the needs of both and results in a smaller number of machines than would be required if they operated separately in this respect.

3452

Q. Would you say, then, that the result of this arrangement, again, is the achievement of reduction in operating costs? A. Yes, it is. It does achieve such reduction in costs.

Q. Have you indicated the basis of rentals paid by Wisconsin Electric Power Company? Is the basis here again on actual cost? A. Yes, the rental is an hourly charge which varies according to the size and type of vehicle involved.

This hourly charge includes the fixed charges on the investment in the vehicle, a rent for the space it occupies for storage purposes, fixed charges on the building and tools and other equipment required in the maintenance of the vehicle, and the labor expense involved in those operations.

3453

Wisconsin Electric Power Company furnishes the drivers for the trucks but that is the only part of the operation of the automotive equipment used in the Racine district that is furnished directly by Wisconsin Electric Power Company. The trucks, themselves, and all operations incident to fur-

—1,590—

nishing them, are supplied by Wisconsin Gas & Electric Company, and the rate paid is calculated to cover costs, all elements of costs, but not including any profit.

Q. At the outset of your testimony, you spoke briefly of the Operating Research Bureau. Could you elaborate on your original statement in order to bring out the services furnished by that bureau to the three companies? A. The Operating Research Bureau is a department of the Wisconsin Electric Power Company which is operated for the pur-
3455 pose of providing all three companies of the Wisconsin-Michigan group with certain accounting, statistical and other special services at cost.

The employees in the Operating Research Bureau are on the payroll of Wisconsin Electric Power Company and the charges made to Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company for the services of this department are based upon the actual time spent by the employees doing work for such other companies, and the expenses incurred in doing that work.

In addition to direct labor charges, the costs billed in-
3456 clude such general things as stationery, and a portion of the salaries of the individuals supervising the operation of the department.

Q. And would you elaborate further on the scope of the services which the Operating Research Bureau renders? A.

One of the types of service rendered by the Operating Research Bureau is that of accounting and auditing. This department conducts the internal audits carried out by the company in auditing its own books in accordance with requirements in connection with financing issues.

This auditing work involves the preparation of detailed reports on the investigations of various accounts and classes of accounts, including periodic audits of the cash position of the companies, such audits being unannounced as to time of occurrence, inspections of the petty cash accounts, expense reports, the manner in which the different companies are carrying out their billing procedures in terms of the provisions of the more involved rate schedules, and numerous other studies of that general type.

The auditing group has also made extensive studies re- 3458
quired in connection with property classifications, such as the studies necessary in working out the original costs of the properties of the companies as required by regulatory authority, and the making of depreciation studies for the purpose of determining proper depreciation rates to be applied to various classes of the operating properties of the companies.

The auditing division also assists in the preparation of accounting data for the annual reports to various regulatory authorities, including the Public Service Commission, Fed-
—1,592— 3459
eral Power Commission, the Wisconsin Tax Commission, and in the case of Wisconsin Michigan Power Company, the different Michigan commissions with authority over the operations of the company.

The Operating Research Bureau also renders extensive tax consulting service to all three companies of the group. The people who do this kind of work make searching audits of the income tax returns of the companies and prepare material to be used in behalf of the companies at conferences

3460 *Edward H. Schmidtman—By Respondents—Direct*

and hearings or other appearances before the tax commissions of the two states of Wisconsin and Michigan and take part in negotiations relating to the assessments of ad valorem tax on the operating utility properties of the companies.

Q. Does the bureau perform services for all three companies in preparing such matters as registration statements, filings under the Securities Act, the Exchange Act, and the Public Utility Holding Company Act? A. Yes, it does. It has participated in the preparation of all such material and
3461 statements which have been prepared for the three companies.

Q. And the preparation of original cost studies? A. Yes. It makes those studies and it has completed such studies for all three companies of the group and has reported the results of those analyses to the proper regulatory bodies.

—1,593—

Q. Does it handle bonus questions? A. Yes. A rather large division of the Operating Research Bureau works exclusively on bonus and wage incentive plans, which have resulted in considerably increased output of labor employed
3462 by the company and have also resulted in considerably increased earnings for the employees. The gain-sharing division, which is the name by which this group is designated, makes extensive time studies of all jobs amenable to that type of treatment.

They then establish what are referred to as standard time allowances which represent the amounts of time which an average employee should spend in performing certain operations incident to his work.

Having established standard time allowances, they develop bonus rates which are paid to the employee who performs his work in time which is less than that provided by the standard time allowances for these various operations. The payment to the employee for such superior performance amounts to 40 per cent. of the actual wage for the amount of time saved. 40 per cent. is retained by the company and 20 per cent. is used in the development and administration of the plans.

Thus, the cost of the plans are covered and the saving 3464
above that is divided equally between the employee and the company. Some of the employees of Wisconsin Electric Power Company, with whom I happen to be the most fa-

miliar, earn bonuses ranging as high as 60 per cent. of their monthly wage. Some of them earn no bonus at all.

The new employees who are still new and unfamiliar at their work sometimes earn a negative bonus. In such cases, however, the employee is not penalized but receives his base pay.

Q. Before leaving this department, do you feel that the 3465
operations of the bureau on a joint basis—that is, making the services available to all three companies—results in a reduction of costs in the type of service rendered the respective companies? A. Yes. I feel that it does result in costs of such services and I am sure that all three of the companies feel that way about it, too.

Q. It does result in a reduction in costs? A. A reduction in cost of the type of service rendered by the operating service bureau.

3466 Q. And also an increase and maintenance of a high level of efficiency in the work done by the department, which perhaps would not be available if the work were performed by the individual companies? A. We feel that way about it, yes. Being in that department, perhaps, I should be a little modest about it.

Q. I wouldn't. A. But the management of the three com-

—1,595—

panies has indicated on numerous occasions that they are
3467 well satisfied with the quality of service rendered by the department and are very well satisfied with the low costs at which the three companies receive those services.

There are a large percentage of graduate engineers, graduate accountants, employed in the department. The various groups carry on their special lines of work and some of the people in the department do general investigational work.

The work is generally on a very high plane of quality and has apparently been very satisfactory, and I am sure has been very economical.

3468 The Examiner: Well, would the three companies, if left to their own resources, render as good or even better service than the services rendered through the bureau?

The Witness: I am quite sure they would not. Perhaps I don't understand your question. By "service," do you refer to service to the customers, or these special services to the management of the company?

The Examiner: Special services to the management of the company. That is what you were referring to, wasn't it, Mr. Hamilton?

Mr. Hamilton: That is right.

The Witness: I don't think it would be possible for a separate smaller group within each company to serve the companies as adequately and as economically as the Operating Research Bureau does.

—1,596—

The Bureau being a central body, working in the interests of all three companies, is able to coordinate and consolidate many of these investigations on a basis that would be very difficult if the three operated separately. 3470

In considering questions related to taxes, for example, the same uniform policies are followed with respect to all three companies on tax matters.

The auditing is carried out in such a way that when certain weaknesses in accounting practices are discovered in the case of one company, those same things are looked for and eliminated in the case of the others where groups working separately wouldn't have the benefit of the broader experience that has been gained by the department working in general with all three. 3471

The Examiner: Isn't that a good point to stop for lunch?

Mr. Hamilton: Yes.

The Examiner: Very well, we will recess until 2:00 o'clock.

(Whereupon, at 12:35 o'clock p. m., the hearing recessed to reconvene at 2:00 o'clock p. m.)

—1,597—

3472 *Edward H. Schmidtman—By Respondents—Direct*

AFTERNOON SESSION

(The hearing was resumed at 2:00 P. M.)

The Examiner: You may proceed.

Whereupon EDWARD H. SCHMIDTMAN the witness on the stand at time of recess, resumed the stand, was examined and further testified as follows:

3473 *Direct Examination by Mr. Hamilton (resumed):*

Q. Does Wisconsin Electric Power Company furnish printing service to its affiliated companies in the Wisconsin Michigan group? A. Yes, it does. The printing department of Wisconsin Electric Power Company prints such things as letterheads, and accounting forms, and various other items of printed material for both Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company.

This service is billed to the affiliates at cost and results in lower costs to them than would be the case if they had
3474 the printing done by outside concerns.

Q. The cost being on the basis of an allocation of direct labor and materials and supplies devoted to the process? A. Yes. That is the basis on which the cost is determined. It includes labor and materials and use of machines and

other equipment, and property employed in the service.

Q. In that connection you maintain a small printing plant, do you not, in Milwaukee? A. Yes. Wisconsin Electric Power Company maintains a printing plant which is operated by printing department personnel.

The costs of operating the printing plant are met directly by Wisconsin Electric Power Company, and the services of that plant, for the other companies, are billed to them as a direct item of expense.

Q. Does Wisconsin Electric Power Company perform stock transfer and other related services for the other two affiliated companies? A. Yes. Wisconsin Electric Power Company maintains stockholders' records and issues dividend checks for Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company. 3476

This service is rendered by the same staff and in the same offices as that which renders similar services for Wisconsin Electric Power Company.

The charge which is made to the affiliated companies for such service is based on cost.

Q. Do any of the companies perform emergency line work for either of the other two companies? A. Wisconsin Electric Power Company and Wisconsin Gas & Electric Company have an operating arrangement, under which line repair crews of one company are made available to perform 3477 emergency work on the system of the other.

—1,599—

Work of this kind is done only in cases of major outages due to storms or other causes, and makes it possible for the repair services not being used by one company to be called upon by the other, to restore the lines to operation as soon as possible.

By this interchange of repair crews and trucks, it is possible for the two companies to get along with fewer personnel and less equipment of that kind than would be the case if

3478 *Edward H. Schmidtman—By Respondents—Direct*

each operated alone, and some saving is realized through this arrangement.

Q. Are collection services performed jointly in certain territories? A. In the cities of Cudahy and South Milwaukee, where Wisconsin Gas & Electric Company renders gas service, and Wisconsin Electric Power Company renders electric service, the collection of all past-due service accounts is carried on jointly for the two companies.

The issuing of connection and disconnection notices and
3479 the collection of cut-off accounts, and petty ledger accounts, are also handled for both companies by personnel of Wisconsin Electric Power Company.

The cost of rendering such services for Wisconsin Gas &

—1,600—

Electric Company is billed to that company.

By doing this work for both companies the personnel of Wisconsin Electric Power Company make it necessary for Wisconsin Gas & Electric Company to maintain similar personnel in those communities.

Q. Are there reciprocal pole contact agreements among
3480 the companies? A. There are such agreements between Wisconsin Gas & Electric Company and Wisconsin Electric Power Company. The electric service territories of these two companies are immediately adjacent and there are numerous instances in which it is desirable for the wires of one company to be carried on the poles of the other.

In order to eliminate the need for extensive accounting and billing for the reciprocal use of each other's poles, the two companies have agreed that each shall be permitted, without charge, to string its conductors on the existing poles of the other company.

We refer to this as a reciprocal pole contact agreement. The arrangement makes it possible to carry the lines of both companies, where they coincide, with one row of poles, eliminating the need for two rows, and the reciprocal aspect of it eliminates the need for accounting and billing for such use.

Q. Is the effect of these arrangements also to effect economies, in that additional rights of way are unnecessary? A. —1,601—
Yes, that would come into the picture if the arrangement 3482
were not in effect and each company had to provide its own pole lines.

Q. Additional rights of way would be required? A. Additional rights of way would be required in some instances, and additional line construction would be required.

Q. Are these arrangements applicable to a substantial extent of lines? A. Yes, they are. I don't know offhand just how many poles are used jointly in the systems of the two companies, but, from my knowledge of the positions of the two systems, I am sure that there must be thousands 3483
of poles so used.

Q. You have spoken of the joint use of office space in Racine, I believe. Are there other cities in which office space is exchanged? A. Yes, there are two. The offices in Racine, in Cudahy, and in South Milwaukee are used jointly by both Wisconsin Electric Power Company and Wisconsin Gas & Electric Company.

In Cudahy the office is maintained by Wisconsin Electric Power Company and is used by Wisconsin—I must correct that. The office is maintained by Wisconsin Gas & Electric

3484 Company and is also occupied by Wisconsin Electric Power Company.

In South Milwaukee the situation is reversed and the two

—1,602—

arrangements are regarded as offsetting each other, with respect to cost and value of service rendered, so no billings for use of facilities are made in connection with these two joint offices.

Q. And here again, does the joint arrangement result in
3485 economies? A. Yes, it does. It makes it possible for the two companies to perform their business in each of the two cities in a total of two offices, rather than four.

The people who operate the offices serve both companies, being employees of one company in one instance and of the other company in the other instance.

Q. Employees of the company operating the particular office? A. Yes.

Q. Are there, from time to time, sales of materials and stock among the three companies? A. Yes, there are. There is in effect between the three companies an agreement under
3486 which Wisconsin Electric Power Company furnishes materials from its stock to Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company.

Wisconsin Electric Power Company, being the largest company of the three, makes the greatest purchases of materials used in electric operations, and, because of those large purchases, is able to earn quantity discounts, which the other

—1,603—

two companies could not earn, in some cases, because of their smaller purchases.

Edward H. Schmidtman—By Respondents—Direct 3487

In cases where savings can be made through the utilization of these quantity discounts, Wisconsin Michigan Power Company and Wisconsin Gas & Electric Company purchase such materials from Wisconsin Electric Power Company, at cost to that company plus a small percentage for handling charge.

During the twelve months ending June 30, 1940, the total sales to Wisconsin Michigan Power Company amounted to about five thousand dollars, and the sales to Wisconsin Gas & Electric Company amounted to slightly over forty-nine 3488
thousand dollars.

These sales included such material as wire cable, line hardware, and stationery, as well as a few transformers. The amounts of stock materials transferred under this arrangement varies from year to year.

I might add at this point that all the inter-company services which are rendered by the companies of the Wisconsin Michigan group to each other are billed at actual cost, including direct labor and materials, with reasonable overheads, and also including proper fixed charges on the investment in property and facilities utilized. 3489

In none of these arrangements is there any element of profit involved.

Q. Returning again for a moment to the operation of

—1,604—

the generating system of Wisconsin Electric Power Company, will you tell us how that system is operated, functionally, from the standpoint of personnel? A. The power plants of Wisconsin Electric Power Company are operated

3490 *Edward H. Schmidtman—By Respondents—Direct*

by personnel of what is known as the power plant department.

This department is under the direct supervision of the Chief Engineer of Power Plants and is one of the departments reporting to the vice president in charge of power.

The maintenance work in the boiler plant and turbine rooms is also done by the power plant department, but the maintenance of electrical equipment in power plants, as well as electrical equipment in power plant switch houses
3491 is done by the station operation division of the electrical distribution department.

This department is supervised by the chief electrical engineer, who also reports to the vice president in charge of power.

All electrical construction of the company is done by the station construction division of the electric distribution department.

Q. You do your own electrical construction work? A. Yes, we do. The electrical engineering is carried out by the
3492 electrical engineering division of the electrical distribution department.

—1,605—

It will be observed that all these divisions, that have to do with the operation and electrical construction of power plants, report, through their various supervisors, to the vice president in charge of power.

While electrical construction in power plants is done by the company, some of the structural work is done under outside contract.

3493

The transmission and distribution system is maintained by four overhead construction divisions of the electrical distribution department.

These divisions also do the construction work on the transmission and distribution system.

One of the divisions is located in Milwaukee and covers the Milwaukee metropolitan area.

Another division is at Racine; another, known as the Delafield division, covers the northern and western portion of the territory served by Wisconsin Electric Power Company; and the Hales Corners division covers the southwesterly portion of the territory.

3494

The work done by the four overhead divisions includes construction and maintenance work on all the transmission and distribution lines of the company as well as work on customers' premises, that has to be done in the operation of the distribution system.

Underground maintenance and construction work on the

—1,606—

transmission and distribution systems is done entirely by the underground division of the electric distribution department.

3495

Equipment in sub-stations, including both transmission and distribution sub-stations, is operated and maintained by the station operation division, which is the division that also maintains electrical equipment in power plants and in power plant switch houses.

Q. What department handles such matters as trouble service? A. Trouble service is rendered by what we call the trouble division of the electric distribution department. Customers' trouble reports, which come in, in the conduct of

the company's business, are studied by a group of men representing the management, the sales department, the electrical engineering department—I should say, the electric distribution department—and the customers' accounting department.

This committee is known as the service committee and its purpose is to study the nature of all customers troubles reported to the company, and to eliminate their causes.

The report of the service committee shows that, in the twelve months ended July 31, 1940, 33,775 customers' elec-
3497 tric service trouble reports were handled by the electric distribution department.

An indication of the general nature of these trouble re—1,607—

ports is given by the fact that, of this number, nearly 30,100 were due to trouble on customers' equipment on customers' property, and had nothing whatever to do with the Company's transmission and distribution facilities.

Q. Now, how are the load dispatching operations conducted? A. The load dispatchers direct the operation of the transmission systems.

3498 Wisconsin Electric Power Company dispatchers direct the transmission operations of both Wisconsin Electric Power Company and Wisconsin Gas & Electric Company, the latter company having no dispatchers of its own.

Wisconsin Michigan Power Company has its own dispatchers who direct the transmission of energy on the system of that company and coordinate their transmission operations with those of Wisconsin Electric Power Company.

Q. Where are the load dispatchers located? A. The load dispatchers of Wisconsin Electric Power Company are located in Milwaukee, in the Public Service Building, and

those at Appleton are located in the Appleton power plant—those of Wisconsin Michigan Power Company.

The load dispatchers, in carrying out their operations, estimate system loads from six to twelve hours in advance, under ordinary operating conditions, depending upon the season, the weather conditions, and industrial activity.

—1,608—

For week-ends and over holidays, load plans for twenty-hour intervals or so are made by the load dispatchers. These dispatchers assign loads to the various plants. That is, they 3500
determine in advance what portion of the estimated load for the day shall be carried at each station.

The load having been assigned to the respective plants, the power plant switchboard operators, who are the operating supervisors of the power plants, decide which generating unit shall be used in carrying the loads assigned to their plants.

In making this selection, they follow a standard schedule developed by the power plant department engineers, varying, according to the total load on the plant and the 3501
units available for service.

This standard schedule has been worked out so as to utilize at all times the most efficient units available. An hourly check is made by the load dispatchers on the demands being carried on all 132,000-volt lines, and also on all other lines operating between power plant or other sources of supply.

Q. How is that check made? A. The check is made by reading the meters at the sub-stations, through which these lines operate, and the purpose of the check is to make sure

that the loads being transmitted over the various circuits do not become too high and exceed the reasonable operating

—1,609—

capacity of the circuits.

Q. That check continues day and night, does it? A. Yes, every hour.

Q. Does the work of the load dispatcher become particularly important in the event of emergencies? A. Yes. The load dispatcher is extremely important in cases of emergencies on the power system.

3503

Spinning reserve is maintained in the plants of the Company sufficient to replace the largest unit carrying load during the hours from 7:00 a. m. to 9:00 p. m. on week days.

By "spinning reserve" I mean generating capacity which is actually operating but not carrying load, so that the units are up to speed and the turbines are hot and the units are ready to pick up load without any interruption, in case the largest unit then carrying load should go out of service.

In case of a forced outage of a plant or of a major generating unit, the load dispatchers immediately redistribute the load on the system among the plants or units still remaining in service, so as to utilize that spinning reserve.

3504

If additional generating capacity is needed, as would be the case if more than the largest unit on the system went out of service, additional capacity is ordered into operation by the power plant switchboard operator.

—1,610—

The dispatcher orders the switching of lines during an emergency in order to accomplish several things. The first one is to maintain continuity of service to the customers. The

second one is to minimize overloads on the lines, so as to prevent successive failures.

That is, if the load on the system is shifted in such a way that a certain circuit is loaded more heavily than it should be, the circuit breakers, which protect that circuit from overload, will operate and throw the circuit out of service.

That, of course, would create a further and more serious situation, and so the dispatchers are very careful to keep loads on lines within reasonable carrying capacities at 3506 times of emergency switching.

A third point which the dispatchers accomplish is to transfer the load on the various sub-stations in order to accommodate the emergency load conditions and prevent excessive overloads on the sub-stations, just as they do on the respective transmission circuits.

Then they also switch so as to re-establish service, if any load has been dropped during the emergency, such re-establishment being effected after additional generating capacity has been brought into service.

Many of the line outages on the systems of the companies 3507 don't require load to be dropped, but, in case it is dropped,

it is restored just as quickly as it can be without throwing other load out of service.

Q. I believe you stated that the work of the load dispatchers on the systems of Wisconsin Michigan Power Company and Wisconsin Electric Power Company were coordinated. Will you explain further the manner in which that coordination is maintained? A. That coordination can be

illustrated by describing the dispatching operations that take place when Wisconsin Michigan Power Company desires to deliver dump hydro-electric energy to Wisconsin Electric Power Company.

Under such conditions the Wisconsin Michigan Power Company load dispatcher notifies the load dispatcher of Wisconsin Electric Power Company by telephone that dump hydro-electric energy is available at Appleton.

He also states how many kilowatts of such power can be
3509 taken and for what period of time it can be furnished.

Wisconsin Electric Power Company dispatcher accepts the delivery of hydro-electric energy, if the loads on the system are such that that energy can be absorbed and the demands on the steam generating stations are readjusted in order to accommodate the delivery of the hydro-electric power from Appleton.

The delivery is continued until such time as Wisconsin Michigan Power Company finds that water conditions make it necessary to discontinue delivery.

—1,612—

3510 That may be after a period of a few hours, or it may be after a period of several days, depending upon stream-flow conditions.

When that time is reached, Wisconsin Michigan Power Company's load dispatcher again telephones that they will be ready to discontinue delivery at a certain time.

Upon receiving that notice, the dispatcher of Wisconsin Electric Power Company arranges to have the load, which will be dropped at Appleton, picked up by the steam power plants on the system that he is dispatching.

In case Wisconsin Michigan Power Company is in need of dump steam energy, by the use of which it desires to conserve water in its hydro-electric plant ponds, the Wisconsin Michigan Power Company dispatcher will call Wisconsin Electric Power Company dispatcher and request the delivery of the dump steam power.

If the loads on the plants of Wisconsin Electric Power Company are such as to make dump steam power available at the time, the dispatcher at Milwaukee will approve, and the capacity to be delivered and the time of delivery will be 3512 agreed upon by the two dispatchers.

When that time comes the Wisconsin Electric Power Company load dispatcher will order the plants of his company to pick up the amount of load represented by the dump steam deliveries to Wisconsin Michigan Power Company, —1,613— and the plants begin delivering that energy.

Delivery is continued until Wisconsin Michigan Power Company dispatcher again telephones and notifies the dispatcher of Wisconsin Electric Power Company that they 3513 wish the delivery of dump steam power to stop, and at that time the plants of Wisconsin Electric Power Company drop the load.

When that load is dropped, the plants of Wisconsin Michigan Power Company pick it up and begin generating energy by using the water that they have stored during the period of delivery of dump steam power from Milwaukee.

Q. The principal office of Wisconsin Electric is at the Public Service Building in Milwaukee, is it not? A. Yes, it is.

3514 *Edward H. Schmidtman—By Respondents—Direct*

Q. And what other company offices does Wisconsin Electric have? A. Wisconsin Electric Power Company maintains other company offices at Port Washington, West Allis, Cudahy, South Milwaukee, and Racine.

These offices are maintained at these points for the convenience of the customers, in carrying out their transactions with the Company.

At these offices, Company representatives receive applications for service and receive reports of customers' trouble,

3515 —1,614—

whether that be of a type relating to outage of service or trouble with appliances or other electrical equipment, or whether it be a complaint on a bill which seems too high, or any other type of customers' trouble report. They are all received at the Company offices and are reported to the proper departments for handling.

Q. In addition to the Company offices, does Wisconsin Electric Power Company maintain local agents throughout its territory? A. Yes, it does.

Q. And where are they located? A. There are nine alto-

3516 gether, located in the following communities:

Oconomowoc, Delafield, Pewaukee, South Milwaukee, Waterford, East Troy, Port Washington, Muskego Center, and Hartland.

In addition to these nine regular local agents, the Company also has three relief agents, who relieve the regular men during their weekly days off, and one relief local agent, who serves in all of the local agents' territories during the vacation season.

Q. What is the function of the local agent? A. The local agent's function is to maintain service on the Com-

pany's system within his territory, to the greatest extent possible for one man, and to also represent the Company in

—1,615—

all contacts with the customers.

The local agents of Wisconsin Electric Power Company receive applications for service. They render trouble service on the distribution system, within the capacity of one man.

There are certain types of trouble which one man can't remedy, such as would be caused by a heavy storm, with trees falling over the lines. 3518

When there is an outage on the system the local agent sees to it that the situation is made as safe as possible for the public; that is the first thing he does. If it is necessary to do certain switching operations to kill a certain circuit, he will do that.

Then, if it is possible for him to repair the break, he will do it; if it isn't, he calls the division office and has repair crews sent out to restore service.

The local agents also render trouble service on customers' premises, making temporary repairs to equipment and to wiring, and disconnecting defective equipment which he is 3519 unable to repair himself.

They replace heating elements in electric ranges and make various appliance repairs.

Repairs of this kind, such as I have just mentioned, are not made by the trouble division of Wisconsin Electric Power Company; they are made entirely by the local agents, and, if

—1,616—

the local agent can't handle the repairs, as a matter of convenience for the customer, he will refer the situation to some local electrical repair man or electrical dealer.

Our local agents cut off service upon order, and also reconnect service upon order.

They make special meter readings. It isn't the function of the local agents to read meters directly or regularly, but in cases where the regular meter reader has been unable to take a reading, because of locked premises or some other circumstance, word will be left with the local agent and he will make the reading at his earliest opportunity.

The local agents also make the initial reading of a meter
3521 when service is first furnished to a customer, and the meter is first installed.

When service is disconnected, the local agent will take the final reading from the meter.

The local agents of Wisconsin Electric Power Company also collect delinquent bills for the accounting department. Bill collection is not one of their regular functions—that is, they don't go from house to house for the purpose of collecting electric service bills.

They will receive payment of bills at their offices, which, in many instances, are at their residences, but the only bills
3522 which they do collect by calling on the customer are delinquent accounts, submitted to them by the accounting depart-

—1,617—

ment of the Company.

Each local agent is instructed to call the Milwaukee office two to three times daily, in order that there may be passed on to him any calls made at the office, for service, from customers within his district.

Many such calls come to the offices in the Public Service Building, from people living in the city and suburbs, who have cottages in the resort areas in the outlying districts.

3523

They call at the main office, saying that they are planning to go to their cottages for certain periods and desire to have service reconnected.

Q. In the conduct of the business, I assume a certain number of collection agencies are necessary. A. Yes, they are necessary. The Wisconsin Electric Power Company maintains a total of 257 collection agencies in the electric service territory it serves; 218 of these are in Milwaukee and immediate suburbs; five are in the city of Port Washington; and 34 are located in 31 different rural communities.

3524

Q. These are points at which customers may make payment of bills? A. Yes. They may make payment of bills and these collection agencies will also take messages for the Company although they do not accept applications for service and do not render other service to the customer, ordinarily, other than that of accepting payment of bills.

—1,618—

Q. That is a rather large number of points at which payments may be made. Is there any particular reason for that? A. The reason for maintaining so many collection agencies is that we want to make it convenient for customers to pay their bills.

3525

Q. And in general what are these points at which payments may be made? A. Where are the points, did you say?

Q. Not "where", but "what" are the points? A. Oh. These collection agencies commonly are in stores or banks or shops of various kinds, located in the communities—places which are open for business relatively long hours of the day, and—well, the point being that we are trying to make it easy for the customers to pay their bills, not only

because we desire to accomplish prompt payment, but, if a customer finds it difficult to pay his bill he will have grounds for complaint on the quality of service.

It is just one of the elements, in serving the people—getting the service to them and making it convenient for them to pay for it.

Q. Where are the principal offices of Wisconsin Gas & Electric Company? A. The principal offices of Wisconsin

—1,619—

3527 Gas & Electric Company are located in Racine, Kenosha, Fort Atkinson, and West Bend.

These offices are the central offices of the four operating divisions of the Company, known as the Racine Division, the Kenosha Division, the Western Division, and the Northern Division, respectively.

Q. And does Wisconsin Gas & Electric Company similarly maintain local agents throughout its territory? A. Yes, it does. Wisconsin Gas & Electric Company has local agents at Union Grove, at Franksville, at Wilmot, at Palmyra, at Johnson's Creek, at Reedsville, at Thiensville,

3528 at Random Lake, at Menomonee Falls, at Lomira, at Elkhart Lake, and at West Bend.

Most of these communities are shown on Exhibit 32.

Q. And is the function of these local agents, in general, the same as the function of the local agents of Wisconsin Electric Power Company? A. Yes, it is, in general. There may be slight variations in some of the detailed duties they perform, but generally they are very much the same.

There is one major respect, however, in which the operation of the system of Wisconsin Gas & Electric Company

3529

differs from the manner of operation of the system of Wisconsin Electric Power Company. —1,620—

That difference arises from the fact that Wisconsin Electric Power Company has an organization which is functional in nature—that is, certain functions are performed over the entire system by certain organizational groups, whereas, in the case of Wisconsin Gas & Electric Company, the organization is set up on a divisional basis, so that all operating functions within a given division or territory are performed by one organization.

3530

Q. Would you say that the reason for that segregation is the greater extent of the territory of the Wisconsin Gas & Electric Company? A. Yes, that is the reason. The greater extent of the territory makes the divisional type of operation much more economical.

It reduces traveling that would be required if one division or department were assigned the task of performing certain functions over the entire wide-spread territory.

Q. Where is the principal office of Wisconsin Michigan Power Company located? A. The principal office of Wisconsin Michigan Power Company is located in the city of Appleton, but the Company also maintains divisional offices in Iron Mountain, Michigan, and Neenah and Weyauwega, Wisconsin. All of these cities are shown on Exhibit 32.

3531

Q. And does it employ counterparts of the local agents

—1,621—

that perform services for the other two companies? A. Yes, it does. It doesn't call them local agents; it calls them district men, but the functions of these district men, on the system of Wisconsin Michigan Power Company, are very

3532 *Edward H. Schmidtman—By Respondents—Direct*

much the same as that of the local agents on the systems of the other two companies in the group.

Wisconsin Michigan Power Company is also organized along divisional lines, the Northern Division having its main office in Iron Mountain, and the Southern Division having its main office in Appleton.

There are eight district men in the Northern Division, most of whom have their offices in their residences, and eighteen collection agencies in the Northern Division as well.

3533 Q. Will you locate the points at which the so-called district men operate? A. Yes. The district men are located at Powers, Loretto, Cooks, Perkins, Champion, Iron River, Paynesville, and Phelps, Wisconsin.

These are the eight district men's locations in the Northern Division.

In the Southern Division, the seven district men are located at the communities of Gillett, Bonduel, Bear Creek, Seymour, Weyauwega, Hortonville, and Hilbert.

In addition to these seven district men, Wisconsin Michigan Power Company maintains 35 collection agencies

3534 —1,622—

in the Southern Division.

Q. Again from the standpoint of operating personnel, how are the functions of operating the power plant system, the transmission and distribution line systems, distributed within the organization or Wisconsin Michigan Power Company? A. The power plants of Wisconsin Michigan Power Company are operated and maintained by personnel which are a part of the engineering division of the Company, under the supervision of the chief engineer.

3535

Maintenance work in the Appleton steam power plant is performed by special maintenance crews, and, in the hydro-electric power plants, it is done by the plant operators, except when the magnitude or nature of the maintenance operation requires additional men.

In such cases, the additional help is brought in from other divisions or from outside the Company.

Assistance from outside the Company is commonly used when the maintenance operations involve such special tasks as electrical welding and other highly specialized occupations.

3536

The power plant sub-stations are ordinarily maintained by the crews that operate the power plants themselves. The divisional forces are sometimes used for this work, when the power plant personnel are not available and divisional per-

—1,623—

sonnel are.

The transmission and distribution line and sub-station construction is done by divisional forces under the direction of the division managers.

The maintenance work on transmission and distribution lines and sub-stations is also done by these same people.

3537

In the case of Wisconsin Michigan Power Company, the organization is arranged on a combination of the functional and divisional basis.

This arrangement of operating personnel has been found most effective and most economical in carrying out the operations of the Company in the area where it serves.

Q. With respect to operating expenses, what has been the record of the electric utilities constituting the so-called Wisconsin Michigan group? A. The operating expenses per kilowatt hour of the companies in the Wisconsin Michigan

3538 *Edward H. Schmidtman—By Respondents—Direct*

Group, excluding depreciation and taxes, have been greatly reduced in recent years. In the case of Wisconsin Michigan Power Company, such expenses amounted to 40 one-hundredths of a cent per kilowatt hour of net output in 1927.

By 1939 this had been reduced to 35 one-hundredths of a cent.

By "net output", I mean the total of all energy delivered to the system from all power sources, including net

—1,624—

3539 generation and net purchases.

Now, this reduction of operating expenses, during a twelve-year period, is undoubtedly somewhat less than would be found if comparison were made over a longer period of time.

(Discussion off the record.)

A. (Continuing) It has been impossible to use a longer period of time in this comparison, however, because the records of the Company do not extend beyond 1927, with respect to the small systems acquired and merged at that time.

3540 In 1920, the operating expenses of Wisconsin Gas & Electric Company, excluding taxes and depreciation, amounted to 2.36 cents per kilowatt hour of net output.

In 1939, they were 1.33 cents per kilowatt hour.

For Wisconsin Electric Power Company, the operating expenses, exclusive of taxes and depreciation, in 1920, were 1.83 cents per kilowatt hour, and, by 1939, this had been reduced to only 58 hundredths of a cent per kilowatt hour of net output.

Mr. Hamilton: May this chart be marked as Respondents' Exhibit No. 35, for identification?

The Examiner: Yes, sir.

(The document referred to was marked as Exhibit No. 35 for identification.)

—1,625—

By Mr. Hamilton:

Q. Will you state, Mr. Schmidtman, what Respondents' Exhibit No. 35 for identification purports to portray? A. Exhibit No. 35 is a chart showing the trend of operating expenses of Wisconsin Michigan Power Company for the—— 3542

Q. (Interposing) Of what company? A. Wisconsin Electric Power Company.

(Continuing)—for the period 1920 to 1939, inclusive.

Q. And has this chart been prepared under your supervision? A. Yes, it has.

Q. The facts shown have been taken from the records of Wisconsin Electric Power Company? A. Yes, they were.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 35.

Miss Calkins: No objection.

3543

The Examiner: The chart is received under the number assigned to it.

(The document referred to was received in evidence as Respondents' Exhibit No. 35.)

By Mr. Hamilton:

Q. In the operation of these three electric utility properties, is power production expense a major component of

—1,626—

total operating costs? A. Yes, it is, and that fact is shown

by the relative positions of the two curves shown in Exhibit 35, the solid curve showing total operating expenses, excluding taxes and depreciation, and the dotted curve showing the power production expense alone.

Q. Now, in order to make clear the points on the chart covered by the curve, can you state from the chart the cost per kilowatt hour of net output to Wisconsin Electric Power Company in 1920, stating, in the first instance, power production expense? A. In 1920, the power production ex-
3545 pense of Wisconsin Electric Power Company, as indicated by the chart, was about 1.22 cents per kilowatt hour of net output.

Q. And the comparable figure, if you will, for 1939? A. The comparable figure for 1939 is slightly over .31 cents per kilowatt hour.

Mr. Hamilton: Will you read that answer back again, please?

(Last answer read by the reporter.)

By Mr. Hamilton:

3546 Q. Now, if you will, like information as to total operating expense as shown on the chart, excluding taxes and depreciation, for the years 1920 and 1939? A. The total operating expense, excluding taxes and depreciation, of

Wisconsin Electric Power Company, for the year 1920, was 1.83 cents per kilowatt hour of net output, and for 1939 was .58 cents per kilowatt hour.

Q. Now, you stated, I think, that power production was a major component of operating costs, and referred to the chart in that connection.

3547

Will you give us a little more in detail on that observation? A. The fact that power production expense constitutes a major portion of total operating expenses accounts for the major portion of the difference between the total operating expenses of the three companies in the Wisconsin-Michigan group.

In 1939, Wisconsin Michigan Power Company, which had a total operating expense, excluding taxes and depreciation, of 35 hundredths of a cent per kilowatt hour of net output, had power production expenses of only 17 one-hundredths 3548
of a cent per kilowatt hour.

The reason for this low power production cost lies in the fact that the power generation of Wisconsin Michigan Power Company is largely by means of hydro-electric generating stations.

In the operation of such hydro-electric generating stations, there is little opportunity for reducing production expenses, inasmuch as actual operating expenses are low and

are relatively constant, almost regardless of the output of 3549
the plants.

The expense per kilowatt hour varies almost inversely with the output, which in turn depends very largely upon stream-flow conditions.

In years of high run-off, within the capacity of the wheels of the plants, hydro-electric output is high and the production expense per kilowatt hour of such output is low.

Another reason why the total production expense in such years is low is that less steam make-up power is required in carrying the loads of the system, again resulting in lower power production expenditures.

3550 In years in which the flow available for hydro-electric generation is low, the hydro-electric output is down and the production expense in hydro-electric plants, per unit of output, is up.

Similarly, the amount of steam power required in such years is higher and the cost of such power adds to total production expenses, and raises the total unit production expense for the entire company.

As a result, production expenses of Wisconsin Michigan
3551 Power Company are affected more by water conditions than they are by operating economies, and it was for that reason that the production expenses and operating expenses of Wisconsin Michigan Power Company have not been shown in the exhibit, because they would not be indicative of any

trend toward economies in operating costs.

In the case of Wisconsin Gas & Electric Company, total power costs per net kilowatt hour were 87 hundredths of a cent in 1939.

As previously explained, Wisconsin Gas & Electric Com-
3552 pany purchases almost its entire power requirements from Wisconsin Electric Power Company.

The rate which it pays for such power includes production expenses, as well as fixed charges on facilities utilized in generating the energy and delivering it to the system of Wisconsin Gas & Electric Company.

Although Wisconsin Electric Power Company passes on to Wisconsin Gas & Electric Company the benefit of savings it has accomplished in lowering power production expenses, the rate which must be charged for this service must neces-

sarily continue to include fixed charges on investment in facilities, and, for that reason, no great change would appear in the power costs of Wisconsin Gas & Electric Company, and there is very little opportunity for that company to develop any appreciable economies in its power production expense.

In the case of Wisconsin Electric Power Company, however, there is more opportunity, which has been taken advantage of in the operations of the Company.

—1,630— 3554

In 1939, the total operating expense was 58 hundredths of a cent per kilowatt hour.

Advantage which has been taken by this Company of possible economies in power generation is shown by the rate at which the power production cost curve in Exhibit 35 has fallen during the period indicated.

These curves show that a major portion of the total saving—or, rather, the total reduction in all operating expense —was achieved through the reduction in power production expense.

In 1920, power production expenses constituted 67 per 3555
cent. of total operating expenses shown in Exhibit 35. In 1939, they constituted 53 per cent. of the total operating expenses.

During the 19-year period covered by Exhibit 35, the total operating expenses per kilowatt hour of net output were reduced by 68 per cent., and the production expense per kilowatt hour of net output was reduced by 75 per cent.

Other expenses than power production expense were 61 per cent. of the total in 1920, and—no, I have become confused here.

3556 Other operating expenses than power production expense were 61 hundredths of a cent per kilowatt hour in 1920, and were 27 one-hundredths of a cent per kilowatt hour in 1939, this change representing a reduction of 56 per cent. in expenses other than power production.

—1,631—

Q. Will you explain the reasons for this rather sharp decline in power production expense in the period indicated on Exhibit No. 35? A. The reason for the marked reduc-
3557 tion in power production expenses of Wisconsin Electric Power Company, during the period shown, lies in the important improvements in the design and operation of steam power plants which were developed by Wisconsin Electric Power Company.

The average heat consumption of the plants of the Company was 37,332 B. t. u. per kilowatt hour of net output in 1920, and 13,674 B. t. u. per kilowatt hour of net output in the year 1939.

—1,632—

3558 As a result of this saving, electrical energy was produced in 1939 at a heat consumption of only about one-third of that per unit of output that occurred twenty years ago.

Inasmuch as fuel is a major item of expense, this improvement in thermal efficiency of steam generating stations has been a very important element in the reduction of power production expenses of the company.

The Examiner: Let us have a recess of five minutes.

(Whereupon a short recess was taken.)

3559

By Mr. Hamilton:

Q. Had you finished your statement, Mr. Schmidtman? A. Not quite. I just stated that inasmuch as fuel is a major item of expense in the power production of Wisconsin Electric Power Company, the improvement in thermal efficiency was an important factor in reducing production costs.

To indicate the extent to which fuel is a major item of expense, I have some data here on the fuel consumption at the Lakeside plant and the Port Washington plant in 1939.

3560

The Lakeside plant burns midwestern screenings which are brought in by rail. During the year 1939, the average heat content of the coal burned at that plant was 11,459 B. t. u. per pound. The plant burned 527,791 tons, which

—1,633—

cost an average of $3.68 a ton.

The average fuel cost for the year was .231 cents per kilowatt hour of net output.

Q. That is at Lakeside, is it? A. That is at Lakeside. Coal is brought to the Port Washington plant by means of coal boats on Lake Michigan. The coal burned at that plant consists of eastern screenings and in 1939 the coal consumed had an average heat content of 12,997 B. t. u. per pound, which is slightly higher than the heat content of the coal burned in the Lakeside plant. 162,166 tons were burned during the year and cost an average of $4.22 a ton.

3561

The average coal consumption, or rather the average coal cost per kilowatt hour of net output at the Port Washington plant was .175 cents per kilowatt hour.

In view of the fact that a substantial portion of the company's generation is produced at the Lakeside plant, and that

3562 *Edward H. Schmidtman—By Respondents—Direct*

the coal costs per kilowatt hour at that plant was .231 cents per kilowatt hour of net output, it may be seen that coal represents somewhere in the neighborhood of 70 per cent. of the total production cost of the company.

I stated in answer to a question off the record, that the coal costs experienced by Wisconsin Electric Power Company were relatively high and that those high costs justified the heat-saving developments which have been made by the

—1,634—

3563 company in building and operating these power plants.

Mr. Hamilton: May that chart be marked as Respondents' Exhibit No. 36 for identification?

The Examiner: Yes.

(The chart referred to was marked for identification as Respondents' Exhibit No. 36.)

By Mr. Hamilton:

Q. Will you explain what Respondents' Exhibit No. 36 for identification portrays? A. Respondents' Exhibit No. 36

3564 is a chart showing the average annual heat consumption of all the power plants of Wisconsin Electric Power Company in B. t. u. per net kilowatt hour of output for the years 1920 to 1939, inclusive, and for a portion of the year 1940.

Q. Has this chart been prepared under your supervision? A. Yes, it has.

Q. And the facts shown have been taken from the records of Wisconsin Electric Power Company? A. They were.

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 36.

3565

Miss Calkins: No objection.

The Examiner: It is so admitted under the number mentioned.

—1,635—

(The chart referred to was received in evidence as Respondents' Exhibit No. 36.)

By Mr. Hamilton:

Q. Does the curve get into 1940, Mr. Schmidtman? A. Yes, it does. The short projection to the right of the vertical line which lies midway between the lines designated as 1938 and as 1940 extends into the year 1940.

3566

Q. Now, in order to make clear what generating plants are comprehended in this information, would you state them merely by name? A. Yes. The data on this chart include all the steam power plants operated by Wisconsin Electric Power Company in each of the respective years shown on the chart. For the years prior to 1935 the chart covers—I must start that answer over.

For the year 1920, the chart covers the Commerce Street, Oneida Street and Racine plants of the Wisconsin Electric Power Company.

3567

For the years 1921 to 1935, it includes the Lakeside, Commerce Street, Oneida Street and Racine plants of Wisconsin Electric Power Company.

Q. It does not include East Wells Street? A. That was the Oneida Street plant during those years.

For the years 1936 to the end of the chart it covers the Lakeside, Commerce Street, East Wells Street, Port Wash-

—1,636—

ington and Racine Plants.

3568 *Edward H. Schmidtman—By Respondents—Direct*

The height of the curve at any line designated as a year represents the average heat consumption in British Thermal Units per net kilowatt hour of output for all of the plants operated during that year by Wisconsin Electric Power Company.

Q. Now, will you explain the reasons for the rather sharp decline indicated by the curve in the years 1920 to 1922? A. The curve begins in the year 1920 prior to the time of construction of the Lakeside power plant. The reductions
3569 shown in the year 1921 and in 1922 came about through the efficiency of the Lakeside power plant.

The initial thermal efficiency of the Lakeside plant, although not as high as it became later, was still sufficiently high to lower the over-all heat consumption of the system as a whole, so that by the end of 1921, the average heat consumption for the company's power plants had been lowered to 28,825 B. t. u. per kilowatt hour.

The further reduction in 1922 and in 1923 came about from the higher efficiencies resulting from improved operations of the equipment in the Lakeside plant.
3570

It will be observed that the curve had begun leveling off by the end of 1923, indicating that the equipment then installed was being operated at about its best efficiency.

Q. And then, subsequent to 1923, another rather sharp

—1,637—

drop appears on the curve. To what is that attributed? A. That sharp drop comes about from the increased efficiency resulting from the radiant super-heaters installed in boiler number 2 after 1923.

By the end of 1923 the capacity of the plant had reached 70,000 kilowatts, which utilized the full steaming capacity of boiler room number 1.

Q. You are referring still to Lakeside, are you not? A. Yes, I am referring to the Lakeside plant. Boiler room number 2, however, went into service after 1923, utilizing the radiant super-heaters, resulting in a sharp reduction of heat consumption.

Operating methods were further improved on the new equipment in 1924 and in 1925 and the curve began again 3572
leveling off in 1926 and 1927.

Q. Has the use of high steam pressure resulted in economies in operation of the generating stations of Wisconsin Electric? A. Yes, it has, and that economy is shown by the continued decline of the curve in Exhibit 36 after the years 1926 and 1927.

High pressures were first adopted at the Lakeside plant in 1926 and were in operation during the year 1927. As I have previously explained, the operation of this high pressure equipment didn't reach its maximum effieiency until after 3573

certain difficulties had been eliminated, but after that had been done, the heat consumption of the Lakeside plant and of the average for the system, as a whole, resumed its downward trend.

The present capacity of the Lakeside plant was reached in 1930, but the average economy continued to improve until 1933. This continued improvement in economy at the Lakeside plant which is reflected by the downward trend of the curve in Exhibit 36, came about because of decreasing loads

3574 *Edward H. Schmidtman—By Respondents—Direct*

on the plant making it possible to carry increasing portions on the high pressure equipment, as I have previously explained.

In 1929 only 23.8 per cent. of the load on the Lakeside plant was carried on the high pressure equipment, resulting in a heat consumption of 14,882 B. t. u. per kilowatt hour of net output.

In 1933, 85.6 per cent. of the output of the Lakeside power plant was generated by means of the 1,230 pound cycle, re-
3575 ducing the heat consumption of the Lakeside plant to 13,302 B. t. u. per kilowatt hour.

That point is marked by the dip in the curve in Exhibit 36 on the line representing the year 1933.

Following 1932, an improvement in business occurred and demands on the power plants of the companies increased. As a result of these increased demands for service, heavier

—1,639—

loads were placed on the low pressure equipment in the Lakeside plant, the high pressure equipment being utilized almost fully at that time.

3576 As a result of putting additional load on the low pressure equipment, the heat consumption of the plant went up, causing an increase in the heat consumption of the system as a whole.

From 1934 to 1935, a slight decrease in heat consumption occurred which became somewhat sharper in 1936 due to the operation of the Port Washington power plant which went into operation at the end of the year 1935.

In order to accomplish maximum over-all economy, the Port Washington plant is operated as a base load plant and

the Lakeside station carries the load fluctuations. This type of operation caused increased heat consumption at the Lakeside plant which is now operating at an average economy of about 14,500 B. t. u. per net kilowatt hour.

This increase in heat consumption at Lakeside, however, is more than offset by the reduced consumption at Port Washington, lowering the total for all plants of the company to 13,674 B. t. u. in 1939.

The power plant department of the company which has 3578
carried out the design and analyses of all power plant equipment installed by the company, has estimated that a saving of about one and a half million dollars has been realized at

—1,640—

the Lakeside plant up to the end of 1939 through the use of the 1,200 pound equipment.

This estimate is based upon the investment and the economy of low pressure equipment and high pressure equipment already in service in the plant; that is, the cost of operating the plant on the basis of low pressure equipment entirely has been estimated in terms of the cost of operating the low 3579
pressure equipment that is actually in the plant, and the savings which have been realized are measured by the operating costs actually experienced in comparison with that estimated on the basis of all low pressure generation.

The total fuel saving is estimated at $2,530,000.00.

Now, offset against this total saving, however, are increased fixed charges of about $1,000,000.00 in the higher investment required for the high pressure equipment.

The difference between those figures leaves the net estimated saving of one million and a half dollars between the

3580 *Edward H. Schmidtman—By Respondents—Direct*

years 1926, when the first high pressure equipment went into service, and the end of 1939.

Q. Has the installation of the new unit at East Wells Street had any effect on the curve? A. Yes, it has. The average heat consumption of the East Wells Street unit in 1939 was 13,128 B. t. u. per kilowatt hour of net output.

—1,641—

Since that is below the average for the power plants of the company as a whole, it may be seen that it has operated
3581 to bring down the average for the company.

I have previously stated that a saving of about $130,000 has been realized through the operation of the East Wells Street plant during the twelve months ended February, 1940, this saving being the difference between the costs actually experienced in producing the electrical and steam output of the plant and the cost of producing similar output in the old Oneida Street boilers and in other power plants of the company.

During that twelve months period, the plant was out of operation for more than two months and it is believed that
3582 if it had been operating for the full twelve months period, the saving would have been even greater than the one we have estimated.

The new boiler and turbo-generator unit being installed at Commerce Street are expected to show savings of the same general order as those shown by the East Wells Street unit. The estimated cost of the electrical energy to be generated in the new Commerce Street unit is .3 of a cent per kilowatt hour and it is estimated that steam for heating purposes will cost not over 22 cents per thousand pounds.

Edward H. Schmidtman—By Respondents—Direct 3583

In operating the power plants of the three companies, to achieve maximum over-all economy, it should be stated that economy alone is not the sole consideration.

—1,642—

For the purposes of economy only, most of the load of Wisconsin Electric Power Company would be carried on the Lakeside and Port Washington plants only, but in order to make additional generating capacity available to guarantee continuity of service to our customers, the Commerce Street plant, as now constituted, and the Racine plant, are operated on schedules which make their capacity available to the system as a whole. 3584

After the new unit goes into service in Commerce Street, that plant will probably deliver more output to the system than it has done in recent years because of the greater efficiency of the new unit.

Likewise, East Wells Street plant will carry increasing portions of the system load because of its efficiency as well as because of the location of the East Wells Street plant and the Commerce Street plant in the heart of the downtown district. 3585

Location of a power plant in the immediate proximity of the load it serves is desirable, inasmuch as it eliminates the hazards of the transmission line outages attending location of power plants some distance from their loads.

Q. Have plans been laid for the construction of a new unit at Port Washington? A. Yes, they have. The plans have been laid and construction is now actually under way

—1,643—

for the installation of a second 80,000 kilowatt unit in the Port Washington Plant.

3586 *Edward H. Schmidtman—By Respondents—Direct*

Contracts for the major generating equipment have been let and the construction schedule calls for completion by the fall of 1942, but permits of speeding up to the point that the unit will be made available for service sometime earlier than that, possibly in the fall or winter of 1941.

Q. Do you know the proposed steam pressure of the new unit? A. The new unit will operate at a pressure the same as that of the present unit, 1,230 pounds, and will also operate at a temperature of the same general range as the
3587 temperature at which the present unit operates.

Q. You would anticipate then, would you, that the operation of the new unit might further improve the record of the company with regard to heat consumption economy? A. Yes, it is expected that that will be one of the results of the new unit at Port Washington. The present unit has established a record which has been unequalled by any other power plant in regular operation and it is believed that the new unit embodying the improvements in steam turbine design which have been made in the last five years, will have economies possibly exceeding those in the present plant.

3588 —1,644—

Miss Calkins: Do you mean any other unit in operation by your company?

The Witness: Any other plant in the world.

Miss Calkins: Any other plant in the world?

The Witness: Yes.

By Mr. Hamilton:

Q. Before leaving Respondents' Exhibit No. 36, would you state the date at which the curve terminates? Does it include six months in 1940?

The Witness: Will you read the question, please?

(Whereupon the pending question was read by the reporter.)

The Witness: Yes, it covers six months in 1940. The ordinate, or height of the curve, at the point where it terminates, represents the average heat consumption of the five steam generating stations of Wisconsin Electric Power Company during the first six months of the year 1940. 3590

Q. You have testified previously as to the program of Wisconsin Electric in standardizing its generation of 60-cycle current. Has that program resulted in economies? A. Yes, it has. It has resulted in generating economies as well as economies arising from the simplification of the operation of the distribution system.

At various times during its period of operation, the Commerce Street power plant has furnished four classes of service; namely, 250-volt direct current, 600-volt direct

—1,645— 3591

current, 25-cycle alternating current and 60-cycle alternating current.

The furnishing of this many types of service is inconvenient and it is expensive. The aim of the company has been to standardize on 60-cycle service and in connection with that aim other classes of service have been reduced and 60-cycle service substituted wherever possible.

New customers in the present direct current area served by Wisconsin Electric Power Company, are being served from the alternating current network and the furnishing of

3592 *Edward H. Schmidtman—By Respondents—Direct*

service to customers in that general area is being given under an arrangement, or rather under a program, which is intended to eventually eliminate the direct current service entirely.

We consider this a step toward economical operation of both power plants and transmission and distribution systems.

Q. Have you data as to the availability for generating purposes of the high-pressure equipment at Lakeside and
3593 Port Washington? A. Yes, I have. Wisconsin Electric Power Company keeps records of the hours of operation of all the units in all its power plants. We have been particularly interested in the availability record of the high-pressure boiler and generating equipment installed in the power plant at Lakeside and Port Washington.

—1,646—

The Port Washington power plant, since the beginning of its operation, has been available the following percentages of time:

3594 In 1936, it was available 89.8 per cent. of the time.
In 1937, 86.5 per cent. of the time.
In 1938, 95 per cent. of the time, and
In 1939, 88.7 per cent. of the time.

The power plant outages which have occurred during the remaining per cent. of the time have been relatively infrequent. Most of them are scheduled.

The Port Washington power plant has been out of service very little because of unscheduled outages. The latest outage of any power plant of Wisconsin Electric Power Company

3595

occurred at the East Wells Street plant early in the spring of 1940.

I mentioned a moment ago that the plant was out of service during the twelve months ending February, 1940, and part of that period was due to this outage, resulting from a bursting super-heater tube.

When this tube burst, it was necessary to shut down the boiler and also shut down the generating unit, taking the entire plant out of service. The load being carried by the plant at the time that outage occurred was immediately picked up by other plants of the system and no interruption, whatever, of electric service resulted.

3596

—1,647—

The latest outage at the Port Washington plant occurred in the summer of 1939 when a boiler tube failed, requiring the shutdown of the complete plant.

A substantial load was being carried by the plant at that time and when that load was dropped and shifted to the other plants of the company the frequency fell off for a short period. As I recall, the record indicates that the reduction in frequency during that period was less than one cycle. That would mean a loss in speed of less than 1/60 of the speed at which the units were running.

3597

Service to any of our customers was not interrupted, however, because the spinning reserve at the other plants was sufficient to pick up the load carried on the Port Washington plant.

I previously explained that during the hours of the day in which the major loads are carried, Wisconsin Electric

Power Company maintains spinning reserve equivalent to the load being carried on the largest unit on the system.

That reserve was able to pick up the load dropped by the Port Washington unit without interrupting service to any customers.

An outage of a different type occurred on the system of the Wisconsin Electric Power Company in the fall of 1939 when an aviator flying an airplane decided to try to fly between the wires of a double circuit 132,000 volt line con-

3599 —1,648—

necting the Lakeside plant with the Racine-Kenosha area. By a stroke of providence he managed to get through all right, but he short circuited both circuits of the transmission line. The plane went on through.

(Discussion off the record.)

A. (Continuing) The short circuit on the transmission line caused the circuit breakers of the Lakeside power plant to open, interrupting service to the Racine-Kenosha area. The Racine plant was in operation at the time and by utilizing

3600 the full generating capacity of that station, as well as the full transmission capacity of the 26,400 volt circuits connecting the Lakeside plant with Racine, the company was able to carry the loads in that district until the damage to the line was repaired.

When the circuit breakers on the Lakeside end of the transmission line opened, the sudden reduction of load on the units at that plant caused a momentary increase frequency. This was quickly adjusted for by the governors and normal service continued on the rest of the company's system.

3601

The latest outage on the system of the Wisconsin Electric Power Company, which caused an interruption in service to customers, occurred on January 1, 1937, at about 1:30 a. m. The New Year's celebration was at its height when one of the cylinder heads on an engine in the Commerce Street

—1,649—

plant blew off.

The live steam escaping into the engine room caused moisture to condense on the switchboard and short circuited the switches serving certain feeders in the downtown area. 3602
It was impossible, because of the moisture in the switching room, to reestablish service through those switches, so it was reestablished by bridging the feeders at other points on the system.

For a period of two hours or more a certain portion in the downtown area was darkened.

A circumstance of that kind couldn't occur again because the switching apparatus in the plant is now being located so it will be safe from accidents of that kind.

The old engines have been largely removed and the two 3603
remaining in service are operated very seldom. It is anticipated that within the next few years the two remaining engines in the plant will be removed.

Q. Will you relate the installed generator capacity of the Wisconsin-Michigan group to the electric plant investment of the companies comprising that group? A. The total installed generator capacity in the power plants of the three companies of the Wisconsin-Michigan group, at the end of 1939, was 545,480 kilowatts.

3604 *Edward H. Schmidtman—By Respondents—Direct*

The total book value of electric plant in service of these three companies at that time was $140,315,612.00

—1,650—

Q. Now, is that before or after depreciation? A. Before depreciation. Dividing the book value by the generator capacity gives an average book figure of $257.05 per kilowatt of installed generator capacity.

This figure represents all electric plant in service of the three companies, including power plants and transmission
3605 and distribution facilities and all other properties devoted to electric service.

According to the census of electrical industries for 1937, the privately owned electric utilities in the United States had an electric plant investment of $11,936,205,264.00 and an installed generator capacity of 32,192,918 kilowatts.

On the basis of these two figures, the average investment per kilowatt of all privately owned electric utilities in the United States was $370.77, which is substantially higher than the $257.05 for the three companies of the Wisconsin-Michigan group.

3606 One of the reasons why the investment per kilowatt of the Wisconsin-Michigan companies is low, is that the investment in the power plants of Wisconsin Electric Power Company is low.

I have previously stated that the investment in the Lakeside plant amounts to only $83.68 per kilowatt, and that the investment apportioned to the present capacity in the Port Washington plant is $79.59 per kilowatt.

—1,651—

In keeping down their investment in facilities required to serve their customers, the companies of the Wisconsin

Michigan group have gone far toward lowering the cost of service to their customers.

Q. Is the combined generating capacity of the Wisconsin Michigan group adequate for its present requirements? A. Yes, it is.

The three companies in this group have power generating facilities with a total dependable generating capacity of 501,310 kilowatts. Of this total, 445,700 kilowatts of capacity is in the generating stations of Wisconsin Electric Power Company. 3608

The Lakeside plant——

Q. (Interposing) Excuse me for a moment. You are distinguishing, are you, between installed capacity and dependable capacity at this point? A. Yes; I will expand that distinction.

The installed generator capacity of a power plant is the rated or name-plate capacity of the generators in that plant and is normally considered the maximum load which those generating units may be called upon to carry continuously. The dependable capacity of a generating station is a measure of the load which that station may be depended upon to 3609 carry at the time the need for capacity is the greatest.

The reason why the dependable capacity of a steam plant

may be different from its installed capacity is that in some instances, such as at the Commerce Street plant of the Wisconsin Electric Power Company, the boilers are required to furnish steam for heating purposes as well as steam for operating the turbines.

If the boilers have just sufficient capacity to drive the electric generating units at the rated load, they will be

unable to furnish steam for heating purposes in addition to that.

When the boilers are furnishing steam for heating purposes, therefore, they are incapable of furnishing enough steam to drive the generating units at the rated load and as a result the dependable generating capacity of the plant is something less than the installed capacity of its electric generators.

In answer to the question as to whether the generating
3611 capacity of the three companies is adequate to serve the loads placed upon them, I was pointing out that the dependable capacity of these plants is adequate to carry such loads.

The total installed generator capacity of the generating stations of the three companies of the Wisconsin Michigan group is 545,480 kilowatts and the dependable capacity of those same stations—that is, the load which those stations may be depended upon to carry at the time the combined load upon all of them reaches its maximum—is 501,310 kilowatts.

—1,653—

Of this total amount, 445,700 kilowatts is the dependable
3612 capacity of the stations of Wisconsin Electric Power Company.

The Lakeside plant has a dependable capacity of 303,000 kilowatts. This figure is less than the installed capacity of 310,800 kilowatts because of the fact that the older turbines in the plant are no longer as efficient as they were originally and require more steam from the boilers to drive the generators connected to them at full load.

The boiler plant of the Lakeside station is also limited in its steaming capacity by the fact that fuel of a lower heat

content is now being burned there than was considered in the design of the furnaces and boilers.

The combination of these two circumstances—that is, the reduced steaming capacity of the boiler due to the use of lower grade coal, and the increased steam requirements of the older turbines—makes it impossible for the boilers to furnish enough steam to drive all the generating units in the plant at rated load.

The dependable capacity of the Port Washington plant is 80,000 kilowatts, the same as its installed generator capacity. 3614

The Commerce Street plant, at the end of 1939, was capable of furnishing a dependable capacity of 27,000 kilowatts.

As I explained above, the boilers in the Commerce Street

—1,654—

plant are called upon to furnish so much steam for heating purposes during the winter months that they are unable to drive the generating unit at full load during that time.

The dependable capacity of the East Wells Street station is 13,700 kilowatts which is the same as the rated capacity of its turbo-generator. 3615

The Racine plant may be depended upon for 22,000 kilowatts, which is 1,500 kilowatts below rated capacity.

Here, again, capacity of the boilers, coupled with limited capacity of piping connecting the boilers with the turbines, reduces the ability of the plant to deliver electrical energy.

The generating stations of Wisconsin Gas & Electric Company are not considered as having any dependable capacity at all.

I have explained that the steam plant at Waukesha is not in regular operation and the three small hydro-electric plants

are operated only when there is enough water in the streams to drive their generating units.

The hydro-electric plants of Wisconsin Michigan Power Company have a combined dependable capacity of 33,900 kilowatts.

Q. As compared with an aggregate installed capacity in the case of the hydro-electric plants of what? A. As compared with a combined installed generating capacity of 36,280

—1,655—

3617 kilowatts.

Q. Now, that dependable capacity of these hydro-electric plants is available only at certain times of the year, but is treated as dependable capacity in this instance for what reason? A. It is treated as dependable capacity in this instance because that is the capacity which the operating records of the plants show could be available at the times when the peak demands on the system occur.

There are other times of the year when the load-carrying ability of the hydro-electric plants of the Wisconsin Michigan Power Company drops to a figure in certain years of less

3618 than 33,900 kilowatts, but those occurrences come at times when the load on the system is not at its peak and it is of no importance whether the capacity is available at that time or not, as long as there is enough of it to carry those reduced loads.

The dependable capacity of the Appleton steam plant is 20,000 kilowatts, the installed generator rating, and that of the Iron River Diesel engine plant is the same as its generator rating of 1,710 kilowatts.

The maximum demand which has occurred up to the present time on the combined systems of the three companies

was 350,600 kilowatts, and took place on December 19, 1939. Of this demand, Wisconsin Michigan Power Company carried 40,000 kilowatts, and Wisconsin Electric Power Company

—1,656—

carried 310,600 kilowatts.

At the time that demand was placed on the system of the three companies, the dependable capacity available to carry load exceeded that demand by 150,710 kilowatts, which may be considered system reserve at the time of the maximum all-time peak. 3620

This amount of reserve is more than adequate, inasmuch as it more than covers the ratings of the two largest units on the system.

Reserve requirements based on the capacity of the two largest units on the system are considered adequate inasmuch as they would provide continuous service in case the largest unit on the system were out of service for repairs and some unforeseen accident should occur to the second largest unit which, at that time, might be carrying load.

The two largest units now on the system of the three companies are the 80,000 kilowatt unit at Port Washington, 3621. and one of the 60,000 kilowatt units at Lakeside, making a total of 140,000 kilowatts which may be compared with the reserve capacity of 150,710 kilowatts.

Q. You have already testified that an additional unit is under construction at Commerce Street, and that an additional unit is proposed at Port Washington. Completion of those two units will add how many kilowatts to the rated

—1,657—

generator capacity of the combined system? A. Completion

of the installation of those two units will add a total of 115,000 kilowatts to the rated generator capacity of the plants of the three companies.

Q. And would you anticipate that that full amount would be dependable capacity? A. Yes, it will be entirely dependable.

Now, in addition to the 35,000 kilowatts of generating capacity which will be added to the Commerce Street plant in the form of a new unit, the dependable capacity of the
3623 present equipment in the Commerce Street plant will be increased to 30,000 kilowatts by the added boiler capacity which is going in along wtih the new generating unit, so that the dependable capacity of the system will be increased by the 35,000 kilowatts representing the new unit, plus 3,000 additional kilowatts representing the improvement in boiler capacity at the Commerce Street plant.

This means that the total additional dependable capacity resulting from the installation of the Commerce Street unit and the Port Washington unit will be 118,000 kilowatts.

Q. You have also testified that a storage reservoir at
3624 Michigamme in the Wisconsin Michigan territory, is under construction, and that completion of that reservoir will add additional capacity to the system. Will you state the amount of that capacity? A. The additional capacity that will be

realized at the present power plants of the Wisconsin Michigan Power Company on the Menominee River, through the completion of the Michigamme River Reservoir will be 3,700 kilowatts and the increased output to be released from the utilization of the water which will be impounded and real-

ized at that reservoir will amount to seven and a half million kilowatt hours per year at the present plants of Wisconsin Michigan Power Company.

Q. And is that figure of 3,700 kilowatts to be regarded as dependable capacity? A. Yes, it will be dependable capacity of the highest order because it will result from the utilization of water whose flow will be under control.

Mr. Hamilton: This is a convenient stopping point, Mr. Examiner. 3626

The Examiner: All right, we will recess until 10:00 o'clock tomorrow morning.

(Whereupon, at 4:30 o'clock p. m., the hearing was adjourned until 10:00 o'clock a. m., September 13, 1940.)

3627

3628

BEFORE THE

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

3629

Hearing Room 1102,
Securities and Exchange
Commission Building,
Washington, D. C.,
Friday, September 13, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

Before:

W. W. SWIFT, *Trial Examiner.*

3630

Appearances:

CHARLES S. HAMILTON, JR., and
S. PEARCE BROWNING, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, and
MISS E. H. CALKINS, Attorneys for the Securities and Exchange Commission.

Edward H. Schmidtman—By Respondents—Direct 3631

PROCEEDINGS

The Examiner: The hearing will come to order.

EDWARD H. SCHMIDTMAN resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Are the transmisison and distribution facilities of the Wisconsin-Michigan group adequate for the companies' 3632
requirements? A. Yes, they are. The companies have continuously kept pace with transmission and distribution requirements by extending and strengthening their systems wherever increased loads indicated that additional capacity was required or would be required.

The frequency and voltage on the systems of the companies is maintained according to high standards. Transmission lines and sub-stations are carefully designed in order to perform adequate service, and also to furnish that service at minimum investment and operating cost.

As a part of the programs of the companies to keep even 3633
with or ahead of transmission and distribution requirements, there will be constructed at the time the new generating unit goes into operation at Port Washington plant, another transmission line from Port Washington to the Milwaukee area.

There will also be built another sub-station, which I have

previously mentioned, to operate at voltages of 132,000 and 66,000, which will have an initial capacity of 15,000 k. v. a.

The initial section of this sub-station is expected to go into operation early in 1941, but the plans for the sub-station provide for an ultimate capacity of 90,000 k. v. a.

Wisconsin Gas & Electric Company now has under construction a 26,400 volt transmission line between the cities of West Bend and Kewaskum. That line is indicated on Exhibit 32 as being under construction.

The transmission circuits now operating at 26,400 volts between West Allis sub-station in the Milwaukee area, and
3635 the Watertown sub-station, are soon to be reconverted to operation at 66,000 volts.

The transmission and distribution facilities of the companies are now adequate to serve present loads and these additions to facilities will keep the system well ahead of requirements for some time to come.

Mr. Binford: Mr. Examiner, some matters affecting the Milwaukee Company financing are being taken up downstairs. I wonder if we could have half an hour recess?

3636 The Examiner: There is no objection to that, is there?

Mr. Hamilton: No objection.

The Examiner: All right. We will just recess until you get back.

—1,662—

(Discussion off the record.)

The Examiner: Mr. O'Dell has come in to take Mr. Binford's place and we can resume.

By Mr. Hamilton:

Q. Had you finished your statement, Mr. Schmidtman? A. Yes, I had,

Q. Is it the practice of the companies in the Wisconsin-Michigan group to carry on a tive sales promotion campaigns? A. Yes, it is the practice of the three companies of the Wisconsin-Michigan group to carry on active sales promotion work.

Each company has been actively engaged in work of 3638
this kind for a number of years. The promotional work carried on by the companies is directed at all classes of service and each company carries on its programs along the lines considered best suited to the circumstances under which it operates.

Wisconsin Electric Power Company is the largest of the three companies and has carried on the most active and most extensive sales promotion work of the three.

The same general policies governing the sales promotion activities of the Wisconsin Electric Power Company have also governed similar work of the other companies and so in 3639
describing some of the examples of the kind of promotional activities that are carried on, I will choose most of them

—1,663—

from Wisconsin Electric Power because they offer the widest range of type.

The sales promotional work of Wisconsin Electric Power Company is carried on largely by people in the sales department. In order to facilitate that work and to organize it along logical lines, the sales department has been set up so as to consist of eight individual divisions. These divi-

sions include the general office division, the appliance service division, the merchandise stores division, the home service bureau, the lighting and rural sales division, the power sales division, the range sales division, and the water heater sales division.

All of these divisions have a bearing on the promotional work carried on by the company, but those most actively engaged in this work are the home service bureau, the lighting and rural sales division, and the power sales and range
3641 sales and water heater sales divisions.

Inasmuch as advertising is an important element in the promotion of sales, the advertising department operates under the direction of the vice president and sales manager, so that the work of the sales department and of the advertising department are closely coordinated in promoting the sales of electric service.

Q. How is promotional work in the industrial field carried on? A. Industrial promotional work is carried on by

—1,664—

the power sales division of the sales department.

3642 We regard the industrial field as one of the most important fields served by the system of the companies inasmuch as it represents not only the bulk of the sales made with respect to kilowatt hours, but that field also furnishes a major portion of the revenue received for electric service.

There is still another reason why we regard industrial sales as of great importance to the companies and that is that in offering attractive rates and carrying on promotional policies which result in maintaining a high industrial consumption of electricity in our area, we feel that we are en-

couraging the industrial growth of the communities where we operate, and in so doing raise general standards, make it possible for the territory to support greater population, and in that manner indirectly promote sales of other classes of service.

In the power sales group there are five general power sales engineers who maintain contact with all the power customers of the company.

Q. You are referring now to Wisconsin Electric Power Company? A. Yes, Wisconsin Electric Power Company, 3644 specifically. The other two companies carry on similar promotional work but on a smaller scale.

—1,665—

The industrial territory of Wisconsin Electric Power Company is divided into five areas or districts and one of the five power sales engineers is assigned to each of these five districts.

The power sales engineers handle all power problems brought up by the power customers within their respective districts.

They serve as electric power advisers to their customers 3645 and are under instructions to give the customers the most sound advice they can and are also instructed that if any customer brings up any problem concerning the application of power to his business and the power sales engineer is unable to handle it individually, he will bring it in to the general office and someone will be found who can give the customer the kind of advice and technical assistance that he needs in meeting his particular problem.

Each power sales engineer keeps a careful watch over the demand and consumption of each of his customers, and if

he discovers that any customer is approaching a point where the magnitude of his consumption, either with respect to demand or with respect to consumption, is bringing him to a point where he can qualify for a different class of service at a lower rate, it is the job of the power sales engineer to advise the customer to that effect and recommend his shifting from the rate under which he is then taking service to

—1,666—

the other rate under which he could qualify for lower
3647 charges.

They also advise the installation of corrective equipment which is electrical equipment that may be installed by customers to improve the power factor of the load they place upon the company's lines.

Ordinarily, this power factor equipment consists of capacitors which draw a leading current and offset the lagging current normally drawn by the type of motors which most industrial customers use in their processes.

A large number of customers, who were originally taking service at secondary voltages and were paying the higher
3648 rates charged for secondary service, have installed their own substations and have changed over to primary service and are now being served under the primary rates, which, because of the fact that the customer owns and operates his own substation, are lower than those of the secondary service.

The power sales engineers also advise customers on such matters as proper methods of installing motor-drives for their various machines and in making their factory wiring lay-outs, the installation of metering equipment and all sorts of special applications of electricity to their processes.

The primary object of the power sales engineer is to make sure that the customers assigned to him are getting their

—1,667—

electric power service at the lowest possible cost under which they can qualify with respect to the company's rates.

As a result of their activity, the industrial power customers of the company have considerable confidence in those individuals and there are many instances in which the power customers have consulted the power sales engineers on matters only remotely related to power matters, but the engineers 3650
have taken their jobs so seriously and have worked so earnestly in the interest of the customers, that some of them have been considered by outsiders to be more representatives of the customers than they are of the company.

The result to the company of this type of promotional activity has been distinctly beneficial with respect to the extent of use of power service by industries in the territories served.

One of the engineers in the power sales division is assigned to industrial heating applications of electricity. He covers the entire industrial area served by Wisconsin Electric Power 3651
Company and maintains contact with all industries in that area which have or may have heating applications of electricity in their manufacturing processes.

The activities of the industrial heating engineer have brought to the system of the company considerable load such as electrical heat-treating and melting of the kind I spoke

—1,668—

of in connction with the Bucyrus-Erie Company, and general furnace operations, as well as a relatively recent applica-

3652 *Edward H. Schmidtman—By Respondents—Direct*

tion of electricity manufacturing processes in the baking and drying of enamels by the use of infra-red light. A special type of furnace has been constructed and made available to industries that utilizes infra-red energy for drying and baking enamels.

Our industrial heating engineer has had contact with a number of customers who have made installations of that type.

Another of the engineers in the power sales division is
3653 assigned to the load resulting from air-conditioning equipment.

In the territory served by the companies in Wisconsin and Michigan, the summers are relatively short and not particularly severe. As a result of that condition there has been no rapid development in the use of electricity for air-conditioning.

A number of installations have been made, however, in some of the larger stores in downtown Milwaukee and we feel that the work of the air-conditioning engineer has been distinctly beneficial in encouraging the installation of that type
3654 of equipment.

Two engineers in the power sales division concentrate on commercial cooking and baking applications of electricity.

—1,669—

They cover the entire territory of the company and maintain continuous contact with hotels, restaurants, bakeries, and all other customers with cooking or baking applications of electricity.

Another group within the power sales division makes special studies of various types related to the sale of elec-

3655

tricity for general power purposes. They study rate problems including the effect of special rate provisions and proposed rate provisions and also make extensive studies on the relative economies of private plants operated by certain customers as compared with power purchased from the Wisconsin Electric Power Company.

The activities of this group on studies of this kind have been quite influential in reducing the number of private generating stations operated by customers within the territory of the company.

3656

It has been the policy of the sales department for a number of years to stand willing to furnish service to customers who have generating facilities sufficient to produce a part of their own power requirements. By being willing to connect with such customers and furnishing stand-by or break-down service to them at the standard rates applicable for such service, the company has been successful in establishing contact with a large number of customers who were not willing to purchase their entire power requirements and who would

—1,670—

3657

not have taken any service from the company at all if the company had insisted on rendering all of it or none of it.

By establishing these connections, the company has been in position to take over the complete service of many of these customers when their own power generating facilities have either worn out or have become obsolete or inapplicable to the uses which they formerly served.

The Wisconsin Electric Power Company is now furnishing the total electrical requirements to thirty-two industrial customers who formerly generated all of their energy, and to

3658 nine industries which formerly generated a part of their energy.

The company is also supplying a part of the electrical requirements of twenty-seven customers who previously generated all of their power and to ten industries who have always generated a part of their own requirements.

These figures show a material reduction in the number of private plants operating in the territory and an appreciable increase in number of customers now being served who
3659 formerly were not served.

We feel that the investigations and recommendations of the special group of the power sales division has played a large part in this progress.

Q. Does Wisconsin Electric Power Company cooperate —1,671— with dealers in its territory in the sale of electric appliances? A. Yes, it does. Dealer cooperation is really the foundation upon which the entire merchandising policy of Wisconsin Electric Power Company is based.

3660 The company conducts merchandising efforts on small appliances and lamps and sells ranges and water heaters, and also carries on extensive dealer cooperation in the sale of ranges and water heaters.

The companies of the group do not sell commercial electric equipment of any kind, but confine their activities to appliances and other electrical equipment suited for use in the home.

In 1938, the dealer cooperation policy was strongly emphasized by a sales promotion program which strongly increased the extent of cooperation between the company and

the dealers. Wisconsin Electric Power Company held a meeting of the electrical dealers, contractors and material houses which was attended by more than 1,800 representatives of these concerns.

At that time, the company agreed to furnish the advertising, to furnish all instructions to purchasers, do the servicing of all appliances under the sales guarantees, and to also finance sales contracts of the dealers.

Those policies have continued in effect and are still being followed today. 3662

—1,672—

Wisconsin Electric Power Company finances electrical dealers and contractors for rewiring residential and farm buildings, and also finances the sale of electrical farm equipment.

In financing these wiring projects and appliance sales, the company purchases the installment payment contracts from the dealers so that the dealers are not required to carry substantial charge accounts and by so doing, the dealers and contractors are kept in position to make additional sales and to make additional installations without coming 3663 gradually to the point where their capital is all tied up.

The company assists contractors who are unable to finance accounts in carrying out such financing. The services of the company engineers are available on problems related to air-conditioning, commercial cooking and baking, without any charge.

These services, you will note, apply to commercial applications of electricity.

The company refrains from direct sales of any general power and lighting equipment or air-conditioning or com-

3664 *Edward H. Schmidtman—By Respondents—Direct*

mercial refrigeration, or commercial cooking, baking, heating or ventilating equipment.

Those fields are left entirely to the dealers. The company does cooperate, however, in the sale of such equipment by furnishing free the services of its engineers that are quali-

—1,673—

fied to give advice on problems relating to it.

Q. The purpose of this program, of course, is the increased use of electricity, is it not? A. Yes, that is the entire
3665 purpose of the program.

Q. And has the program been successful in that regard? A. Highly so.

Q. Now, without detailing too much the promotional policies which Wisconsin Electric Power Company has pursued, would you illustrate some of those particular projects that have been undertaken to indicate the general character of the promotional work in other respects than you have already indicated? A. Wisconsin Electric Power Company has conducted certain special programs in connection with its general sales promotion campaign at various times during
3666 recent years.

One of them that was conducted in 1938 was called the "Gift-of-the-Month" plan. It was carried on over a period of several months and was sponsored jointly by the company and by electrical dealers in the territory.

It consisted of a limerick contest. The first four lines of the limerick would be supplied on an official entry blank, and the contestant would supply the last line. The limericks all referred to electrical service, of course, and considerable interest was aroused by the contest.

—1,674—

Each month, prizes were awarded consisting of major electrical appliances. The purposes of this contest were, first, to identify the location and identity of the various electrical dealers within the territory so that the public would become conscious of the fact that the dealers are there ready to serve them.

Another idea was to bring the people into the stores. That was accomplished by requiring the entries to be made on an official entry blank which could be obtained only from the dealers. 3668

Another object was to create interest in the particular appliance being offered as a prize each month and also to make the public electrical-conscious by bringing the subject to their attention.

Considerable interest was shown in this "Gift-of-the-Month" plan as indicated by the fact that during the year, 41,000 entries were made. Many customers were brought into the stores and the dealers, themselves, were quite enthusiastic over the results of the plan because it accomplished the four purposes it was intended to, and also stimulated the interest of the dealers, themselves, because they felt 3669 called upon on repeated occasions to explain to the customers that electric service can be had at low cost under the rates in effect. —1,675—

(Discussion off the record.)

By Mr. Hamilton:

Q. Has the company conducted campaigns directed to insure adequacy of wiring in homes and offices of customers in the territory? A. Yes, it has. The adequate wiring

program of the company was inaugurated in 1938 and is being presently continued as one of the regular promotional policies. Realizing that the limited capacity of the wiring installations in many older buildings was a bottleneck in the merchandising of electrical service, Wisconsin Electric Power Company instituted a program in 1938 which has been most beneficial and effective in increasing the sale of electrical service.

This was called the adequate wiring program and was
3671 intended to encourage the installation of more adequate wiring either in existing premises or in buildings under construction at the time.

The industrial organization of the territory, including the Electrical League of Milwaukee, enlisted in this program which was carried on by all branches of the electrical industry in the district.

One of the features of the adequate wiring program was a large and complete wiring display at the Milwaukee Home Show. This home show is conducted annually in the city auditorium. It attracts crowds running up to and above
3672 —1,676—
100,000 visitors a year.

It is carried on for a period of slightly over a week. The demonstration that was given at the 1938 home show aroused considerable interest and gave the adequate wiring program an excellent send-off.

At that demonstration, wiring specifications were distributed, sample wiring specifications, and it was made clear that the company stood ready to assist architects and builders and contractors in laying out wiring plans for any buildings.

The specifications are also made available to home owners and when a person is in the process of constructing a home, if he will let the company know that he is building the home and request assistance, he will be furnished a complete wiring layout answering all the specifications of the wiring code and incorporating numerous modern developments in the arrangement of wiring circuits so as to provide outlets and switches most conveniently arranged for adequate use of electricity in the home.

The specifications in the standard booklet were distrib- 3674
uted at the home show. The booklets were very well received inasmuch as the first 5,000 that were printed lasted only two months and reprints have had to be made since that time.

In recognition of the owners of homes which have ade-
—1,677—
quate wiring, certificates are awarded by the Electrical League of Milwaukee certifying that the home at that particular address owned by that individual has an adequate wiring installation.

Q. Have you stated what the Electrical League of Mil- 3675
waukee is? A. The Electrical League of Milwaukee is an organization of electrical dealers and contractors operating in the Milwaukee area.

We have a common interest in that the contractors are anxious to install a type of wiring system that will support the type of lighting and appliances which are considered requirements in a modern home.

The certificate awarded to owners of adequately wired homes are accompanied by an illuminated bronze frame house number carrying the symbol of the Electrical League.

3676 *Edward H. Schmidtman—By Respondents—Direct*

A number of low-cost homes are under construction at all times of the year in the territory served by the companies, and the tendency among the builders of those homes who are putting them up just for sale is to minimize on the wiring installations.

A number of those homes were under construction at the time the adequate wiring program was instituted in 1938. Contact was established with the builders of those homes and the activity of the adequate wiring program did have
3677 the effect of improving to some extent the wiring being in-

—1,678—

stalled in those homes.

The company has also been told by a number of those builders that if the adequate wiring program arouses sufficient interest on the part of the public to make it possible for them to recover the cost of more extensive wiring installations on the sale of their buildings, that they will be glad to put them in.

We feel that that has been an appreciable step forward in the elimination of wiring plans which are not considered
3678 up to modern standards.

Q. Are there other promotional programs which the company conducts? A. Yes, there are. The home service bureau, which I mentioned as being one of the divisions of the sales department, conducts cooking and lecture demonstrations regularly throughout the year.

One series of those demonstrations is given during the months of January to June, inclusive, and the months of October to December, inclusive.

These demonstrations are given regularly once a week on electric ranges.

3679

Another series are given twice a month covering electric roasters. Four times a month there are lecture demonstrations on the use of general electrical appliances in the home,

—1,679—

including refrigerators, food mixers, washing machines, flat irons and ironing machines, percolators, waffle irons, and all the other standard electrical home appliances.

These demonstrations have been extremely popular among the women of the territory and have had an average attendance of over 200, resulting in attendance for the year 3680
of about 16,000 women.

These demonstrations which are given in the auditorium of the company's main office building, are scheduled as regular demonstrations, but in addition to these, special ones are given by appointment.

In this class would fall demonstrations and lectures given before Parent-Teacher organizations, church groups, and various other women's groups who meet regularly and arrange to have one or more of their meetings during the season in the company building.

These special meetings occur about once a week and are 3681
sandwiched in between the regularly scheduled cooking demonstrations. The average attendance at these is slightly less than at the public meetings, averaging about fifty.

An interesting example of these special demonstrations was a series that was given particularly for brides and prospective brides. The average attendance at these meetings was over a hundred.

Additional demonstrations are given at various points

—1,680—

3682 all over the territory served and not just within the company's office building.

Our demonstrators go to country churches or town halls, or to any buildings at which the meetings are called, and give their demonstrations covering the particular appliance which is to be covered.

One of the features of these special demonstrations given in the rural territory is that each one is given with the assistance of a modern kitchen sink with hot and cold run-
3683 ning water.

It doesn't matter whether the demonstration is given in a tent, we still have the sink with hot and cold running water because the company maintains a special self-contained unit in a fifty-gallon water heater tank which contains a water storage tank, an electric water heater, and a pump, and special piping which makes it possible to deliver the hot water and the cold water to the sink.

We feel that along with our cooking demonstration that sink not only facilitates the demonstration, but it tells a story between the lines.

3684 A new special training activity was recently instituted for the training of the coming generation of housewives. The classes were conducted at Milwaukee Downer College, which is a women's college located in Milwaukee, on adequate wiring and electric ranges and roasters.

—1,681—

These demonstrations were so enthusiastically received that the company was requested to extend the scope to include refrigeration, laundry equipment and other residential electric equipment.

Classes are now offered to other schools in the Milwaukee area on the same basis.

Q. The company maintains an electric home display at its present office in Milwaukee? A. Yes, in the sales quarters of the building in space adjacent to one of the sales rooms, the company maintains a completely equipped electric home.

Q. Does that display attract a substantial attendance during the course of the year? A. Yes, it does. The home is open to the public at all times of the year whenever the offices of the building are opened. The attendance is par- 3686
ticularly heavy during the Christmas season when special displays of cookies and candies are made and recipe books, which you will find in a surprisingly high percentage of the households of our territory, are distributed annually to the public.

Our recipe books have been sent to all parts of the country and 60,000 have been distributed on an average ever since the recipe books have been made available to the public.

The average attendance during the Christmas season runs between 1,000 and 6,000 people per day, averaging for a
—1,682— 3687
year about 75,000 visitors.

Q. I think you mentioned that the company maintains a staff of lighting engineers. Will you elaborate a little further without going into detail on what the function of this particular branch of service is? A. Yes. The lighting engineers work with architects, builders and customers on lighting problems. They are the people who prepare the wiring specifications for home owners who request them.

Each man has his own territory and is responsible for maintaining proper contact with customers in his territory.

3688 *Edward H. Schmidtman—By Respondents—Direct*

In connection with the work of the lighting sales engineers, the company maintains in its sales quarters a laboratory for studying lighting equipment and light effects.

The company has also a force of four home lighting advisers who specialize on lighting in homes. These advisers are women who call at homes by appointment or by canvass. Each woman travels in a light sedan delivery truck and carries with her demonstration equipment and portable lamps and a supply of electric light bulbs.

3689 These women have produced appreciable increased sales and additional lighting load and have had a very good effect on customer relationships.

Q. Does the company sponsor a lecture program? A. Wisconsin Electric Power Company sponsors a lecture

—1,683—

within its territory entitled "The Miracle of Light". This lecture is given by an experienced lecturer in the employ of the company and consists of a demonstration of practical and spectacular lighting effects.

It was conceived in 1934 and was used during the suc-
3690 ceeding four years as a part of the "Better Light-Better Sight" campaign which was carried on all over the country.

In 1938 it was revised by the introduction of special equipment and additional features which made it even more spectacular and popular than it was before.

During the first six weeks of the new form, the lecture was given twenty-one times with a total attendance of over 1,650 people. It is now booked widely for high school assemblies and other groups enjoying an attendance of from 500 to a thousand high school students at each showing. It is given at schools only upon request of the school authorities.

3691

Q Are there campaigns conducted leading toward increased sales of lamp bulbs? A. Each year Wisconsin Electric Power Company conducts two lamp bulb sales campaigns, one in the spring and one in the fall.

Prior to June, 1935, the lighting service schedules of Wisconsin Electric Power Company included free renewal of burned-out lamps to all lighting customers in those schedules

—1,684—

to which free renewals were available.

3692

In June, 1935, a change in electric service rates was made and the free renewal of lamp bulbs was discontinued. In order to make sure that the customers continued keeping themselves supplied with bulbs for replacement of burn-outs, the company instituted the program of conducting these lamp bulb sales campaigns twice a year.

The campaigns are widely advertised by the company and are carried on by the employees and the local dealers. The lamps are sold in sets of six, contained in what is called the "handy household bag", the price of which is equal to the total retail price of each of the six bulbs in the bag.

3693

In order to stimulate these sales, in the fall campaigns the company gives with each bag purchased, a coupon which entitles the purchaser to a free 100 watt bulb. These coupons are accepted by the dealers in exchange for the bulbs and then are redeemed by the company which replaces the bulbs in the stock of the dealers, the particular feature of this being not only to stimulate the sales, but to bring the customer to the dealer's place of business.

Q. Now, here again, as in all these programs which I have described, the intention is to increase the use of electricity, is that right? A. Yes.

3691 *Edward H. Schmidtman—By Respondents—Direct*

Q. And necessarily they would not be conducted unless

—1,685—

they resulted in increase of sales and service? A. Yes, that is correct. If it appeared that these campaigns were not producing results in the forms of increased sales and service, they would not be continued.

Q. Now, all these illustrations you have been giving relate to Wisconsin Electric Power Company, as I understand it? A. Yes, they do.

3695 Q. You have already stated that the promotional campaign of the Wisconsin Michigan Power Company and the Wisconsin Gas & Electric Company were somewhat more limited. Again, without going into any detail, will you indicate briefly what activities in that direction the latter two named companies do conduct? A. Wisconsin Gas & Electric Company maintains in its office building in Racine, a demonstration kitchen and lecture hall in which meetings similar to those conducted in Milwaukee are held.

Wisconsin Gas & Electric Company also has lighting advisers and power sales engineers who perform functions simi-

3696 lar to those of the specialized groups operating out of the Milwaukee office.

Wisconsin Michigan Power Company has, as one of the features of its promotional work, an electrically equipped kitchen built on a gasoline truck.

—1,686—

This moving kitchen is necessary in order for the company to reach its widely flung territory.

Wisconsin Michigan Power Company also maintains a force of sales people who devote a portion of their time to promotional activities such as those I have described.

3697

Q. Have the policies of the companies comprising the Wisconsin-Michigan group with respect to electrical rates been progressive in their character? A. They have been very progressive. The management of the three companies has followed a promotional rate policy for many years and rates have been reduced voluntarily by these companies as rapidly as operating conditions made such reductions possible.

These policies have been practiced through a long-range rate reduction program followed by the companies. The structure of the rates is given careful consideration so as to 3698
be designed to benefit the companies as well as the customers.

Simplicity in rate structures has also been sought and the companies have been alert to the need for developing new types of rates to meet the requirements of new or different types of service requirements.

During the early years of operation of the companies, the rates were high in comparison with what they are today. That was true of utility systems all over the country. In

—1,687—

1907, the year in which the Wisconsin Railroad Commission was created, Wisconsin Electric Power Company made its 3699
original filing of rates on September 1. These rates covered only a single schedule, with two classes of service, one for lighting and one for power.

The lighting rate was 12 cents per kilowatt hour for the first one hundred kilowatt hours per month, and scaled down to four cents per kilowatt hour for all consumption over 600 kilowatt hours per month.

The power schedule started at 8 cents a kilowatt hour for the first 100 kilowatt hours per month and ranged down-

3700 *Edward H. Schmidtman—By Respondents—Direct*

ward to a bottom step of 3 cents per kilowatt hour for all consumption over 600 kilowatt hours per month.

In the case of lighting service, the minimum monthly bill was $1.00 and in the case of the power service, the minimum monthly bill was $2.00 for motors of 2 horsepower or less, plus $1.00 per horsepower or fraction thereof above two.

The company has always followed the policy of having the most advanced type of rates in effect. In keeping with that policy, on September 1, 1910, the original schedules were
3701 revised. The revised schedules which were well ahead of rates in general at that time, provided separate rates for light and power, for residential lighting, for flat rate display lighting, and for short-term light and power, different

—1,688—

schedules for all these different classes of services.

Q. Now, that diversification among classes of service was unusual, was it, at that time? A. It was unusual in Wisconsin. As to what other utilities in other parts of the country were doing, I don't know, but in Wisconsin, this was the first filing of rates that distinguished between these
3702 several classes of service.

These rates also embodied other features which were new in electric rates in Wisconsin, the schedule for lighting service including free renewal of electric light bulbs. The power service schedule made provision for two off-peak demand periods, one covering daytime hours shifting with the seasons, and another covering the period between 10:00 p. m. and 7:00 a. m.

During those periods of the day, customers received a premium for reducing their demands on the peak hours and using the energy during the night hours. The residential

rate schedules at that time contained another feature which was new in electric service rates in Wisconsin.

The consumption steps were based on the number of rooms in the home rather than on the number of hours' use of connected load. The connected load basis was commonly used in the state at that time.

The average home, according to the basis on which the rooms were counted at that time, contained three active rooms resulting in a first step of twelve kilowatt hours which

—1,689— 3704

was billed at 12 cents, a second step of 88 kilowatt hours which was billed at 5 cents per kilowatt hour, and all consumption over 100 kilowatt hours were billed at 4 cents per kilowatt hour.

This chedule was a substantial reduction from that filed three years previously.

The present rates of Wisconsin Electric Power Company contain 39 different schedules. Three of these are optional schedules carried over from previous schedules which were changed, and the other 36 are the regular schedules which superseded the earlier forms. 3705

Q. Are the present rate schedules promotional in character? A. The residential rates are very promotional in character, in that they encourage customers to increase their use of service by providing for lower unit charges on the higher steps of the schedule.

—1,690—

Wisconsin Electric Power Company has three different schedules for residential electric service.

Rate 1 covers the Milwaukee metropolitan area including the city of Milwaukee and its immediate suburbs.

3706 *Edward H. Schmidtman—By Respondents—Direct*

Rate 2 covers the Racine, Cudahy and South Milwaukee districts, and rate 3 covers all other electric service territory of the company.

All three of these rate schedules provide for a minimum monthly service charge of 60 cents, which is billed to the customer whether he takes any electricity or not. This service charge is intended to cover the fixed items of rendering electric service such as fixed charges on the investment in facilities, the cost of reading the meter, accounting for the
3707 account, making out the bill, and collecting.

In addition to the monthly minimum fixed charge of 60 cents, rate 1, which is effective in the Milwaukee metropolitan area, specifies a rate of 3.25 cents per kilowatt hour for the first fifty kilowatt hours consumed per month, 2.25 cents per kilowatt hour for the next fifty kilowatt hours consumed per month, 2 cents per kilowatt hour for the next 100 kilowatt hours consumed per month and 1.75 cents per kilowatt hour for all monthly consumption over 100 kilowatt hours.

—1,691—

These rates are net rates and are not subject to discount.

3708 Q. Or penalties either, is that right? A. No, that is not true. I was going to continue my statement by saying——

Q. Excuse me. A. —that the schedules provide both gross and net rates. If the bill is not paid within the discount period which ordinarily extends ten days beyond the date of delivery of the bill, then it is collected at the gross rate which is shown on the bill along with the net rate.

Rate 2 includes an energy schedule of 2.75 cents per kilowatt hour for the first fifty kilowatt hours per month, 2½ cents per kilowatt hour for the next fifty kilowatt hours per

month, and for all consumption over 100 kilowatt hours per month, the steps of the schedule are the same as those for rate 1.

Here again, these rates are net. Rate 3 for residential service of Wisconsin Electric Power Company provides an energy charge of four cents net per kilowatt hour for the first fifty kilowatt hours consumed per month, 2½ cents net per kilowatt hour for the next fifty kilowatt hours consumed per month, and for all consumption over 100 kilowatt hours monthly the net charges are the same as in rate 1. 3710

Wisconsin Gas & Electric Company also has three residen-

tial rate schedules.

Q. Did I understand you to say "schedules"? A. Yes, three residential rate—well, rate areas—each distinguished by different charges under the same general residential rate schedule.

One of these rate areas includes the Kenosha and Waukesha districts; the second one includes the cities of Burlington, Fort Atkinson, Watertown, West Bend, Barton, and Whitewater; the third one covers all other electric service 3711 territory of Wisconsin Gas & Electric Company.

As in the case of Wisconsin Electric Power Company, the residential rate schedules of Wisconsin Gas & Electric Company provide a minimum monthly charge of 60 cents which is referred to as a service charge and does not carry with it any kilowatt hours to the customer.

The energy steps of the rate in the first two areas served by Wisconsin Gas & Electric Company are the same as the rates charged for electric service under rate 2 of Wisconsin Electric Power Company.

3712 *Edward H. Schmidtman—By Respondents—Direct*

In the third rate area of Wisconsin Gas & Electric Company, the steps of the energy schedule are as follows:

4.25 cents per kilowatt hour for the first fifty kilowatt hours consumed per month.

2.75 cents per kilowatt hour for the next fifty kilowatt hours consumed per month.

—1,693—

2 cents per kilowatt hour for the next 100 kilowatt hours consumed per month; and

3713 1.75 cents per kilowatt hour for all monthly consumption in excess of 200 kilowatt hours.

Wisconsin Michigan Power Company also has three residential rate areas in Wisconsin and also has two in Michigan. In Wisconsin, the first area includes the Appleton-Neenah metropolitan district; the second includes all the southern division which is the territory centering around Appleton, except the Appleton-Neenah metropolitan area; and the third includes the territory served by Wisconsin Michigan Power Company in northern Wisconsin.

3714 In Michigan, the first rate area includes the city of Iron Mountain and Kingsford and the township of Breitung; and the second rate area includes all other electric service territory of Wisconsin Michigan Power Company in the state of Michigan.

All the residential electric service schedules of Wisconsin Michigan Power Company provide for the net monthly service charge of 60 cents.

In addition to that charge, the rate effective in the Appleton-Neenah metropolitan area carries a charge of 3.75 cents per kilowatt hour for the first fifty kilowatt hours con-

sumed per month, 3 cents per kilowatt hour for the next fifty kilowatt hours consumed per month, 2 cents per kilowatt

—1,694—

hour for the next 100 kilowatt hours per month, and 1.75 per kilowatt hour for all consumption over 200 kilowatt hours per month.

The rates for residential electric service in the southern division outside the Appleton-Neenah metropolitan area and in the northern Wisconsin territory are the same. They provide, in addition to the net monthly service charge of 60 3716 cents, an energy charge consisting of 4.25 cents per kilowatt hour for the first fifty kilowatt hours consumed per month and for all consumption over fifty kilowatt hours, the rates are the same as in the Appleton-Neenah metropolitan area.

The residential electric service rates of Wisconsin Michigan Power Company in Iron Mountain, Kingsford and the township of Breitung are the same as those in the Appleton-Neenah metropolitan area, and in all other territory in Michigan, the company's residential service rates are the same as those in the northern Wisconsin territory.

3717

Mr. Hamilton: May this document be marked for identification as Respondents' Exhibit No. 37?

The Examiner: Yes, it may.

(The document referred to was marked for identification as Respondents' Exhibit No. 37.)

By Mr. Hamilton:

Q. Will you explain, Mr. Schmidtman, what Respondents' Exhibit No. 37 for identification purports to portray? A.

—1,695—

This exhibit is a blueprint chart showing in graphic form the trend of the average price of residential electricity to customers on the system of Wisconsin Electric Power Company and in the United States, as a whole, for the years 1910 to 1939, inclusive.

The price of electricity is indicated in cents per kilowatt hour.

Q. And has this chart been prepared under your supervision? A. Yes, it has.

3719 Q. And the facts shown as to the rate of Wisconsin Electric Power Company have been taken from the record of that Company? A. They were.

Q. Will you state the basis for the curve showing the average for the United States? A. The curve showing the average for the United States was plotted from data published in the statistical bulletin of the Edison Electric Institute.

Mr. Hamilton: I offer the chart in evidence as Respondents' Exhibit No. 37.

Mr. Binford: No objection.

3720 The Examiner: It is so admitted under the number mentioned.

(The chart referred to was received in evidence as Respondents' Exhibit No. 37.)

By Mr. Hamilton:

Q. Data as to Wisconsin Michigan Power Company and Wisconsin Gas & Electric Company does not appear on Ex-

hibit No. 37. Can you give the comparable data for those two companies in terms of average rates for the year 1939? A. As indicated by the curves in Exhibit 37, the average price of residential electricity sold by Wisconsin Electric Power Company in 1939 is slightly over 3 cents per kilowatt hour. The exact figure is 3.01 cents.

The average for the United States as a whole is shown by the exhibit to be slightly over 4 cents per kilowatt hour. The actual figure is 4.03 cents.

3722

Comparable figures for Wisconsin Gas & Electric Company are 3.75 cents per kilowatt hour for 1939 and for Wisconsin Michigan Power Company 3.44 cents per kilowatt hour.

It will be observed that the figures given for Wisconsin Gas & Electric Company and Wisconsin Michigan Power Company both fall below the average for the United States as a whole.

The Examiner: We will have a short recess.

(Whereupon, a short recess was taken.)

3723

The Examiner: Let us resume, gentlemen.

Mr. Browning: If the Examiner please, we expect that Mr. Schmidtman's testimony will not consume a great deal more time and we had expected that he

—1,697—

would finish his testimony on Monday. We had then planned to put on the stand Mr. G. W. Van Derzee, vice president and general manager of Wisconsin Electric Power Company.

3724 *Colloquy*

I am now advised that Mr. Van Derzee has received a subpoena to appear before a Federal grand jury in Milwaukee and that he has been told that he will be called before the grand jury some time next week, the exact time being as yet uncertain.

In view of this situation, we feel forced to request an adjournment until Monday, September 23.

In view of the prior discussions on adjournments, I feel that I should add that this adjournment is in
3725 no way an advantage to us, but rather a disadvantage and that we request an adjournment most reluctantly.

Mr. Binford: Mr. Examiner, I understand from counsel for Respondents that there is no other witness available who could continue testimony relative to the properties now under consideration in this case and that they are not prepared to go ahead with any other phase of the case at this time, is that correct?

Mr. Browning: That is correct.

Mr. Binford: Under the circumstances, I have no
3726 objection to granting the motion.

The Examiner: Very well, this proceeding, in view of the circumstances, is now continued until 10:00

—1,698—

a. m. on Monday, September 23.

(Whereupon at 12:20 o'clock p. m., the hearing was adjourned until 10:00 o'clock a. m., Monday, September 23, 1940.)

—1,699—

BEFORE THE 3727

Securities and Exchange Commission

Docket No. 59-10

IN THE MATTER

of

THE NORTH AMERICAN COMPANY, *et al.*

3728

Hearing Room 1102,
Securities and Exchange Commission Building,
Washington, D. C.
Monday, September 23, 1940.

Met, pursuant to adjournment, at 10:00 o'clock a. m.

3729

Before: W. W. SWIFT, *Trial Examiner.*

Appearances:

CHARLES S. HAMILTON, JR., and S. PEARCE BROWNING, JR., of Sullivan & Cromwell, 48 Wall Street, New York City, Attorneys for the Respondents.

RALPH C. BINFORD, and MISS E. H. CALKINS, Attorneys for the Securities and Exchange Commission.

—1,700—

3730

PROCEEDINGS

The Examiner: The hearing will be resumed.

Mr. Browning: If the Examiner, please, we should like to interrupt Mr. Schmidtman's testimony briefly by putting on the stand Mr. Colbert.

The Examiner: Very well.

Mr. Browning: Will you take the stand, Mr. Colbert?

3731 Whereupon, ASEL R. COLBERT a witness produced on behalf of the Respondents, having been first duly sworn, was examined and testified as follows:

Mr. Browning: I should like the record to show that Mr. Colbert is appearing here under subpoena.

The Examiner: Yes, the record will show that.

Direct Examination by Mr. Browning:

Q. Will you give your full name and address to the stenographer? A. Asel R. Colbert, 738 Oneida Place, Madison, Wisconsin.

3732 Q. Will you give us your occupation, Mr. Colbert? A. I am chief of the Accounts and Finance Department of the Public Service Commission of Wisconsin.

Q. How long have you held that position? A. I have been chief of the department since 1935. Prior to that time I was with the department in the capacity of special public

—1,701—

utility investigator, having first joined the staff of the Public Service Commission in 1931.

Q. You have been with the Wisconsin Commission, then, since 1931? A. I have.

 3733

Q. Are you fully familiar with all of the activities of the Wisconsin Public Service Commission, insofar as regulation of utilities is concerned? A. I am generally familiar with all its activities and particularly familiar with the activities dealing with the utility industry.

Q. Will you tell us, briefly, your experience prior to your joining the staff of the Wisconsin Commission in 1931? A. I graduated from high school in 1920, following which I served a year in the United States Navy. After being discharged from the navy I studied accounting for two years 3734
with Pace & Pace and LaSalle Extension University.

After holding a number of relatively minor accounting positions, I became an accountant with the Chicago Heights Terminal Transit Railroad, at Chicago Heights, Illinois, in 1924.

In 1927, I was associated as an accountant with M. W. Cookerow, C. P. A. and attorney at law, associated with the office of C. Bascom Slemp.

In 1928, I joined the staff of the Federal Trade Commission as an accounting examiner engaged in the investigation 3735
of utility holding companies and their servicing and operat-

ing companies under the Walsh resolution, and as stated, in 1931 I joined the staff of the Public Service Commission of Wisconsin where I remain today.

Q. You were associated with the Federal Trade Commission from 1928 to 1931? A. I was.

Q. Will you please state briefly the history of regulation of Public Utilities by the Public Service Commission of Wisconsin? A. The regulation of utilities in Wsconsin, in

3736 *Asel R. Colbert—By Respondents—Direct*

its modern form, commenced in 1905 when the Railroad Commission of Wisconsin was organized and assumed jurisdiction under the statutes of the Railroad and Telegraph carriers.

In 1907, the regulatory act was broadened so as to include the regulation of electric, gas, water and telephone utilities. The Act was again modified in 1911 so as to increase the statutory authority over the regulation of security issues of utilities.

3737 In 1931, the Railroad Commission of Wisconsin was reorganized as the Public Service Commission of Wisconsin and the statutes broadened so as to give the Commission increased jurisdiction over transactions between affiliated companies and to provide also for the assessment of the cost of regulation against the utilities regulated.

Briefly, from 1907 the Commission has had broad powers

—1,703—

over the regulation of utilities and has regulated, effectively regulated, the issues of utility securities since 1911.

3738 Q. What is the present composition of the Commission and its staff? A. The Commission is composed of three members appointed by the Governor for terms of six years each. The Commission's staff is organized into several departments which may be classified as the administrative department, consisting of the Secretary of the Commission, and the necessary stenographic and clerical force to take care of the detailed office routines.

There is a legal department consisting of trial examiners and staff attorneys of approximately fourteen.

The engineering department consists of about forty employees whose duties, as the name implies, is to take care

3739

of those phases of regulation in which engineering ability is necessary.

We have a rates and research department comprised of about thirteen employees whose duties are basically to exercise continuing jurisdiction over the rates charged by the utilities. We have an accounts and finance department of which I am the chief, which has thirteen employees and whose duties are to administer the accounting regulations of the Commission and the regulation of securities of the utility companies.

3740

There is also a transportation division which administers the statutes dealing with the regulation of the railroad and motor carriers.

—1,704—

All in all, there are about 150 employees with the Commission.

Q. Will you please describe briefly for us how the Wisconsin Commission exercises its jurisdiction over public utilities? We might take rates first. A. The Commission does exercise jurisdiction over the rates of utilities. All rates must be filed with the Commission and must be approved before they are legal rates.

3741

Our rates and research department exercises continual supervision of the rates. For example, we not only receive from the utilities an annual report covering the operations of the preceding year, but we receive a monthly report covering the results of operations for each of our large electric utilities, which covers about 85 per cent. of the gross revenues derived from the sales of electricity in the state.

3742 *Asel R. Colbert—By Respondents—Direct*

These reports are under continual review by the staff and if the indications are that returns being earned are too high, negotiations are undertaken with the utility looking towards a reduction of the rates.

If agreement can not be reached, formal proceedings may be instituted by the Commission on its own motion. There are, of course, also the cases which originate on complaint of the customers.

By and large, the Commission follows the process of reg-
3743 ulating by negotiation to a considerable extent as we have found that actions can be quicker and in general more satis-

—1,705—

factory where negotiations are undertaken rather than by the immediate institution of a formal proceeding.

In continuing the method of exercising jurisdiction over rates, my department, the accounts and finance department, reviews the reports of each of the utilities. We submit, as a matter of routine, a statement to the rates and research department whenever we find a utility whose reports indicate that its returns are on the high side, following which rates
3744 and research will take the necessary steps looking toward reduction in rates.

We have been rather successful in obtaining rate reductions in Wisconsin. Commencing in 1931, when the Commission was reorganized as the Public Service Commission, our rates were a little higher than the national average and our consumption a little lower than the national average.

In the succeeding ten years, we have reversed that situation. Our consumption has been increased above the national average and our rates have been reduced below the national average.

 3745

Q. How does the Commission exercise its jurisdiction over service furnished by the utilities? A. Our engineering department has a separate group of engineers engaged in checking the service rendered by utilities. Upon receipt of a complaint from customers as to the quality of service rendered, the matter is investigated by this staff and if a

complaint is found warranted, action is required to correct the situation.

In addition to the inspections upon complaint, this service 3746
inspection is going on continually as a matter of routine. It covers such matters as the voltage at which the current is delivered, the frequency of the current, the error which may be found in the reading of the meters, the listening and talking qualities of telephone service.

In addition to this service inspection work, the Commission has established certain rules governing the service standards in order to assure that the customer is given reasonably adequate service.

Those rules are under revision at the present time. It is
expected that through the revision of our service rules, the 3747
quality of service may be even improved.

Q. Will you tell us what the Commission does with regard to the accounting procedures of the utilities in Wisconsin? A. The Commission has prescribed a uniform system of accounts which applies to all the various classes of utilities operating in the state.

The first system of accounts was prescribed effective in 1909, and since that date, there has always been a prescribed system of accounts in effect in Wisconsin.

3748 *Asel R. Colbert—By Respondents—Direct*

The latest system was made effective January 1, 1938, and is substantially the same as that prescribed by the Federal

—1,707—

Power Commission. We require each of the utilities to submit a rather comprehensive report to the Commission annually, giving the facts concerning the operations and the financial status of the utility, together with a considerable amount of statistical information concerning the physical characteristics of the utilities plant.

3749 These reports are reviewed in the office and if inaccuracies are noted, action is taken with the utility looking toward a correction of its accounts.

We, likewise, inspect the records of a large number of utilities annually. All in all, there are about 1,200 utilities operating in the state. Of course, many are very small, involving only $5,000.00 or less of annual revenue. We can not attempt to audit the accounts of all these utilities, but we do try to cover a large number of them each year and advise them in connection with their records, hoping that by this continual advisory procedure, we will obtain improve-

3750 ment in the accounting methods of the small utilities.

The large utilities are audited at rather frequent intervals. Within the last few years, we have been making investigation of the accounts of all of our large electric utilities in connection with the determination of the original cost of their properties.

The accounts and finance department, likewise, administers the security statutes. Each application for security issues——

—1,708—

3751

Q. (Interposing) Before we get to the security issues, Mr. Colbert, you have testified that some eight utilities which you characterize as "large utilities," do approximately 80 per cent. of the business in the state? A. About eight electric utilities do about 80 to 85 per cent. of the electric business in the state.

Q. Do those eight include Wisconsin Electric Power Company, Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company, the three Wisconsin subsidiaries of the North American Company? A. They do.

3752

Q. And it was in reference to those eight utilities that you said that you conducted frequent audits? A. Yes, those and others as well.

Q. Did you state how long the utilities had filed annual reports with the Wisconsin Commission? A. The utilities have filed annual reports since 1909. I think the first report was required to be filed for the year ended June 30, 1909.

Q. Are those reports open to the inspection of the public? A. They are.

Q. You were about to describe the Commission's exercise of its powers with respect to the security transactions. Will you describe that? A. Under the statutes, the Commission

3753

has rather broad powers over the issuance of securities by public utilities. Each utility must file an application with the Commission asking for approval of the issuance before the securities may be sold or issued.

These applications are investigated by the accounts and finance department and recommendations made to the Commission with respect to the security issues.

3754 *Asel R. Colbert—By Respondents—Direct*

We have, I think, a very good record in connection with regulation of utilities securities. The loss sustained by investors who have put their money into bonds of Wisconsin electric, gas, telephone or water utilities, is just negligible when compared with the total amount of securities issued.

We are gradually working toward an improvement in the securities of our utilities. In connection with most of the refunding operations, which have occurred in recent years, the Commission has insisted upon sinking fund provisions
3755 being included in the bond indenture so that gradually a reduction in the debt of the utilities may be effected.

A further act which the Commission has taken, which should be far-reaching in its effect on the securities of Wisconsin Utilities, is in connection with depreciation accounting.

About two years ago, the Commission issued orders that each electric, gas, water and telephone utility should file their estimates of depreciation expense for certification by the Commission under the terms of the statutes.

—1,710—

3756 Certifications have been issued since that time so that today, with one or two relatively minor exceptions, depreciation rates have been certified for all of the Class A and B electric, gas, water and telephone utilities operating in the state.

I might explain that Class A and Class B utilities include those having more than $50,000.00 of annual revenue.

As a consequence of these actions by the Commission, depreciation reserves for electric utilities have increased substantially. They now amount to about 22 per cent. of the

property of the utilities as contrasted with the national average of depreciation reserves of about 11 or 12 per cent. of the depreciable plant.

It is interesting to note also that in connection with a subject as controversial as depreciation, the Wisconsin Commission has been able to certify depreciation rates for all of these utilities with only one hearing involving the electric and gas utilities, and that hearing was directed to the method of accounting for depreciation rather than to the depreciation estimates, themselves. 3758

Q. Does the Commission engage in valuation of utility property? A. It does whenever valuations are necessary. In many rate cases reproduction cost new appraisals of the property will have to be made and our engineering depart-

—1,711—

ment engages in such work.

There are, of course, cases where appraisals are necessary in connection with the transfer of ownership of property from one utility to another, or from a utility to a municipality in an acquisition case.

Work is also under way at the present time, whereby a 3759
continuing property record will be established for the large electric and gas utilities. This continuing property record is designed to show the number of units of each class of plant and has as its goal, among other things, perpetuation of information which will permit appraisals to be made with a minimum of time and expense.

The statutes provide that the Commission shall value the property of utilities and originally that was done for practically all of the larger utilities in the state. These original

3760 *Asel R. Colbert—By Respondents—Direct*

appraisals were made from about 1909 to 1915 following the organization of the Commission.

The reappraisals have been made subsequently when, as and if necessary.

Q. Does the Commission exercise jurisdiction over consolidations, mergers and acquisitions of utility assets? A. Yes. The statute requires that the Commission give its consent and approval to the transfer of a complete operating unit or system from one utility to another, or to any merger

3761 —1,712—

or consolidation of utility properties.

As a consequence, it is impossible for any of the utilities in Wisconsin to merge or to purchase the assets of another utility, or to dispose of their assets to a utility or to any other person, unless if first obtained the consent and approval of the Commission, and in giving its consent and approval, the statutes require that the Commission must give consideration to the public interest.

Q. Is a certificate of convenience and necessity required to be obtained by a utility before it engages in certain con-

3762 struction? A. In certain instances the Commission grants authority to construct property and no utility may construct additions to the property over and above a certain amount unless it first obtains the authority of the Commission.

An illustration of that is in connection with a proposed addition to the Port Washington Plant of the Wisconsin Electric Power Company; that addition can not be made under the statutes until the company obtains the approval of the Commission to that construction.

Company utilities are required to get approval from the Commission before extending their lines into new territory.

The Commission also has power to issue certificates of convenience and necessity to competing utilities in the event that the service rendered by one utility was found to be improper, and inadequate. That power has been exercised

—1,713—

rarely, if ever, but nevertheless the statutory power is there.

Q. Does the Commission scrutinize transactions between affiliated interests? A. It does. The affiliated interest statute was passed in 1931. Under that statute the Commission is 3764
empowered to inquire into transactions between affiliated interests. It can inquire into the cost to the affiliated interest of any service rendered to the operating utility and the statute provides that it can disallow, in fact, that it shall disallow any items unless there is reasonably adequate proof of the cost of those services.

The Commission, under that statute, has required the utilities to file their arrangements with affiliated interest with the Commission and has scrutinized, and in a number of cases, has approved, these inter-company contracts where it has been deemed in the public interest to do so. 3765

Q. What is the largest electric utility in Wisconsin? A. Wisconsin Electric Power Company.

Q. Do the three Wisconsin subsidiaries of the North American Company constitute the largest utility group in the state? A. They do.

Q. Is the size of the utility any factor in the effective regulation thereof? A. I think that size per se has no effect

—1,714—

on regulation. They have essentially the same problems whether the utility be small. In some respects size might

3766 *Asel R. Colbert—By Respondents—Direct*

make for a reduced cost of regulation in that it would be necessary to deal with only one company as contrasted with a large number of small companies.

Now, there may be a point where size would become a factor such as including the entire utility business of the state within one single company, but as far as I can see, I think size, of itself, does not affect regulation.

Q. Does the fact that the North American Company owns or controls the common stock of the three Wisconsin sub-
3767 sidiaries affect the scope or character of the regulation of those three subsidiaries by the Wisconsin Commission? A. It has not.

Q. Does the existence of the affiliation between the three Wisconsin subsidiaries impair the effectiveness of regulation of those companies? A. No.

Q. Does the fact that Wisconsin Michigan Power Company does business in both the states of Wisconsin and Michigan impair the effectiveness of regulation of that company by the Wisconsin Commission?

3768 Miss Calkins: Just a minute. I think that line of questioning is objectionable because it calls for conclusion of the witness.

—1,715—

This man is undoubtedly an expert, but I think that is an improper line of questioning as to whether or not these relationships between North American and the subsidiaries and the crossing of state lines and the affiliation between these three companies has anything to do with the effective regulation of these companies.

I think it calls for a conclusion of the witness which is improper.

The Examiner: Please read the question to me.

(Whereupon, the pending question was read by the reporter.)

The Examiner: Objection overruled.

Miss Calkins: Exception.

The Witness: It has had no effect on the regulation of the Wisconsin Michigan Power Company. 3770

By Mr. Browning:

Q. Has the Wisconsin Commission experienced any difficulty in the regulation of these three Wisconsin subsidiaries of the North American Company?

Miss Calkins: Same objection for the same reason.

The Examiner: I will overrule the objection.

Miss Calkins: Exception.

The Witness: We have had no difficulties in the regulation of the North American subsidiaries operating in Wisconsin. When I say "no difficulties," I don't mean to imply that there haven't been difficulties in the regulatory problems that apply to these 3771

—1,716—

particular utilities, but regulation, per se, has been no more difficult with these utilities than it has with others.

Mr. Browning: That is all.

3772 *Asel R. Colbert—By Respondents—Cross*

Cross Examination by Miss Calkins:

Q. Mr. Colbert, in speaking of the difficulties of regulating the Wisconsin Michigan group of North American properties, you were referring only to the experience within your personal knowledge since you have been with the Commission, that is, since 1931? A. Yes.

Q. Now, I believe you are the chief of the accounts and finance department of the Commission, is that correct? A.
3773 That is.

Q. In your opinion, are you familiar enough with the work of the other departments to testify that those departments have experienced no difficulty in regulating this particular group of companies? A. Yes.

Q. In referring to the statute passed in 1931, which related to transactions, the authority of the Commission in what might be termed inter-company transactions, do I understand you correctly, in believing that the company does not have to come to the Commission for approval of inter-company transactions, but that the Commission has author-
3774 ity under this statute to inquire into them and to make such

—1,717—

rulings after inquiry as may be necessary? For instance, suppose that one of the companies in this group wished to make an upstream loan to the parent company in any amount, would the company have to go to your Commission to get approval of that transaction, or would your Commission simply inquire into it if it felt that it was desirable to do so? A. Upstream loans isn't a good example, because upstream loans are barred in Wisconsin by statute.

3775

Q. Well, take some other instance of an inter-company transaction. A. A good example might be a servicing arrangement.

Q. Yes. A. The contractual arrangement for the rendering of a service is not valid or effective until the approval of the Commission is obtained.

Q. Well, is that under specific statute which relates only to service contracts as such, or is that under this general statute which relates to the transactions between affiliated companies? A. It is Section 196.52 of Wisconsin statutes, which deals specifically with the relations of utilities with affiliated interests.

3776

Q. Is that a very long section? A. Yes.

Q. I thought maybe it was just a paragraph or two, but

—1,718—

it is two or three pages? A. Yes, it is two or three printed pages.

Mr. Browning: The statute is in evidence.

By Miss Calkins:

3777

Q. Does the Wisconsin Commission regulate only the issuance of securities which are to be sold to the public, or does it also regulate the issuance of securities to an affiliated company? A. It regulates any securities issued by a public service corporation regardless of to whom the securities are issued.

Q. Now, on your direct examination, you stated that the Commission had effectively regulated security issues since 1911. Now, I don't want you to misinterpret my question because I understand that the Wisconsin Commission has

3778 been one of the leaders in the field of regulating public utilities, but I wish you would elaborate upon that, if you can. A. I don't believe I quite understand just what sort of elaboration you refer to.

Q. Well, the word "effectively" is what is bothering me, Mr. Colbert. In the very beginning of your examination, describing generally the work of the Commission, I think you used that exact language, that they had effectively regulated security issues since 1911. A. I see. The question of
3779 the degree of effectiveness of regulation becomes, of course, a matter of opinion. In my judgment, I think our regula-

—1,719—

tion of securities in Wisconsin has been effective.

Now, I know that it has been effective in my opinion since 1931. It is true that you can go back into the history of security regulation in Wisconsin and you can find transactions which occurred, which I would not consider, judged by present-day standards, the best regulation.

I do not believe, however, that the comparison of what happened twenty years ago should be made with what would
3780 be considered good today, but rather that the comparison should be with what happened in Wisconsin as compared with what was happening elsewhere at about the same time.

I believe that our regulation of securities in Wisconsin has been effective as measured or as compared with what was happening elsewhere at about the same time with respect to issues of securities of the public service corporations.

Q. Well, generally speaking—I don't know whether you are familiar enough with the other statutes regulating utility companies in other jurisdictions—but, is it your opinion that

the statutes of Wisconsin give your Commission broader powers than are generally given such regulatory bodies? A. I am not familiar with what the statutes in all other jurisdictions provide, but I do think that our statute in Wisconsin is very broad.

First, it declares that the right to be a public service —1720—
corporation is a special privilege and that the right of supervising and regulating the issuance of securities shall be vested in the state. 3782

We start, then, with the premise that a public service corporation has no vested right to issue securities in Wisconsin. It is privileged to do so upon obtaining the approval of the state. Our statute further provides that the amount of securities which a public service corporation may issue, shall bear a reasonable relation to the value of the property and to each other.

That is, that the classes of securities shall be proportionate, and the Commission is also authorized to consider the proposed undertakings of the corporation and whether the acts which the corporation intends to do are prudent and afford reasonable protection to the purchasers of securities. I think the whole statute might be summed up by saying that its purpose is to assure that the purchaser of the security is afforded reasonable protection. 3783

We, of course, know he is not guaranteed protection.

Q. Mr. Colbert, would you say that during your experience——

(Discussion off the record.)

3784 *Asel R. Colbert—By Respondents—Redirect*

By Miss Calkins:

Q. Mr. Colbert, would you say that during your experience as an employee of the Commission, that the regulation of the issuance of securities by the utilities Commission operating in Wisconsin, has become increasingly effective? A.

—1721—

I think so. I think, in fact, that it has reflected the tenor of the times. That is, that following the collapse of the se-
3785 curities market in 1929, that the public generally, and regulatory bodies as well, were more concerned with securities. They realized that regulation of securities, perhaps, should be more stringent than it had been in the past.

Now, we haven't any more statutory power today than we had in 1911 with respect to the regulation of securities. There has been some modifications in the statute during that period but essentially it is the same statute.

I believe the administration of it has reflected to a certain extent the tenor of the times and that it has been better in the last ten years than it was in the preceding ten years.

3786 Q. I believe you testified on direct examination, but since I am not sure, I will ask you: Are your Commissioners elected or appointed? A. They are appointed by the Governor with the confirmation of the Senate.

Q. For a six-year term? A. For a six-year term.

Miss Calkins: I think that is all.

(Discussion off the record.)

—1,722—

Redirect Examination by Mr. Browning:

Q. Counsel asked you certain questions with regard to the effective regulation of utilities and in your replies you dis-

cussed certain comparisons and tests, such as the test of Wisconsin against other states. Do I understand correctly that your experience is that the state can effectively regulate the activities of the utility company if it chooses so to do?

Miss Calkins: We object to that on the ground that it calls for a conclusion of the witness.

The Examiner: I think that calls for a conclusion of the witness.

Mr. Browning: Mr. Examiner, it certainly does 3788
call for a conclusion. This witness is an expert witness and he is testifying as to his opinions. It is entirely proper in this case for the witness to give conclusions.

The Examiner: Read the question to me again.

(Whereupon, the pending question was read by the reporter.)

The Examiner: I think that that question is proper on cross examination and I overrule your objection.

Miss Calkins: Well, this is redirect. 3789

The Examiner: Well, he is touching on some matters that you brought out in your cross examination as I get this question.

Miss Calkins: I have no objection to the question if it could be modified to the extent of asking for this

—1,723—

witness' opinion based upon his experience.

Mr. Browning: I submit that the question is proper as framed.

The Examiner: I will overrule the objection.

3790

Miss Calkins: Exception.

The Witness: I think the State of Wisconsin has ample power to effectively regulate its Wisconsin utilities.

By Mr. Browning:

Q. And in your opinion, the State of Wisconsin does effectively regulate its public utilities?

Miss Calkins: Same objection for the same reason.

3791

The Examiner: I make the same ruling and you may note your exception.

The Witness: Considering the regulation of utilities as a whole, in my opinion, it has been and is relatively effective. They have not attained perfection in regulation and perhaps we never will, but I think it has been a reasonable and effective regulation.

By Mr. Browning:

Q. Do you feel that any other regulation of your Wisconsin utilities is necessary?

3792

Miss Calkins: Objected to on the ground that it is incompetent, irrelevant and immaterial.

The Examiner: I sustain the objection.

—1,724—

Mr. Browning: Mr. Examiner, it seems to me that, in the first place, the witness is amply qualified to express an opinion on that, and in the second place, that the cross examination was directed to the effectiveness of regulation. The cross examination brought

out certain tests and comparisons. I submit that the question is proper.

Miss Calkins: Cross examination was directed exclusively to an elaboration or explanation of the witness' statement on his direct examination.

Mr. Browning: The Witness is certainly entitled to express his opinion as to effective regulation of utilities.

The Examiner: Yes, but your question asks him if other legislative regulation will improve the situation. It seems to me that is outside of the scope of this hearing and it is irrelevant. That was the basis of my ruling. 3794

Mr. Browning: I think it is very much within the scope of this hearing, Mr. Examiner, because you are trying here, issues which are going to involve not only questions of statutory construction, but questions of constitutionality.

One of the frequently reiterated phrases in this Act is the effectiveness of state regulation. My questions are directed to that subject. 3795

I will reframe the question to replace the last question.

By Mr. Browning:

Q. In your opinion, is any other regulation of the Wis-

—1,725—

consin utilities necessary in addition to that which is now being administered by the Wisconsin Commission?

3796

Colloquy

Miss Calkins: Objected to on the grounds that the opinion of the witness on that subject is incompetent, irrelevant and immaterial.

The Examiner: I don't see much, if any, difference between the question as you reframed it and the original question, and I sustain the objection and if you care to make an offer of proof for the record, you may do so, Mr. Browning.

Mr. Browning: Might it be better to let the witness

3797 answer with a motion to strike?

The Examiner: Yes. What have you to say to that, Miss Calkins?—to let the witness answer the question subject to a motion to strike on your part later on?

Miss Calkins: In addition to the objection that the question is irrelevant, immaterial and incompetent, I should also like to add that I further object on the grounds that the witness is not qualified to answer.

The Examiner: Well, I think the suggestion is a good one, the suggestion of counsel is a good one, and

3798 I will overrule your objection subject to your right to strike the response if you care to enter it later on.

Mr. Browning: Will you read the question?

(Whereupon, the pending question was read by the reporter.)

The Witness: The question is very broad and has tremendous implications involved. In some respects,

—1,726—

it may be that regulation other than the state is unnecessary. In other respects, joint jurisdiction over

3799

some phases of the utilities operations may be desirable.

I don't think that one can answer the question categorically yes or no.

To illustrate, I believe that under our Wisconsin statute, we have very broad, very comprehensive jurisdiction, over the issues of securities of public utility companies, and in order to assure reasonable protection to purchasers of those securities, no further jurisdiction would be necessary.

3800

There are other phases of the utilities operations involving transactions with affiliated interests where additional regulation might be in the public interest.

There are cases of the interchange in power, movement of power over state lines into adjoining districts, where the situation might call for further regulation.

I just can't answer that question categorically, yes or no, because it is just too much involved.

Mr. Browning: That is all.

3801

Recross Examination by Miss Calkins:

Q. I believe you testified on direct examination, Mr. Colbert, that for some period of time you were associated with the Federal Trade Commission during its investigation of holding companies and their subsidiaries prior to the enact-

—1,727—

ment of the Public Utility Holding Company Act. Is that correct? A. I was with the Federal Trade Commission for three years.

3802

Q. What was the nature of that investigation? A. I worked in the investigation of Electric Bond & Share Company, Middle West Utilities, United Public Service Corporation, United Public Utilities, Central Illinois Public Service Corporation, and a number of other utilities whose names I don't recall.

Q. Was that work primarily of an accounting nature? A. Yes.

Q. In your opinion is the regulation provided by the Pub-
3803 lic Utility Holding Company Act of 1935 unnecessary?

Mr. Browning: Just a minute. Go ahead.

The Witness: Well, that is another one of those very broad questions that I certainly could not answer yes or no to.

Congress has deemed it necessary to pass this Act and we have it as a statute and there are many, many portions of that Act that I think are in the public interest.

By Miss Calkins:

3804

Q. But you don't subscribe to all parts of it, is that correct? A. I don't think so, but I think, in general, I am very

—1,728—

much in sympathy with the Act, and with what is intended to be accomplished.

Q. Mr. Colbert, are you the author of a recent publication in the Public Utilities Fortnightly—I don't know the exact title of it, but it deals with usurpation of state power by S. E. C. regulation. A. I am the author of that article, the title of which is "The S. E. C. Limits State Jurisdiction."

The Examiner: You may retire. That is all, Mr. Colbert.

(Witness excused.)

The Examiner: Let's have a little recess before we take up anything further.

(Whereupon, a short recess was taken.)

The Examiner: Let us resume.

3806

Whereupon, EDWARD H. SCHMIDTMAN resumed the stand and testified further as follows:

Direct Examination by Mr. Hamilton (Continued):

Q. Mr. Schmidtman, prior to the last adjournment, you were in the process of commenting on Respondents' Exhibit No. 37, which is the exhibit with reference to average price of residential electricity. Had you finished your comment? A. No, I hadn't. I should like to add to what I have already said on this exhibit a few more comments. 3807

—1,729—

It will be noticed that prior to 1916, the average price of residential electricity sold by Wisconsin Electric Power Company was at about the same level or slightly higher levels than that for the United States as a whole, but that following the year 1916, the average price for Wisconsin Electric Power Company was substantially below the national average.

3808 *Edward H. Schmidtman—By Respondents—Direct*

In 1910, the average price per kilowatt hour of residential electricity on the system of the Wisconsin Electric Power Company was 11.4 cents.

In 1939, it had dropped to 3.01 cents per kilowatt hour. The reduction during the period shown by Exhibit 37 on the system of Wisconsin Electric Power Company was steadily, although not entirely, uninterruptedly downward.

A rise occurred in the years following 1917, coming about as a result of increased costs resulting from the World War.

3809 Similar data for Wisconsin Gas & Electric Company, and Wisconsin Michigan Power Company are not available over the period of years covered by this exhibit inasmuch as those companies, up until quite recently, did not segregate residential sales as a separate class of service in their statistics.

The residential sales were included with the general classification called "lighting," and for that reason, it is impossible for us to give statistics over this period for those two companies. We do have the data for the year 1939, however, which show that——

3810 —1,730—

Q. (Interposing) I think you have given the figures for 1939. A. Oh, have I given that? I am sorry. I didn't mean to repeat.

Q. What are the rates provided for large industrial users in the territory? A. Large industrial users in the territory served by our three companies are given attractive rates. I have pointed out before that our managements believe that low industrial rates are of great importance in the over-all service rendered to our communities by our companies. In

attracting industries to our districts, such rates actually contribute to the general welfare.

In line with that policy, the industrial rates of our companies have been kept at as low levels as would be consistent with reasonable earnings on the class of service rendered.

Wisconsin Electric Power Company serves the largest industrial load of the three companies and because of the concentration and magnitude of that load is able to offer 3812
the lowest industrial rates of the three companies.

The industrial rate of Wisconsin Electric Power Company is applicable to customers taking service at primary voltages of 3,800 volts, 13,200 volts, or 26,400 volts, who furnish their own sub-stations for stepping-down the voltage to voltages at which they can use the energy in their plants, and who guarantee a minimum demand of 100 kilowatts.

—1,731—

The rate offered to such customers has a demand schedule and an energy schedule. The demand schedule has two parts, one specifying certain peak hours for which a certain 3813
demand schedule applies, and the other part specifying a different schedule for the off-peak hours.

The demand charge which is made for demands which the customers place on the company system during the specified peak hours, start with $1.90 per kilowatt per month for the first 200 kilowatts of demand. Then they follow with $1.50 per kilowatt per month for the next 1,800 kilowatts demand, $1.25 per kilowatt per month for the next 2,000 kilowatts of demand, and $1.00 per kilowatt per month for all demands in excess of 4,000 kilowatts.

The off-peak demand charge which is offered to customers as an inducement to get them to make their heavier demands during the hours of the day when the over-all peaks on the system are not at their maximum, begins with a rate of $1.00 per kilowatt per month for the first 200 kilowatts of demand and 75 cents per kilowatt per month for all demands over 200 kilowatts.

The operation of the off-peak provisions of our industrial primary rate has had a marked effect on the time of
3815 occurrence of the peak demands on the system of the company.

Some years ago, it was a regular thing for the peak demands to occur in the afternoon or evening hours, whereas today we have normally anywhere between eight and ten or

eleven of the monthly peaks in the year during the morning hours of the day.

This is due to the shifting of the industrial peak from the evening peak hours to the morning hours and this shift-
3816 ing of the peak has come about as a result of the operation of the off-peak provision of the industrial schedule.

Now, this provision of the schedules is not peculiar to our companies, but we feel that it has been of great value to us in making it possible for us to serve the loads we are now carrying, with less generating and transmission capacity than would be required if that shift had not occurred.

The consumption might be the same as it is today, but still without the off-peak provisions of the industrial rate, the company would have to provide, in addition to the capacity now used during the evening peaks, sufficient capacity

to carry that load which has been shifted from those hours to other hours of the day.

The energy charge of the industrial rate begins with a first step of 25,000 kilowatt hours per month, for which the charge is 1.25 cents. The next step——

Q. (Interposing) Per kilowatt hour? A. Yes; per kilowatt hour. The next step of 25,000 kilowatt hours per month is charged at the rate of 1.1 cents per kilowatt hour.

—1,733—

The next 50,000 kilowatt hours per month are billed at 3818 one cent per kilowatt hour.

The next 50,000 kilowatt hours per month are billed at .9 of a cent per kilowatt hour.

The next 50,000 kilowatt hours per month are billed at 8/10 cents per kilowatt hour.

The next 100,000 kilowatt hours per month are billed at .7 of a cent per kilowatt hour.

The next 700,000 kilowatt hours per month are billed at 65/100 of a cent per kilowatt hour.

The next 1,000,000 kilowatt hours per month come at .6 3819 of a cent per kilowatt hour.

And the next 2,000,000 kilowatt hours per month are billed at 58/100 cents per kilowatt hour, and all in excess of 4,000,000 kilowatt hours is billed at a rate of 55/100 cents per kilowatt hour.

Q. Are these energy charges to which you refer applicable whether energy is taken off-peak or on-peak? A. Yes, there is no distinction in the energy schedule as between off-peak or on-peak consumption. That distinction is drawn only in the case of the demand charge.

3820 The rates I have just given are gross and all bills rendered under this schedule of rates are subject to a standard discount of 5 per cent. on the first $25.00, and 1 per cent. on all amounts in excess of $25.00.

—1,734—

The bills are also subject to adjustment for cost of coal. The basic charge in the rates is founded on a coal cost of 20 cents per million B. t. u. at the power plants, and the bills are adjusted in direct proportion to the amount by which
3821 the actual coal cost exceeds or falls below the stand of 20 cents per million B. t. u.

For a number of years, in fact as long as I have been with the company, the coal factor adjustment has always been a credit to the customer; that is, our coal cost has been below 20 cents per million B. t. u.

The bills are also subject to an adjustment which rewards the customer for maintaining a power factor in excess of 80 per cent. This adjustment is applied as a direct reduction of the demand in direct proportion to the amount by which his power factor exceeds 80 per cent.

3822 The bills are also subject to a load factor clause which rewards the customer for maintaining a use of maximum demand in excess of 200 hours per month. That is, if the customer's kilowatt hour consumption is divided by his maximum measured demand during the month, and the quotient exceeds 200, his demand charge is reduced in accordance with the amount by which his hours use exceeds 200.

This provision is put into the rate to encourage more continuous use of the demands imposed upon the system, or another way of putting it would be to say to encourage the

customers to take their consumption at lower maximum
—1,735—
demands.

The industrial power rate has a provision which specifies that after the application of the standard rate schedule and the coal factor and power factor adjustments and the load factor adjustment, if any is earned, the net bill shall not be less than 75/100 of a cent per kilowatt hour.

Several of our large customers earn an average rate of 3824
75/100 of a cent per kilowatt hour.

Q. That includes both the demand and the energy charge? A. Yes, that is the total net bill after all adjustments and after discount.

Q. Have the companies in the Wisconsin-Michigan group, from time to time, acquired small public utility systems? A. Yes. During the history of the three companies of the Wisconsin-Michigan group they have acquired an appreciable number of small utility systems.

Q. And what has been the effect upon the rates applicable to those communities after the acquisition by the companies 3825
in the Wisconsin-Michigan group? A. In every case of acquisition of a small electric utility system by one of the companies of the Wisconsin-Michigan group, the effect has been a reduction of the rates charged for electric service immediately upon acquisition.

It has been the policy of the companies to immediately place into effect in the territory of such acquired systems,
—1,736—
the rates applicable to such territory on the system of the acquiring company and in every instance, the change has been

3826 *Edward H. Schmidtman—By Respondents—Direct*

in the direction of reducing the charge for electric service to the customers of the system acquired.

Mr. Hamilton: May this table be marked for identification as Respondents' Exhibit No. 38?

The Examiner: Yes.

(The table referred to was marked for identification as Respondents' Exhibit No. 38.)

3827 *By Mr. Hamilton:*

Q. Mr. Schmidtman, will you explain what Respondents' Exhibit No. 38 for identification purports to portray? A. Exhibit No. 38 is a tabulation listing the communities in which local distribution systems have been acquired by the three companies of the Wisconsin-Michigan group and showing the net bill for residential monthly consumption of 40 kilowatt hours immediately prior to acquisition, immediately after, and the net saving resulting from the change in rates.

Q. And the percentage of saving? A. And the percentage of that saving.

3828

Q. Has this table been prepared under your supervision? A. Yes, it has.

Q. And the facts shown are taken from the records of the respective companies? A. They were.

—1,737—

Mr. Hamilton: I offer it in evidence as Respondents' Exhibit No. 38.

Miss Calkins: No objection, but I would like to ask the witness if each of the names in the right-hand

column represent separate towns or communities and separate systems?

The Witness: You mean the left-hand column, don't you?

Miss Calkins: Yes.

The Witness: The names represent communities and in some instances more than one community was covered by the same system acquired. That is, each name given in the list does not represent a separate system. 3830

In many instances one community does represent one system. In some instances more than one community was covered by the same system.

The Examiner: Are you through, Miss Calkins?

Miss Calkins: Yes, I said no objection to the admission of the exhibit.

The Examiner: The tabulation is now received in evidence under the number mentioned.

(The table referred to was received in evidence as Respondents' Exhibit No. 38.)

3831

By Mr. Hamilton:

Q. Do you care to comment on this exhibit, Mr. Schmidtman? A. Yes. There are a few comments that might be made.

—1,738—

The five communities listed under Section A of this tabulation, "Utilities acquired by Wisconsin Electric Power Company," were served by local electric utility systems which were acquired during the period from 1913 to 1930. These

were all private utility systems except that at Port Washington, which, prior to acquisition by Wisconsin Electric Power Company, was operated by the City of Port Washington.

The communities listed in Section B of the exhibit were served by local utilities acquired by Wisconsin Gas & Electric Company during the period from 1916 to 1931.

The last one to be acquired by that company was that at West Bend.

3833 The communities listed under Section C of this exhibit were served by local utilities which were acquired by Wisconsin Michigan Power Company during the period from 1923 to 1929. Most of these acquisitions, as I have just pointed out, were made a number of years ago and numerous rate reductions have been made in these communities since the dates of their acquisition by the companies of the Wisconsin-Michigan group.

Such rate reductions are not reflected in this tabulation, however, inasmuch as the purpose of this exhibit was to show the effect on rates of the changes from the schedules in effect

3834 immediately prior to acquisition, to the schedules of the acquiring companies immediately after acquisition.

Q. Expressed in terms of percentages, will you state very

briefly the range indicated by the exhibit of savings to customers? A. Yes. The savings to the customers in the communities served by the systems which were acquired by Wisconsin Electric Power Company ranged from 12 per cent. in Port Washington to 56 per cent. in the Village of Dousman.

In the case of Wisconsin Gas & Electric Company, the saving in the twenty-six systems acquired ranged from a mini-

mum of 19 per cent. in West Bend to the maximum of 73 per cent. in the community of Bristol.

In the case of Wisconsin Michigan Power Company, which acquired systems in twelve communities, the savings ranged from 18 per cent. in the communities of Loretto, Michigan, Niagara, Wisconsin, and Alpha, Michigan, to a maximum of 51 per cent. in the communities of Powers and Spalding, Michigan.

In the case of Powers and Spalding, the communities were served by the same system prior to acquisition, but that was 3836
not true in the case of the three communities in which the 18 per cent. saving was made. They were all separate systems, although the rates in effect prior to acquisition happened to be the same.

I should also add here that the monthly consumption of 40 kilowatt hours which was used in computing these bills was selected as a typical consumption for customers on those systems at that time.

—1,740—

The rates under which the net bills prior to acquisition, 3837
and the net bills immediately after acquisition, were computed, were filed rates.

Q. What has been the record of the companies in the Wisconsin-Michigan group with respect to rate reductions? A. The rates charged for electric service by the three companies of the Wisconsin-Michigan group have been reduced on a very impressive scale for a period of years. Since May 1, 1926, Wisconsin Michigan Power Company has made one or more reductions in its electric service rates in every year except 1930.

The savings to customers resulting from those rate reductions of which there were fifty-eight, amounted to at least $2,569,600.00 accumulated up to June 30, 1940.

Q. Now, will you explain the basis on which you arrived at the figure you have just given? A. Yes. I stated it as being at least that much because of the method that was used in computing the figure. At the time each rate reduction was made, a calculation was carried out to determine the amount of the reduction in revenue which would result from
3839 that rate change in terms of the number of customers taking service under the rate affected and the consumption of those customers.

The saving computed on that basis for each rate change, as indicating the annual saving to the customers, has been multiplied by the period of time elapsed since the date of the

change, and the total of those figures is the $2,569,600.00. The reason this figure represents appreciably less than the actual saving realized is that it is built up of amounts based on the number of customers affected at the time the rate was
3840 changed, and the amount of energy consumed by those customers at that time.

Now, both of those elements have changed considerably since the time of the rate change, particularly in the case of changes that were made a number of years ago.

The number of customers on the schedules affected by these rate changes has increased and the consumption of the customers who were taking service at that time has increased, but this saving does not recognize those changes because the determination of their effect on the saving would be a very involved computation requiring considerable re-

search and we have felt that rather than to go to the labor of computing this change in number of customers by classes and the consumption of customers, and the effect of the various steps of the rate, that we are more conservative in stating the minimum figure.

Just how much the actual saving would exceed the figure I have given, I am not prepared to say, but a computation of this general type was made on another utility system some years ago and the indication was that the actual saving was several times that computed on the basis we have used 3842 here.

—1,742—

Q. Have you comparable data for Wisconsin Gas & Electric Company? A. Yes, I have. Since 1921, through to the end of 1939, Wisconsin Gas & Electric Company has made one or more rate reductions, in every year.

The total number of reductions made during that period is eighty-four and the accumulated saving to the customers, based on the same method of calculation as that I have just described for Wisconsin Michigan Power Company, amounted to $8,685,500.00. 3843

For Wisconsin Electric Power Company, the number of reductions made since May, 1921, is eighty-seven. One or more reductions have occurred in every year except 1923. The accumulated saving to the customers of that company, down to June 30, 1940, amounts to $38,292,487.00.

Here, again, this figure is computed on the basis I have described and the actual saving, recognizing increased use and increased number of customers, would be substantially greater than this figure if we were able to compute it.

3844 *Edward H. Schmidtman—By Respondents—Direct*

Q. At what date have you computed the accumulated savings for Wisconsin Gas & Electric Company? A. To June 30, 1940.

Q. Have any of the companies in the Wisconsin-Michigan group had in effect a so-called free electricity plan? A. Yes. Wisconsin Electric Power Company, and Wisconsin Gas & Electric Company placed into effect what was called the

—1,743—

free electricity plan in the year 1934, and Wisconsin Elec-
3845 tric Power Company offered the plan again to its customers in 1935.

Q. Will you explain what that plan was? A. This plan was something quite new as a means of promoting the increased use of electricity by customers of a utility system. The plan consisted of an offer under which the customers, whose use normally declines in the summer and consists principally of lighting, were given permission to use an unlimited amount of electricity in the months of May and June of each of those years, with the understanding that their
3846 charge for service would be no higher than it was in March.

Q. Of that same year? A. Of that same year. The purpose of this plan was three-fold. Firstly, it was intended to stimulate the greater use of electricity by our customers through giving them an opportunity to use the service more freely; that is, to develop a more liberal use of electricity, to develop higher consumption habits.

Second, the companies hoped to achieve a permanent increase in consumption from the additional appliances which the customers would naturally buy and use during the free electricity period; and

Third, it was intended to avoid the usual seasonal decline in consumption of electricity at that time of year.

Now, it was possible to carry this plan out because of the

—1,744—

availability of surplus hydro-electric power from the system of the Wisconsin Michigan Power Company. The plan was offered to residential, rural, and commercial lighting customers, whose use, as I have stated, normally varies with the seasons.

Combined light and power customers of the commercial 3848
class, whose use was largely lighting, were also given the privilege of participating under the free electricity plan. This plan proved to be a very effective means of increasing the consumption of electricity by the customers of the companies.

It resulted in a more extensive use of the service through longer hours of furnishing of light and use of appliances, and through the purchase and use of additional appliances which the customers did not have before the plan went into effect.

Statistics were kept on the operations of the plan in 3849
both the years 1934 and 1935, and those statistics show that in 1935, the acceptance of the plan as measured by the number of customers availing themselves of it, and the extent to which they made use of the free service, was considerably higher in the latter year.

In 1934, a total of 62,186 customers, or 29 per cent. of the customers eligible to take free electricity, actually participated in the plan.

Now, those 62,000 were made up as follows: 53,304 were residential customers, representing 28 per cent. of the resi-

3850 dential customers of Wisconsin Electric Power Company; 1,616 of the rural customers participated, representing 53

—1,745—

per cent. of the rural customers; 7,266 commercial customers, representing 31 per cent. of the customers in their class, participated in the plan.

In the same months of 1935, that is in the months of May and June, the participation was appreciably higher, including 71,590 residential customers, or 36 per cent. of the
3851 class; 1684 rural customers, who were 57 per cent. of the eligible rural customers; and 9,171 commercial customers constituting 39 per cent. of the eligible commercial customers; total number of customers participating in 1935 was 82,445, which were 37 per cent. of the total number of customers eligible to take the service.

In 1935, the number of participating customers not only increased, but the participating customers made more extensive use of the free service than did those participating in 1934. In 1934, the average customer participating in the
3852 plan received 107 kilowatt hours of free electrical energy. In 1935, the average participating customer used 166 kilowatt hours of free energy.

In 1934, the participating customers used a total of 6,624,649 kilowatt hours of free electricity.

Had this electricity been billed at regular rates as an addition to the consumption the participating customers took in March, the revenue for that service would have amounted to nearly $201,000.00.

—1,746—

3853

In May and June of 1935, the free consumption was more than twice as great as that in 1934, amounting to 13,685,582 kilowatt hours.

If this energy had been billed at regular rates, it would have cost the customers over $371,000.00. The average free electricity taken by the participating customers in 1934, as I have stated, amounted to 107 kilowatt hours, and would have cost $3.25 at the standard rates.

In 1935, the average participating customer received 166 kilowatt hours of free energy which would have cost him $4.50 if he had been billed for that service at the regular rates.

3854

When I speak of 1935 in this respect, I mean the months of May and June. The use of free service in the months of May and June, 1934, constituted an average increase of 51 per cent. over the billed consumption in those months, while in May and June of 1935 the free service taken by the participating customers amounted to 90 per cent. of the consumption for which they were billed in those months.

In 1934, the free electricity plan was offered for only the two months of May and June. It was based upon the bills for service rendered in March because it took some time to get the plan under way and properly advertised so the customers of the companies offering it would know it was about and how they would go about taking advantage of it.

3855

It was necessary to base the charges under the free elec-

tricity plan on a month for which the bills had already been rendered in order to avoid a situation in which customers planning to avail themselves of the opportunity would reduce

3856 *Edward H. Schmidtman—By Respondents—Direct*

their consumption in the base month in order to establish a low basic charge.

For that reason, March was used. The month of April was occupied in developing the plan and presenting it to the customers, and in the months of May and June, it went into effect.

Q. Are these statistics, which you have given, applicable only to the experience of the Wisconsin Electric Power Company? A. Yes, they are.

3857 Q. They do not include the experience of the Wisconsin Gas & Electric Company? A. No.

Q. And did the plan accomplish the purposes which it was intended to accomplish? A. Yes, it did. It was so successful in 1934 that Wisconsin Electric Power Company decided to offer it again in 1935.

After the months of May and June in 1935 had passed, the plan was still working so successfully as a means of changing the habits of customers with respect to use of electricity, and, as I will point out later, as a means of increasing the sale of major appliances, that the manage-

3858 ment of Wisconsin Electric Power Company decided to extend it on through the summer.

—1,748—

That was done and the plan was extended from June to October in 1935.

The usual seasonal decline in consumption of lighting customers which occurs during the summer months had some effect on the extent of participation in the plan during the summer months and the number of participating customers dropped off somewhat from the number that had participated in May and June.

The average for the six-months' period for 1935 indicates that 58,520 residential customers, or 30 per cent. of their class participated; 1,244 rural customers, or 42 per cent. of their class participated; and 9,148 commercial customers participated, representing 39 per cent. of their class.

The total number of participating customers in the average month for the six-months' period, was 68,912 and constituted 31 per cent. of the total customers eligible to participate under the free electricity plan.

3860

During the six-months' period, the customers participating in the free electricity plan in 1935, used a total of 32,636,346 kilowatt hours of free electricity.

Q. This is total for 1935? A. This is total for 1935, yes, the six-months' period. This amount of free electricity was equal to 79 per cent. of the electricity for which those participating customers were billed in that period.

The average residential consumer participating in the plan used free electricity amounting to 127 per cent. of the energy for which he was charged. The average rural customer used free electricity amounting to 159 per cent. of his billed consumption, and the average commercial customer used free electricity equal to 36 per cent. of the energy for which he was billed. 3861

If these amounts of free electricity had been billed to the customers at regular rates, the total revenue for the six months in 1935, from the service which was rendered free, would have been $850,427.00, which would be at an average of $12.34 per participating customer.

3862 *Edward H. Schmidtman—By Respondents—Direct*

Q. What effect, if any, has the operation of the plan had on the consumption of electricity in periods subsequent to the operation of the plan? A. It has had a material effect in increasing the consumption of the customers in those classes to which the free service was available.

During the period in which the free electricity plan was effective, a marked increase in the sales of electric ranges and electric water heaters was observed.

During the months of April, May and June of 1933, which
3863 was the year prior to the offering of the free electricity plan, Wisconsin Electric Power Company sold 139—no, not Wis-
—1,750—
consin Electric Power Company—there were sold in the territory of the Wisconsin Electric Power Company, 139 electric ranges.

During the months of April, May and June of 1934, when the free electricity plan was introduced, the range sales totaled 349, and during the same months of 1935, 544 ranges were sold.

In 1933, during those months of April, May and June, 57
3864 water heaters were sold. In 1934, that number was increased to 206. In 1935, it dropped off slightly to 186, but was still substantially above the figure prior to the offering of the free electricity plan.

In the period from April to October, inclusive, in 1934, that is, covering the entire period of the plan in the year 1935—in 1934, there were sold 665 ranges and in 1935, 944.

In 1934, there were sold 369 water heaters, and in 1935, this was increased to 491.

We feel that the free electricity plan was a major factor in accomplishing this increased sale of these major electrical

appliances, and the operation of the plan can be seen in that while these appliances were sold to customers who were taking advantage of the free electricity plan, they are continued in operation down through to the present time and will continue to be an effective factor in holding up the sale of electricity to these classes of service.

The consumption of the customers was also materially in-

creased during the period of the free electricity plan. In 3866
1933, the average consumption per residential consumer of Wisconsin Electric Power Company was 637 kilowatt hours.

In 1934, that had increased to 707. In 1935, that had further increased to 816 kilowatt hours.

Q. Is that entirely revenue consumption or does it include kilowatt hours taken under the free electricity plan? A. It includes kilowatt hours taken under the free electricity plan. It represents total sales to customers of that class. In the case of rural customers, a similar increase in consumption took place during the free electricity plan.

In 1933, the average consumption per rural customer 3867
was 1,146 kilowatt hours. In 1934, that had increased to 1,311 kilowatt hours; and in 1935, it had further increased to 1,671 kilowatt hours.

Q. Now, without going into detail, would you indicate very briefly whether the net effect of the plan is an increase in revenues? A. Yes, the net effect of the plan was an increase in revenues to the company, in an immediate sense. That is, during the period in which the plan was effective, it resulted in increased net revenues to the company. It has been estimated that the increased revenues received by Wis-

3868 *Edward H. Schmidtman—By Respondents—Direct*

consin Electric Power Company during the period of free electricity in 1934, exceeded the increased costs of conducting the plan by $34,000.00 and that during the six months in

—1,752—

which the plan was effective in 1935, the revenue exceeded the increased costs by $53,000.

Now, these are only the immediate effects of the plan and are in no sense a complete measure of the over-all results achieved by offering this plan to our customers because, as I
3869 have pointed out, the habits of the customers have been changed. They are acquiring more appliances and both of those factors continue to result in higher consumption than was realized in the period prior to the offering of this plan.

Q. When did the plan end? A. The free electricity plan was discontinued in October, 1935.

Q. And was another plan substituted for it? A. Yes, it was.

Q. What is that plan? A. At that time, at the beginning of November, 1935, the Wisconsin Electric Power Company offered a promotional plan which was a substitute for the free
3870 electricity plan.

This new promotional plan is known as the ten-for-one plan.

Q. That plan is still in operation? A. Yes, it is still in operation, today.

Q. Will you explain how it operates? A. The ten-for-one plan permits eligible customers to double their consumption of electricity in any calendar month, or rather any service

—1,753—

month, of a given year as compared with their consumption in that same month the previous year for an increase of

not more than 10 per cent. in the electric service bill.

To illustrate, if a customer used 100 kilowatt hours in the month of August, 1939, and paid for it at the standard rates, he would be permitted under this plan to use up to 200 kilowatt hours in August of 1940 at an increase of not more than 10 per cent. over the bill he paid for his service in August of 1939.

If a customer increases his consumption to more than twice the consumption of the corresponding month a year ago, he is billed for that excess over the 100 per cent increase 3872
at a net rate of 2 cents per kilowatt hour.

Another provision of the plan is that under no circumstances shall the charge for electric service to a customer under the ten-for-1 plan exceed what the charge would be at the regular rates presently in effect, nor shall it be any less than one cent net per kilowatt hour.

The ten-for-one plan is offered to residential, rural and commercial lighting, large users secondary, and municipal secondary customers.

It has received remarkably wide acceptance on the part of the customers and is still in effect. 3873

Mr. Hamilton: May this table be marked for identification as Respondents' Exhibit No. 39?

The Examiner: Yes. —1,754—

(The table referred to was marked for identification as Respondents' Exhibit No. 39.)

By Mr. Hamilton:

Q. Mr. Schmidtman, will you explain what Respondents' Exhibit No. 39 for identification purports to portray? A.

3874 *Edward H. Schmidtman—By Respondents—Direct*

Respondents' Exhibit 39 is a tabulation showing the amounts saved by the customers of Wisconsin Electric Power Company through the operation of the ten-for-one plan during the years 1935 to June 30, 1940.

Q. And for what period in 1935? A. For the period in 1935 during which the plan was effective, namely November 1, to December 31.

Q. Will you explain the basis on which savings are shown? A. The savings shown in Exhibit 39 were com-
3875 puted from the bills rendered to the customers. Under the operation of this plan, a participating customer receives an electric service bill which shows his meter reading, and the consumption, and then the bill for that consumption, at regular rates, is shown.

In an adjoining column, the bill to be paid by the customer under the ten-for-one plan is shown.
